

Purchased

Natural gas is bought from suppliers across North America. Similarly, pipeline-ready RNG is purchased from producers such as farms, municipalities and private facilities.

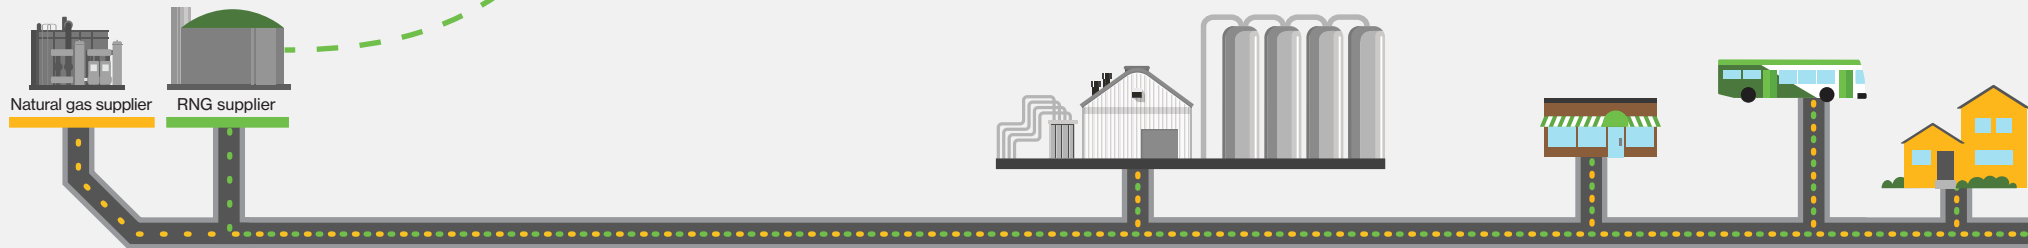

1 m³ RNG

1 m³ conventional natural gas

Adding RNG reduces the carbon intensity of the gas supply by displacing the equivalent amount of conventional natural gas.

Blended

RNG is similar to conventional natural gas, so it can be seamlessly added to the existing pipeline.

Moved

Natural gas and RNG are transported within Ontario via large pipelines.

Stored

RNG and conventional natural gas can both be held at Enbridge Gas' storage facility – before going to customers.

Distributed

Both RNG and conventional natural gas are distributed through a vast network to homes, businesses, fleets and industry.
