ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 5, Schedule 1, pp. 3-5

Question(s):

Enbridge Gas outlines differences in accounting policies related to depreciation at paragraphs 7-12

- a) Please indicate any material differences between the Union Gas, EGD and Enbridge Gas capitalization policies for the following matters:
- i. Overhauls and major inspections
 - ii. Capitalization spending thresholds
 - iii. Definition of minor repairs which are not capitalized
 - iv. Site preparation costs
 - v. Costs incurred to remove previous utility assets when completing interim retirements/replacements
 - vi. Treatment of retirements for assets replaced under insurance or warranties
 - vii. Treatment of retirements for costs incurred for asset removal or relocation under cost-sharing arrangements (such as highway or civic-driven projects which may be funded in whole or in part by local or provincial governments)
 - viii. Treatment of retirements for major natural disasters (e.g., floods, fires, etc.) or other extraordinary retirements
- b) For each of the items in (a) please have Concentric identify if and how any changes were incorporated into the assessment of depreciation lives, dispersion and net salvage in the Depreciation Study.

Response:

- a) The Enterprise Wide Capitalization Policy was implemented in 2018 and Enbridge Gas adopted the policy provided at Exhibit 2, Tab 4, Schedule 1. There are no material differences for the above listed items as the EGD and Union rate zones are following the same capitalization policy. Please see Exhibit 2, Tab 4, Schedule 1, page 9, Table 1 for a summary of APCDA impacts related to the harmonization of capitalization policies for EGD and Union.

b) Please see the response at part a), there were no changes for Concentric to incorporate.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 5, Schedule 1, pp. 6-7

Question(s):

Enbridge Gas indicates that there is significant accumulated amortization variance related to computer assets prior to December 1, 2023, which is proposed to be amortized over the Remaining Life.

- a) Please confirm if the amortization period is the ELG remaining life, the ALG remaining life, or the remaining life calculated based on the newly adopted amortized lives.
- b) Enbridge Gas indicates that “once the last asset is retired for the pools in these pre-existing accounts, depreciation expense will cease on these accounts”. Please indicate the treatment of any residual accumulated depreciation variance at the time of the disposal of the last asset for each pool. For example, if the last asset retires earlier than expected, what will happen to the unamortized variance at that time?

Response:

- a) The amortization period is the ELG remaining life.
- b) Any residual accumulated depreciation variances at the time of disposal will be redistributed to a similar asset account. The residual accumulated depreciation variance will be addressed in the next depreciation study for Enbridge Gas and taken into consideration when determining revisions to depreciation rates.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 5, Schedule 1, Attachment 1 – Depreciation Study

Question(s):

In Section 3.3.2 of the Depreciation Study, Concentric outlines four approaches to addressing costs of net salvage indicating the proposed CDNS approach including: “Methodology relies on more estimates of future inflation and future cost of capital and that are harder to predict and subject to debate.”

- a) Please provide a detailed description of the use of inflation estimates in CDNS as proposed by Enbridge Gas, including whether the discount rates are real or nominal, how the estimated future costs are established (including on a real or nominal basis), and the impact over time if inflation is different (e.g., higher) than assumed in the preparation of CDNS estimates.
- b) Please explain the meaning of “customer equity” in the quote: “Attempts to have more customer equity by passing on the benefit of any return of capital” at page 3-10 of the Depreciation Study.
- c) If costs of removal are estimated via the ratio between nominal dollars spent to remove an item, divided by nominal dollars spent (in the past) to build the item, as is the case in the Depreciation Study’s Section 7, why is it necessary to additionally inflate these values as described in the Depreciation Study, page 3-11?
- d) For account 456, on page 3-13, Concentric notes: “At this time, Concentric recommends that a negative ten percent net salvage estimate continue to be used to form the basis of the CDNS calculations for this account. When the CDNS method is used, the net salvage rate is adjusted to negative six percent for the purposes of depreciation calculations.” Please provide a detailed calculation of the revision from negative 10% to negative 6% for this account.

Response:

The following response was provided by Concentric Energy Advisors, Inc.:

- a) The CDNS method incorporates three components.
- First, a net salvage percentage calculated in accordance with the Traditional method net salvage analysis is prepared. This analysis was included in Section 7 of the Concentric report for each account. The traditional method has an embedded inflation component within the calculation, as the salvage percentage is calculated from dividing the actual cost of removal (net of gross salvage proceeds), which is expressed in the dollar value as at the time of the retirement transaction, by the original cost dollars which are expressed in the value of the dollar at the time of the original installation of the asset. Therefore, the net salvage percentage has an embedded historic rate of inflation over the period from when the asset was originally installed to the year in which it was removed.
 - Second, the above impact of inflation is normalized to put both the original and cost of removal at the same cost base. The CDNS model accomplishes this by first determining a weighted average age of retirement for each account, and then inflating the original cost dollars to the same base as the cost of removal expenditures, and then adjusting the resultant net salvage percentage to an adjusted net salvage rate expressed in the dollars of the study date, resulting in an adjusted salvage rate in a current cost net salvage ratio.
 - The future net salvage requirement is multiplying the Adjusted Original Cost by the Adjusted net salvage percentage (all in today's dollars) and then inflating this resultant calculation to the end of the estimated remaining life of the vintage by applying an estimated 2% annual inflation rate, and then discounting this inflated amount back to the study date using a credit adjusted risk free discount rate of 3.75%.

The above historic inflation rates have been determined using the StatsCan historic CPI. The detailed calculations with formulas intact have been provided at Exhibit I.4.5-IGUA-14-Attachment 1.

- b) "Customer equity" in the above quote refers to the concept of fairness to tollpayers. The use of the CDNS method allows for lower depreciation rates without risk to future tollpayers, thereby improving generational equity as compared to some methods of net salvage calculation.
- c) The net salvage ratio as shown in Section 7 of the depreciation study includes the assumption that future inflation will approximate historical inflation. The CDNS

model allows that assumption to be removed, and more precise levels of net salvage to be calculated. The net salvage ratio, as calculated in Section 7, is applied to the uninflated original cost amount by vintage to calculate the net salvage requirement. The original cost amount is then inflated into 2021 dollars, and the net salvage requirement is applied against this number. This adjusted net salvage ratio has removed the impact of inflation and results in a lower ratio to apply going forward. The future net salvage requirement is then inflated to the expected end of life of the vintage and discounted back to 2021 dollars.

- d) Please see response at Exhibit I.4.5-IGUA-14-Attachment 1 for a working model of the CDNS calculations for all accounts.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Exhibit 4, Tab 5, Schedule 1, Attachment 1 – Depreciation Study, Section 6

Question(s):

Concentric provides proposed Life and Dispersion curves for each asset group, based on account experience. Please provide the following alternative life and dispersion curves. In each case, please include the calculated Residual Measure, and exclude vintages with exposures below 1% of total exposures.

- a) Please provide Account 452 using a 45-R2.5 curve
- b) Please provide Account 456 using a 44-R4 curve
- c) Please provide Account 457 using a 40-R2.5 curve
- d) Please provide Account 465 using a 70-R4 curve
- e) Please provide Account 472 using a 45-S0.5 curve
- f) Please provide Account 475.30 using a 60-L2, a 65-R3 and a 60-R4 curve.
- g) Please provide Account 477 using a 45-R2 curve

Response:

The following response has been provided by Concentric:

- a) The calculated Residual Measure for Account 452 using a 45-R2.5 is 0.2695.
- b) The calculated Residual Measure for Account 456 using a 44-R4 is 0.4221.
- c) The calculated Residual Measure for Account 457 using a 40-R2.5 is 0.7606.
- d) The calculated Residual Measure for Account 465 using a 70-R4 is 0.5594.
- e) The calculated Residual Measure for Account 472 using a 45-S0.5 is 0.3579.
- f) The calculated Residual Measure for Account 475.30 using a 60-L2 is 0.4321, using a 65-R3 is 0.2498, and using a 60-R4 is 0.3306.
- g) The calculated Residual Measure for Account 477 using a 45-R2 is 0.3398.

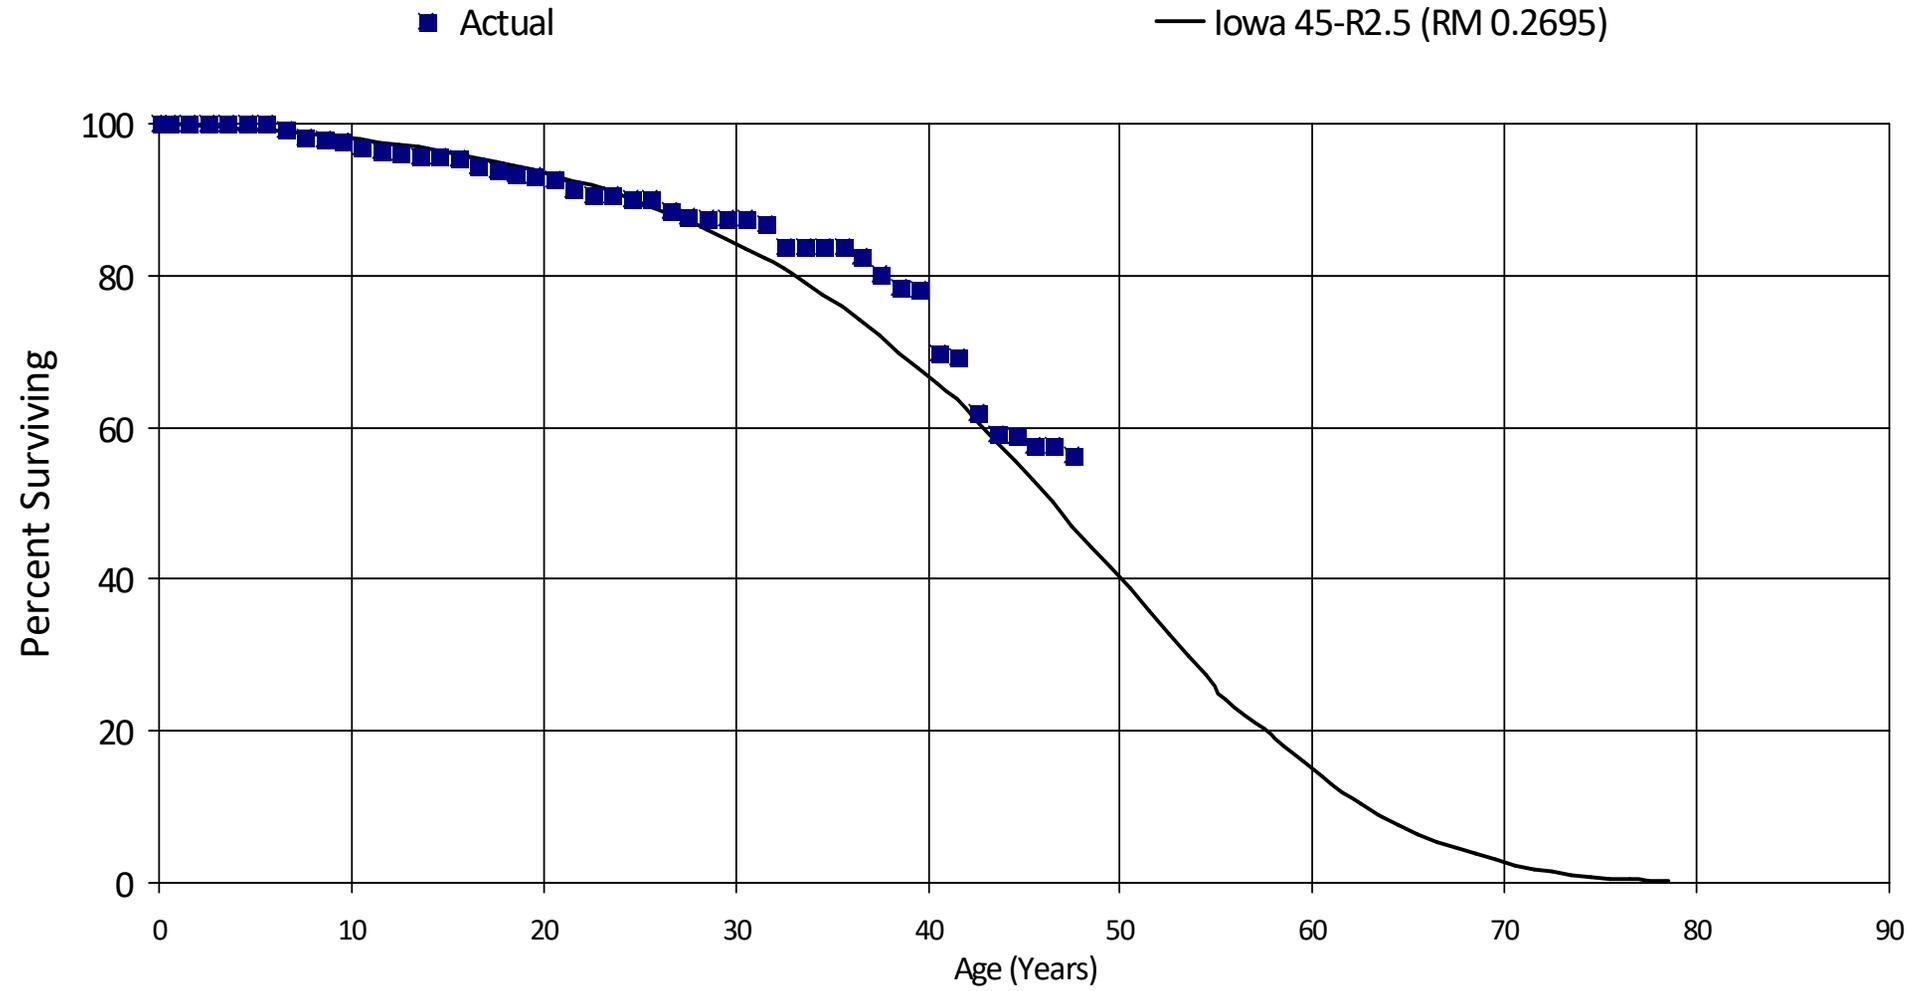

Please see Attachment 1 for the Actuarial graphs and accompanying data for the indicated Life and Dispersion curves above.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Ref 1: Exhibit 4, Tab 5, Schedule 1, Attachment 1 – Depreciation Study, Section 6

Ref 2: EB-2011-0210, Exhibit D2, Foster and Associates – 2011 Depreciation Study

Question(s):

Concentric provides proposed Life and Dispersion curves for each asset group, based on account experience.

- a) Please provide a description of the full range of assets in account 455 and indicate why the retirement experience on this account departs notably from the proposed 55-R3 life and dispersion curve.
- b) Union Gas's depreciation study (Foster and Associates – 2011 Depreciation Study) indicates at page 7 that Union Gas had aged data and plant transactions for all post-1997 activity. Please explain why Account 466 relies on an experience band only from 2010-2021.
- c) Please provide any additional retirement experience data for Account 466 transmission for periods from 1997 to 2010, including in Excel format.
- d) Please provide a description of the assets in account 456 and indicate why the retirement experience on this account departs notably from the proposed 30-R4 life and dispersion curve.
- e) As both peers (35-37 years) and the experienced retirement data (Concentric Depreciation Study, page 6-38) are suggestive of a much longer life for Account 466 Transmission Compressors, please provide a detailed reasoning for adopting the 30-R4 life at this time.
- f) For Account 473.01, per Concentric Depreciation Study page 3-17, the existing EGD life and dispersion of 45-L1.5 appears to be a better fit to the data than the proposed 45-S1. Please provide a copy of the retirement rate analysis limiting exposures to 1% of total exposures and illustrate and calculate RM values for 45-L1.5 and 45-S1.

- g) For Account 475.21, per Concentric Depreciation Study page 3-19, the existing EGD life and dispersion of 61-R3 appears to be a better fit to the data than the proposed 55-R3. Please provide a copy of the retirement rate analysis limiting exposures to 1% of total exposures, and illustrate and calculate RM values for 55-R3 and 61-R3.
- h) As both peers (55-80 years) and the experienced retirement data (Concentric Depreciation Study, page 6-83) are suggestive of a much longer life for Account 475.21 Distribution Mains - Coated and Wrapped, please provide a detailed reasoning for shortening to a 55-R3 life at this time.
- i) Please provide the range of peers (with references) for Account 477.
- j) As both peers (15-25 years) and the experienced retirement data (Concentric Depreciation Study, page 6-100) are suggestive of a much longer life for Account 478 Meters than the 15-S2.5 proposed, please provide a detailed reasoning for shortening to a 15-S2.5 at this time.

Response:

The following response was provided by Concentric Energy Advisors, Inc.:

- a) Enbridge Gas classifies assets based on the OEB Uniform System of Accounts. Account 455 includes the 'cost of pipelines used for conveying gas from point of connection with the transmission or other system to underground storage wells and from underground storage wells to the point where the gas enters the transmission or other system'¹.

The actuarial analysis for Account 455 indicates a stub curve that does not fall below the 80 percent surviving level. As such, the actuarial analysis is of limited value. The peer review indicated a range of 40 to 55 years is appropriate for Field Lines. EGD had a previously approved life of 55-R3 for the assets in this account. Based on the peer review, maintaining the currently approved life of 55 years is appropriate.

- b) At the time of the 2021 Depreciation Study, Concentric did not have historical retirement transactions for any years prior to 2010. As such, the Experience Band selected was 2010 through 2021. Concentric has now received the data and is evaluating the impact, if any, on the results of the study.
- c) Please see response to part b).

¹ [OEB Uniform System of Accounts.](#)

- d) Enbridge Gas classifies assets based on the OEB Uniform System of Accounts. Account 456 includes the 'cost of compressors and associated equipment used to deliver gas to underground storage or to withdraw gas from underground storage for delivery to the transmission or other system.'²

The EGD currently approved life for this account is 40-R2, while the currently approved life for Union is 35-R2.5. The peer review indicates a life of 30 to 40 years is appropriate for this account, while review of the remaining compression accounts in the Enbridge Gas system indicates that peers have a life of less than 40 years. Discussions with operations and management staff indicate that the expected life of compression sites is approximately 40 years. As such, Concentric recommends the 40-R4 for the assets in this account.

- e) When reviewing the actuarial analysis, it is noted that the exposures decrease rapidly from 1 billion dollars at age 0 to \$356 million at age 6.5 without any retirement activity. Further, by age 14.5 the exposures drop to 126 million with only 1.4 million dollars in retirements. That indicates that Enbridge Gas has invested a large amount of money in very recent years. As such, it is expected that the historical data indications may not be representative of the future retirement patterns. Therefore, it is appropriate to place less weighting on the actuarial analysis for this account.

As is noted in the interview notes, attached at Exhibit I.4.5-STAFF-171-Attachment 5, there is an upcoming wave of compressor equipment retirements expected in the coming years. It is anticipated that the new compressors will have a life shorter than the historical life indications. As such, Concentric recommends maintaining the currently approved life of 30 years.

- f) Please see Attachment 1.
- g) Please see Attachment 2.
- h) As is noted in the interview notes, provided at Exhibit I.4.5-STAFF-171-Attachment 5, there is an ongoing replacement program targeting steel mains. This program is anticipated to have a wave of retirements in the coming years, with vintage steel mains planned to be replaced predominantly with plastic mains. As such, Concentric recommends maintaining the currently approved life for Union Gas of 55 years.
- i) Please see response at Exhibit I.4.5-IGUA-26-Attachment 1 for the peer review.
- j) Concentric notes that the actuarial analysis included for this account includes all historic retirement transactions, resulting in a placement band of 1884 through 2021

² [OEB Uniform System of Accounts](#)

and an experience band of 1955 through 2021. In the years since 1884, metering technology has undergone significant changes. As such, minimal weighting was placed on the actuarial analysis completed for this account.

Enbridge Gas is currently investigating an AMI meter replacement program. AMI meters are subject to a differing set of forces of retirement as compared to analogue meters, and as such, it is the experience of Concentric that they generally have a shorter expected life. AMI meters may be retired due to changes in AMI technology (ie. AMI meters using cellular technology may need to be retired if the underlying cellular technology changes), battery constraints, necessary upgrades to encoder receiver transmitters, and a variety of other technological limitations. As such, it is necessary to assign a shorter average life for Enbridge Gas in order to ensure all technological changes including the use of Ultrasonic meters and the potential conversion to AMI are considered.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Consumers Council of Canada (CCC)

Interrogatory

Reference:

Ex. 4/T5/S1

Question(s):

Was the Concentric Depreciation study subject to an RFP process? If not, why not? If so, please provide the RFP and indicate why Concentric was chosen. Was the contractual arrangement with Concentric with respect to the Depreciation Study connected to its work regarding equity thickness? Please provide all correspondence between EGI and Concentric regarding the scope of work expected.

Response:

Please see Attachment 1 for the RFP and response at Exhibit I.1.2-CCC-3 for the contract for the Concentric Depreciation Study.

Concentric was selected to conduct the Depreciation Study due to its extensive subject matter expertise and experience with prior EGD depreciation studies.

The contractual arrangement with Concentric with respect to the Depreciation Study was not connected to Concentric's work regarding equity thickness.

INTRODUCTION

1. PREAMBLE

- (a) This Request for Proposal (“**RFP**”) is being issued by Company to obtain proposals for the goods and/or services (“**RFP Subject**”) described in the RFP data sheet forming part of this RFP (“**RFP Data Sheet**”). The RFP may only be amended by an addendum issued by Company (an “**Addendum**” and, collectively, the “**Addenda**”) which shall, upon issuance, become part of the RFP.
- (b) All instructions required for the completion of a proposal (a “**Proposal**”) in response to this RFP are included in this RFP. Invited potential suppliers (each, a “**Proponent**”) shall comply with these Instructions to Proponents exactly as they are set out in this RFP. Failure to do so may be grounds for disqualification of a Proposal.
- (c) Should Company decide to proceed:
 - i. if a successful Proponent(s) (each, a “**Supplier**”) has a valid pre-existing master agreement with Company that, in Company’s discretion, covers the scope of the RFP Subject (“**Existing Agreement**”), then Company and Supplier shall execute a contract supplement per the terms of the Existing Agreement for the RFP Subject (“**Contract Supplement**”). No Proponent exceptions to the terms of the Existing Agreement will be accepted; or
 - ii. if Supplier does not have an Existing Agreement, then Supplier shall enter into a contract (“**Definitive Contract**”) with Company for the purposes of supplying the RFP Subject; the Definitive Contract will be Company’s form of contract (“**Contract**”) attached at Appendix E.
- (d) Where marked as applicable in the RFP Data Sheet, Proponents are to follow instructions in the Confirmation of Receipt section of the RFP Data Sheet.

2. RFP DATA SHEET

Proponents are to refer to the RFP Data Sheet for specific information and requirements applicable to this RFP.

3. RFP DOCUMENTS

The RFP documents (“**RFP Documents**”) shall be read as a whole and comprise of:

- (a) these Instructions to Proponents;
- (b) the RFP Data Sheet;
- (c) all Appendices to the RFP listed in the RFP Data Sheet; and
- (d) any Addenda issued pursuant to this RFP.

If there are any inconsistencies among the RFP Documents, the inconsistencies will be resolved by reference to the following descending order of priority: (i) any Addenda; (ii) these Instructions to Proponents; (iii) the RFP Data Sheet; and (iv) all Appendices to the RFP.

4. RFP PROCESS

THIS RFP IS GOVERNED BY THE TERMS AND CONDITIONS SET OUT IN THIS RFP.

THIS RFP DOCUMENT IS NOT INTENDED TO BE A CALL FOR TENDERS. If this RFP is being distributed via an RFP posting on a procurement portal ("**RFP Posting**"), Proponent acknowledges that, notwithstanding the use of words such as "bid" or "tender" within such procurement portal, this process is a Request for Proposal.

5. COMPANY POLICIES

Supplier will perform the RFP Subject in accordance with Company's policies and documentation as directed by Company. Applicable Company policies are identified on the RFP Data Sheet.

6. CONFIDENTIALITY OF INFORMATION

If Proponent has an Existing Agreement, then Proponent agrees that it will treat the Confidential Information (defined below) as Company's "Confidential Information" under, and in accordance with, the Existing Agreement.

If Proponent does not have an Existing Agreement, then Proponent acknowledges that this RFP and associated information or data whether oral or written (including any subsequently delivered information relating to or supplementing this RFP) constitute proprietary and confidential information of Company ("**Confidential Information**"). Proponent agrees that it will treat all Confidential Information in strict confidence for the sole purpose of reviewing and responding to this RFP and in accordance with the terms and conditions set forth below:

- (a) Proponent will limit access to Confidential Information to only those employees of Proponent or third parties that have a need to know such Confidential Information for the purpose of Proponent preparing its Proposal.
- (b) If Proponent elects not to submit a Proposal in response to this RFP, or if Proponent is notified that it is removed from consideration, then Proponent will immediately destroy or cause to be destroyed all Confidential Information, as well as Proponent's notes, memoranda, summaries or other writings relating to any Confidential Information. If requested by Company, Proponent will provide Company with an officer's certificate certifying that all such Confidential Information and other information has been physically destroyed (i.e. deleted and shredded but not merely discarded).

Proponents acknowledge and agree that a breach of the provisions of this Section 6 would cause Company and/or its related entities to suffer a loss which could not be adequately compensated by damages, and that Company and/or any related entity may, in addition

to any other remedy or relief, enforce any of the provisions of this Section 6 upon application to a court of competent jurisdiction without proof of actual damage to Company or any related entity. The provisions of this Section 6 shall be binding and shall survive any cancellation of this RFP and the conclusion of the RFP process.

Each Proponent agrees that Company may, in Company's sole discretion, share Proposals, information and documentation arising out of this RFP with Company's affiliates.

7. PROPONENTS

- (a) Only those Proponents that have been invited to this RFP shall be eligible to submit a Proposal. Proposals from affiliates of the invited Proponents or other parties associated with the invited Proponents may not be considered without prior written approval from Company.
- (b) Unless otherwise approved in writing by Company, a Proposal must be submitted by a single Proponent.
- (c) Proponents submitting a Proposal shall be actively engaged in the line of goods or services required by the RFP Subject and shall be able to refer to goods or services of a similar nature performed by them.

8. AUTHORIZATIONS

By submitting a Proposal, Proponent represents and warrants that it has or will have satisfied itself that prior to the performance of the RFP Subject, it will be able to obtain all authorizations required by the laws of the jurisdictions in which the RFP Subject will be performed.

REQUEST FOR PROPOSAL INFORMATION

9. RFP SCHEDULE

The RFP Schedule is set out in the RFP Data Sheet with all dates being approximate and subject to change at the sole discretion of Company. Company will communicate to Proponents any changes to the RFP Schedule by issuing an Addendum.

10. COMMUNICATIONS CONCERNING RFP

- (a) All communications related to this RFP shall be submitted to the RFP contact identified in the RFP Data Sheet ("**RFP Contact**") in accordance with the RFP Data Sheet. Communications directed to Company personnel other than the RFP Contact may result in disqualification of Proponent from further consideration by Company.
- (b) Proponent is required to ensure that the RFP number and RFP Title are referenced clearly in all communications to the RFP Contact.

- (c) It is Proponent's responsibility to learn all aspects of the RFP requirements. Should any details necessary for a clear and comprehensive understanding be required, it is Proponent's responsibility to obtain clarification before submitting its Proposal.
- (d) All inquiries or requests for clarifications ("**Queries**") related to this RFP must be submitted to the RFP Contact on or before the Query Deadline set out in the RFP Schedule section of the RFP Data Sheet.
- (e) In setting out the Query and providing a response, Company may at its discretion:
 - (i) answer similar questions from different Proponents only once;
 - (ii) edit the questions for purpose of clarity; and/or
 - (iii) ignore Queries which, in Company's opinion, are obscure, ambiguous, unclear or not relevant to this RFP.
- (f) Company is under no obligation whatsoever to treat any Query as confidential and at Company's discretion, any Query of, and Company's response to, one Proponent may be provided to all Proponents.

11. REVISIONS AND CLARIFICATIONS TO RFP

- (a) All clarifications, revisions, interpretations and any supplemental instructions provided by Company will be in the form of written Addenda issued in accordance with the RFP Data Sheet. Any statement, consent, waiver, acceptance, approval, response to Query, clarification, information or anything else said or done by Company, the RFP Contact or any other person is not binding on Company and shall not and will not be relied upon by any Proponent except and only to the extent that a confirming Addendum is issued by Company, provided that Company shall not be under any obligation whatsoever to issue any Addendum.
- (b) All Proponents will be deemed to have read and reviewed all of the Addenda. Failure to comply with clarifications, changes, interpretations or supplementary instructions set out in the Addenda may result in disqualification of a Proponent's Proposal.
- (c) All requests for clarification must be made by Proponent in accordance with Section 10 above.

12. RFP REQUIREMENTS, ERRORS, OMISSIONS AND UNCERTAINTY

Proponent is solely responsible for all errors and omissions in its Proposal. It is the responsibility of Proponent to ensure that its Proposal is submitted strictly in accordance with this RFP. It is also Proponent's responsibility to comprehend and respond to all aspects of the RFP requirements. Should any details necessary for a clear and comprehensive understanding be required by Proponent, it is Proponent's responsibility to obtain clarification in accordance with Section 10 before the Query Deadline set out in the RFP Schedule section of the RFP Data Sheet. Proponent will notify the RFP Contact of any apparent errors, deviations, omissions, or conflicts noted in this RFP. Company shall not be responsible in any way whatsoever for any misunderstanding by Proponent of the RFP Documents, responses to Queries, any documents provided by Company or any other type of information provided by or communication made by Company in connection with this RFP.

13. CONFLICT OF INTEREST DISCLOSURE

Each Proponent must declare whether it has an actual or potential Conflict of Interest (as defined below). At the discretion of Company, if Proponent is found to be in a Conflict of Interest that it has not disclosed or that cannot be addressed or rectified by Proponent to the satisfaction of Company, Company may disqualify Proponent from the RFP process and any Proposal submitted by Proponent.

“**Conflict of Interest**” includes, but is not limited to, any situation or circumstance where:

- (a) in relation to the RFP process, Proponent has an unfair advantage or engages in conduct, directly or indirectly, that may give it an unfair advantage, including but not limited to: (i) having or having access to information in the preparation of its Proposal that is confidential to Company or any entity related to Company and not available to other Proponents; (ii) communicating or engaging with any person with a view to influencing preferred treatment in the RFP process; or (iii) engaging in conduct that compromises or could be seen to compromise the integrity of the open and competitive RFP process and render that process non-competitive and unfair; or
- (b) in relation to the performance of its contractual obligations, Proponent’s other commitments, relationships or financial interests (i) could or could be seen to exercise an improper influence over the objective, unbiased and impartial exercise of its independent judgment; or (ii) could or could be seen to compromise, impair or be incompatible with the effective performance of its contractual obligations.

14. OWNERSHIP OF RFP DOCUMENTS

All materials submitted by Proponents in response to this RFP shall become the property of Company without payment or liability for payment by Company and shall not be returned. Company reserves the right to, in its discretion, make a reasonable number of copies of Proposals, and utilize information and concepts contained in Proposals except to the extent such information and concepts are protected by copyright, patent or industrial design protection.

15. NO RELIANCE BY PROPONENT

Company will not be responsible for any claim, action, loss, damage, or liability arising from Proponent’s reliance or use of this RFP or any other technical or historical appendices, data, materials, photographs, or documents provided by Company. Proponent is fully responsible for obtaining all information required for the preparation of its Proposal and for the execution of the Definitive Contract or Contract Supplement, as applicable.

16. RESERVATION OF RIGHTS

- (a) Company has the right, at its discretion, without incurring any liability or obligation for claims, actions, costs, expenses, damages, penalties or losses incurred by any Proponent or any person or entity related or otherwise connected with it or its Proposal (“**Liability**”), to:

- i. change the dates, schedule, deadlines, process and requirements set out in the RFP Documents;
 - ii. accept any Proposal in whole or in part;
 - iii. reject any or all Proposals;
 - iv. change the RFP process or any of the RFP Documents;
 - v. change the limits or scope of the procurement;
 - vi. negotiate with one, some or all Proponents;
 - vii. not accept the lowest price Proposal;
 - viii. reissue the same RFP or a different request for proposal in relation to the RFP Subject;
 - ix. cancel this RFP, or the procurement of the RFP Subject, for any reason whatsoever, at any time;
 - x. accept any future proposal or other offer;
 - xi. waive any irregularity or non-compliance with the requirements of this RFP where the irregularity or non-compliance is determined by Company, in its discretion, to be minor or inconsequential; and
 - xii. if only one Proposal is received, elect to accept or reject it or enter into negotiations with Proponent.
- (b) Company may independently verify any information in any Proposal. Company also has the right to disqualify any Proponent and reject the Proposal of any Proponent which, whether intentional or not, has failed to disclose any information that would, if disclosed, materially adversely affect Company's evaluation of the relevant Proponent's Proposal.
- (c) Company may, in its discretion, without Liability at any time, reject any Proposal or disqualify a Proponent if, in the discretion of Company, such Proposal contains materially false, incorrect, or misleading information or reveals a Conflict of Interest that Company is not prepared to waive in its discretion.
- (d) If Company is of the opinion that a Proposal materially deviates from the requirements set out in the RFP Documents, Company may in its discretion and without Liability reject the Proposal. Proponent's submission of a complete but poor quality Proposal shall not be considered a failure to comply with the requirements set out in the RFP Documents but may adversely affect the evaluation and scoring of Proponent's Proposal.
- (e) Company shall not be obligated to accept Proposals that are unsigned, incomplete, conditional, illegible, obscure or contain irregularities of any kind.

- (f) Company shall have no Liability to any Proponent or any other person or entity (including, without limitation, direct ,indirect, special or punitive damages) arising directly or indirectly out of or otherwise relating to this RFP or the RFP process, including without limitation:
 - i. any Proponent's Proposal; or
 - ii. any compliant or non-compliant, qualified or unqualified submission or participation or involvement in this RFP process; or
 - iii. acts, omissions or any course of conduct by the Company, the RFP Contact or any agent or representative of Company in connection with the conduct of this RFP process.
- (g) The waiver and exclusion set out in this Section 16 applies to all possible claims, whether arising in contract, tort, equity, or otherwise, including, without limitation, any claim for breach by Company of a duty of fairness or relating to a failure by Company to comply with the rules set forth in this RFP.
- (h) Each Proponent has read, understood and agrees that this waiver and exclusion of liability is clear and unambiguous and by making its Proposal submission it agrees that it has no claim in any way connected to any of the circumstances described in this Section 16 or the RFP.
- (i) The provisions of this Section 16 shall survive any cancellation of this RFP and the conclusion of this RFP process.

17. NO IMPLIED OFFER OR BINDING COMMITMENT

No contract or other binding obligation on Company will be implied (by law or otherwise) unless and until Company and Proponent have executed the Definitive Contract or Contract Supplement, as applicable.

18. NO PUBLIC DISCLOSURE

Proponent agrees not to refer to Company in relation to this RFP or any related activities in any public disclosure without prior written approval from Company.

19. INCURRED COSTS AND EXPENSES

Proponent participates in this RFP process at its sole risk, cost and expense; Proponent is solely responsible for all costs and expenses of preparing and submitting its Proposal and any activity associated with the RFP.

20. GOVERNING LAW

This RFP will be governed by the applicable local, state and provincial laws in which the head office of Company is located and the federal laws applicable therein.

21. RFP INTERPRETATION

Company shall be the interpreter of the RFP. Proponent shall be bound by the decision of Company. All references in this RFP to Company's "discretion" or "sole discretion" means in the sole and absolute discretion of Company.

22. PROPONENT CONDUCT

- (a) Company may preclude any Proponent from proceeding with this RFP if it is found that gratuities in the form of entertainment, gifts or otherwise were offered or given by Proponent, or any employee, agent or representative of Proponent, to any officer, director, agent, or employee of Company (including the RFP Contact) or their consultants or agents, for the purpose of securing an award of the Definitive Contract or Contract Supplement, as applicable.
- (b) No Proponent may discuss or communicate with any other Proponent about the preparation of its Proposal or the Proposal of any other Proponent. Proponents shall prepare and submit Proposals independently and without any connection, knowledge, comparison of information or arrangement, direct or indirect, with any other Proponent.
- (c) Company has the right, in its discretion, to disqualify any Proponent and/or reject any Proposal where it is of the opinion that such Proponent has taken part in collusive or fraudulent behaviour.
- (d) If, on or after the Proposal Submission Deadline and prior to executing the Definitive Contract or Contract Supplement, as applicable, there is a change in circumstances that may materially adversely affect Proponent in a way which could impair Proponent's ability to perform its obligations under either or both this RFP or the Definitive Contract or Contract Supplement, as applicable, then Proponent shall promptly notify Company in writing by email to the RFP Contact. In such an event, Company may, in its discretion, disqualify Proponent from continuing in the RFP process and elect not to consider any Proposal that it submitted.

PROPOSAL SUBMISSION

23. PROPOSAL TIMING AND RECEIPT

- (a) See Appendix A for the Proposal Format and Contents, which sets out the format and content requirements.
- (b) Proposals must be received (i) no later than the date and time identified in the RFP Schedule section of the RFP Data Sheet ("**Proposal Submission Deadline**"); and (ii) by the method identified in the Proposal Submission section of the RFP Data Sheet.
- (c) All Proponents must submit their Proposals in accordance with the RFP Data Sheet.
- (d) Proposals submitted in alternative methods or formats may be disqualified.

- (e) Company is not responsible for any loss or delay with respect to the submission of any Proponent's Proposal.

24. PRE-PROPOSAL MEETINGS AND SITE VISITS

- (a) The RFP Schedule section of the RFP Data Sheet will specify whether a site visit ("**Site Visit**") and/or a pre-proposal meeting ("**Pre-Proposal Meeting**") are mandatory for all Proponents. Where such meetings or site visits are mandatory, the failure of Proponent to attend the mandatory Site Visit and/or Pre-Proposal Meeting may disqualify that Proponent's Proposal from consideration.
- (b) The details, including location and time, of the Site Visit and the Pre-Proposal Meeting shall be specified in the RFP Data Sheet.
- (c) Confirmation of attendance must be provided by Proponents to the RFP Contact by email (identified in the RFP Data Sheet) on or before the date and time set out in the RFP Data Sheet.
- (d) Where multiple Pre-Proposal Meetings and Site Visits are being conducted Proponents will identify the specific meetings and Site Visits they intend to attend in their confirmation of attendance.

25. INSPECTION OF SITES

Where applicable, Proponent shall carefully examine the work location(s) before submitting a Proposal. If a Site Visit is not identified in the RFP Data Sheet, Proponent will not be allowed access to the work location(s) without the approval of Company and compliance with Company's site requirements. Any requests for such site visits must be communicated by Proponent to the RFP Contact.

26. PROPOSAL VALIDITY PERIOD

Where specified as applicable under the RFP Data Sheet:

- (a) Proposals submitted by the Proposal Submission Date (and not withdrawn under Section 27) shall be irrevocable and remain in effect for acceptance in accordance with this Section 26, through the period of time ("**Proposal Validity Period**") as set out in the RFP Data Sheet.
- (b) The Proposal Validity Period for any Proponent(s) that has been identified as a Supplier shall automatically extend until the execution of the Definitive Contract or Contract Supplement, as applicable. Once the Supplier has executed the Definitive Contract or Contract Supplement (as applicable), the Proposal Validity Period for all Proposals shall terminate.

27. AMENDMENTS AND WITHDRAWAL OF PROPOSALS

- (a) Proponent may only amend its Proposal after submission by submitting a revised Proposal before the Proposal Submission Deadline.

- (b) Proponent may withdraw its Proposal only by giving notice in accordance with the RFP Data Sheet.

28. MODIFICATION OF PROPOSAL FORMS

Other than data input, modifications or alterations of any kind to Proposal forms supplied by Company are not permitted. Modification or alteration of Proposal forms may result in a Proposal being deemed as non-compliant.

29. PROPOSAL EXECUTION

The Proposal Submission Acknowledgement Form identified in the RFP Data Sheet shall be executed by a person with the authority to bind Proponent.

30. POST PROPOSAL INFORMATION REQUIREMENTS

Company may request additional information about a Proposal by sending a written inquiry to Proponent. Company may require a visit to Proponents/Respondents site (at Company's expense) to evaluate Proponent's operation and clarify issues of methodology and experience.

EVALUATION AND SELECTION

31. EVALUATION AND SELECTION

- (a) Proposals submitted in response to this RFP may be accepted without further negotiation by Company and are binding upon the selected Proponent(s). Company will evaluate all Proposals considering Proponents' respective abilities to meet each of the requirements as defined herein.
- (b) Proposals will be used as the basis of the evaluation. Company shall have sole discretion in its evaluation of Proposals received.
- (c) Proposals will be evaluated based upon criteria determined by Company, in its sole discretion. Such criteria (in no particular order) shall include, but not be limited to, those criteria set out in the RFP Data Sheet.
- (d) A short list of Proponents may be established upon completion of an initial round of evaluations.
- (e) Proponent may be requested to make a presentation regarding its Proposal to Company. Proponent's key management and technical people are expected to participate in any presentations that occur.
- (f) Company reserves the right to review Proposal submitted by Proponent, and then to enter into simultaneous negotiations with all or any other Proponents for purposes of refining the scope of the RFP Subject or finalizing the terms of the Definitive Contract or Contract Supplement, as applicable.

- (g) Proponents will be notified whether they have been selected as a Supplier. Company will not be obligated to provide reasons for acceptance or rejection of any Proposal.

RFP SECTION REFERENCE AND DESCRIPTION	ITEM
	Appendix F: Other Documents <ul style="list-style-type: none">• Intent to Respond Form• Scope of Services

Proposals are to follow the outline described below and must address all requested information. Any additional information that Proponent wishes to include that is not specially requested should be included under Part 2 to the Proposal. Proponents are encouraged to keep their Proposal brief and to the point, but sufficiently detailed to allow evaluation of the approach to the RFP Subject.

Proponent is to provide each of the Parts as a separate document or package of documents. No pricing is to appear in the Technical Response.

In the event that Proponents are requested in the RFP to submit more than one Proposal, Proponent shall create a distinct folder for each Proposal clearly labelled as Submission #1 (Required), Submission #2 (Alternate), etc. Proponents shall place the folders in the corresponding Parts of the Proposal in accordance with the submission requirements set out below.

The Proposal format and content must consist of the following outline:

Part 1: Proposal Submission Acknowledgement Form

Proponent shall sign and date to the Proposal Submission Acknowledgement form included under Appendix B. The form must be signed by the person(s) who are authorized to sign and contractually bind Proponent. This document is to be submitted as one file in PDF format.

Part 2: Technical Response

Proponent shall complete the Technical Response by submitting its responses to the information requested under the Technical Requirements Document included under Appendix C. The responses shall be in the format(s) as specified in Appendix C.

Part 3: Commercial Response

Proponent shall complete the Commercial Response by submitting its responses to the information requested under the Commercial Requirements Document included under Appendix D. The responses shall be in the format(s) as specified in Appendix D.

Proposal Submission

In consideration of Company’s evaluation of our Proposal in accordance with the RFP Documents and for other good and valuable consideration, the receipt and sufficiency of which is hereby acknowledged, the undersigned Proponent hereby acknowledges and agrees to be bound by and comply with the terms and conditions of the RFP. Proponent hereby represents and warrants to Company that it has carefully and thoroughly examined the RFP Documents in detail, has received all pages of the documents constituting the RFP Documents (including all Addenda issued by Company), and has the resources, skills, capacity and ability to perform the services/provide the goods, as applicable in accordance with the RFP Documents. Unless otherwise defined in this Proposal Submission Acknowledgement, all capitalized terms have the applicable meanings given in the RFP.

Receipt of Addenda

Proponent hereby acknowledges the receipt of the following addenda:

Addendum Date	Addendum Number	Addendum Date	Addendum Number

Name (Print)

Title

[Please see attached.]

Attached please find the following documents:

Attachment	Document
1	Intent to Respond Form
2	Scope of Services

Please check the appropriate box (see below) and **email** this acknowledgment form to the RFP Contact set out in the RFP Data Sheet on or before the Deadline for Intent to Respond Form set out in the RFP Data Sheet.

Intend to Submit a Proposal

We hereby acknowledge receipt of the above referenced RFP. We have reviewed the RFP Documents and advise that we intend to submit a Proposal **on or before the Proposal Submission Deadline**.

Do Not Intend to Submit a Proposal

We hereby acknowledge receipt of the above referenced RFP. We have reviewed the RFP Documents and advise that we do not intend to submit a Proposal. We will return or destroy all RFP Documents on or before the Query Deadline in accordance with the confidentiality provisions set out in the Instructions to Proponents.

Scope of Services:

1. Determine methodologies for depreciation and the estimation of net salvage, including:
 - a. Performing research to identify applicable methodologies
 - b. Assessing the methodologies identified with consideration to a base case and alternative scenarios including energy transition
 - c. Recommending appropriate methodologies
2. Perform a service life study which will include the following tasks:
 - a. A full review of plant accounting data and plant balances as of EGI's 2020 fiscal year-end
 - b. Inclusion of the forecast 2022-2023 capital program related to capital additions and retirements into the databases used for the review of average service life and depreciation rate calculations
 - c. A physical field review of facilities (if necessary)
 - d. Interviews with EGI management and internal subject matter experts
 - e. Development of a detailed peer comparison analysis
3. Determine the adequacy of the current accumulated depreciation accounts to reflect the consumption of the consumed service value of the EGI plant in service
4. Determine the appropriate net salvage percentages and assess the adequacy of the current balance of net salvage recoveries
5. Determine appropriate discount rates to be used in analyses and perform sensitivity analysis as required
6. Deliver a full and comprehensive draft report by November 30th, 2021; management meetings to discuss the depreciation policies and results of the depreciation study
7. Review the actual 2021 plant accounting activity immediately following the close of the 2021 financial ledgers to determine if any changes are required to the draft depreciation study report
8. Deliver a final report, in format suitable to be presented as evidence before the OEB by February 11, 2022

Deliverables:

A written report that provides descriptions and outcomes of the analyses of depreciation and net salvage estimation methods under various scenarios, service lives, net salvage values, and summaries and detailed tabulations of annual and accrued depreciation. The consultant may need to participate in the OEB proceeding as an expert witness – either through written submissions or in person.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Canadian Manufacturers & Exporters (CME)

Interrogatory

Reference:

Exhibit 4, Tab 5, Schedule 1, Attachment 3, p. 18 of 20

Question(s):

At page 18, EGI listed what it believes are the benefits and drawbacks of establishing a segregated fund.

- a) Please provide a forecast for what EGI believes the administration costs would be for administering a segregated fund.
- b) Please provide a forecast for what EGI believes the legal and tax involvement costs would be to deal with 'tax issues associated with establishing the fund'.
- c) Please explain why EGI believes the fact that no utility has voluntarily set up a segregated fund for SRC costs is, in and of itself, a drawback.
- d) Please explain why EGI believes that not having a large-scale retirement is in and of itself, a drawback to setting up a segregated fund.
- e) Has EGI forecast what positive returns it may earn on a segregated fund that was invested. Alternatively, is EGI aware of what other entities have earned from investing segregated funds?

Response:

- a) Enbridge Gas has not forecasted the administration costs for administering a segregated fund. Please see response at Exhibit I.4.5-ED-136 part h) for administration costs that some CER regulated entities have reported on their segregated funds.
- b) Enbridge Gas has not forecasted the legal and tax costs associated with establishing the fund, however, this would include costs related to engaging legal counsel to set

up the trust, tax lawyers to petition the Canada Revenue Agency (CRA) for the setup of a Qualifying Environmental Trust (QET) and costs related to filing tax returns.

- c) Enbridge Gas believes that the lack of precedent regarding natural gas utilities and segregated funds is potentially a drawback as this is indicative of the practicality of these funds for natural gas utilities and their numerous and diverse assets. The Company found that many of the conclusions for not adopting a segregated fund as described by Fortis BC in their 2012-2013 Revenue Requirements and Natural Gas Application were applicable to Enbridge Gas today.
- d) Enbridge Gas does not believe that not having a large-scale retirement is necessarily in itself, a drawback. Rather, Enbridge Gas does not expect to require funds to retire a significant portion of the utility assets in the near to medium term. The company believes it would be more appropriate to set up a segregated fund when there is more certainty regarding the expected end of life of its assets and suggests that certain 'sign posts', as provided at Exhibit I.4.5-SEC-193 part b) could be used to initiate the establishment of a segregated fund..
- e) Enbridge Gas has not forecasted any potential return scenarios for a segregated fund. Please see response at Exhibit I.4.5-ED-136 part g) for returns that some CER regulated entities have reported on their segregated funds.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 4, Tab 5, Schedule 1 (Depreciation)

Question(s):

- a) Enbridge states on page 17 that “CER-regulated pipelines have an expected end of life whereas [Enbridge’s] assets are expected to be replaced over time and remain useful.” For each of the following CER-regulated methane gas pipelines, please indicate which ones are and are not expected to be replaced over time and remain useful:
- i. Alliance
 - ii. Emera Brunswick
 - iii. Foothills
 - iv. Many Islands
 - v. Maritimes & Northeast
 - vi. NOVA Gas Transmission Ltd. (NGTL)
 - vii. TransCanada’s Canadian Mainline
 - viii. Trans Québec & Maritimes
 - ix. Vector
 - x. Westcoast
- b) Please confirm which CER-regulated pipelines are required to pay future abandonment funds into a segregated fund.
- c) Has Enbridge assess the probability that a significant portion of its pipelines will not be replaced or remain useful post-2050? If yes, please indicate the possibility or range of possibilities.
- d) If Enbridge’s application is approved as filed, how much of existing rate base plus rate base added between now and 2028 would remain undepreciated by 2050?
- e) If Enbridge’s application is approved as filed, by what date would the assets to be built between now and 2028 be depreciated?

- f) Please provide a complete description of how the CER abandonment fund is designed and structured, with a link to the relevant CER rulings, rules, and guidelines.

Response:

- a) Enbridge Gas would like to clarify the intent of the statement on Exhibit 4, Tab 5, Schedule 1, page 17. It is the Company's understanding that the intent of the segregated funds for CER-regulated pipeline assets is to accumulate funds for abandonment (i.e. terminal retirement of assets) and the expectation is that funds are not withdrawn in the interim. The statement is not meant to infer that the pipelines listed would not be repaired or replaced over time. Enbridge Gas is not able to comment on the specific maintenance and replacement strategies of other companies.
- b) Based on reports available on the CER website¹, Enbridge Gas understands that there are over 30 CER-regulated companies using segregated funds for abandonment trusts.
- c) Enbridge Gas has not assessed the probability that a significant portion of its pipelines will not be replaced or remain useful post 2050, as there still exists a great deal of uncertainty around how the energy transition could unfold within Ontario; see response at Exhibit I.2.6-STAFF-70 part b) for additional discussion on this topic. Enbridge Gas did complete an Energy Transition Scenario Analysis (ETSA), however, and a description of this work is provided at Exhibit 1, Tab 10, Schedule 5, pages 3 to 6. The ETSA examined four different scenarios, including an electricity centric scenario that has a limited role for low-carbon gases. As noted above, Enbridge Gas did not assess the probability of this, or of any of the other three scenarios, coming to fruition in Ontario.
- d) Assuming the forecasted rate base as at the end of December 31, 2026 and assuming the assets are fully intact without any damages and replacements, the estimated undepreciated amount of rate base remaining in 2050 is \$1.4 billion. Enbridge Gas is unable to provide the estimate including rate base additions from 2027 to 2028 due to the forecasting horizon used for planning purposes. The forecasts for 2025 and 2026 do not include the changes to depreciation expense reflected in the March 8, 2023 update. Please see response at Exhibit I.1.2-SEC-6.

¹ Canada Energy Regulator. Advisory. <https://apps.cer-rec.gc.ca/REGDOCS/Item/View/90463>.

- e) Assuming the Application is approved as filed and the assets as of December 31, 2026 remain fully intact without any damages and replacements, the estimated date for the assets to be depreciated is 2078. Enbridge Gas is unable to provide the estimate including rate base additions from 2027 to 2028 due to the forecasting horizon used for planning purposes. The forecasts for 2025 and 2026 do not include the changes to depreciation expense reflected in the March 8, 2023 update. Please see response at Exhibit I.1.2-SEC-6.
- f) The Set-Aside and Collection Mechanisms Reasons for Decision² discusses the directive from the CER (previously NEB) and provides guidance and direction for trust agreements including a model agreement. Please refer to the link in the footnote for more information.

² MH-001-2013, NEB Reasons for Decision, May 2014, https://docs2.cer-rec.gc.ca/ll-eng/llisapi.dll/fetch/2000/90463/782060/927998/946532/2478727/A60676-1_NEB_-_Reasons_for_Decision_-_Set-aside_and_collection_mechanism_-_MH-001-2013.pdf?nodeid=2477576&vernum=-2.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 4, Tab 5, Schedule 1 (Depreciation)

Question(s):

- a) What is the current balance of the funds that Enbridge has collected for site restoration?
- b) What is the forecast balance of the funds that Enbridge has collected for site restoration as of the end of 2028?
- c) Please provide an approximate estimate of the combined site restoration cost for all of Enbridge's pipeline assets (i.e. how much it would cost to abandon the pipes and restore the sites)? Please compare and reconcile this with Guidehouse's estimate that "Ontario's decommissioning costs could exceed \$1.0 billion per year."¹
- d) Please provide a table showing for each of the last ten years (i) what Enbridge has collected in rates for site restoration that year, (ii) what amounts have been used for site restoration that year, and (iii) the running annual balance for site restoration costs. If possible, please also forecast these figures for 2024-2028.
- e) Enbridge notes on page 18 that the "amounts collected are used to fund working capital requirements, which in turn reduces the need for financing and therefore has a favourable impact for customers in the form of lower rates, all else being equal." What is the current return (%) accruing to ratepayers on the funds Enbridge holds for future abandonment costs?
- f) Please provide a table showing for each of the last ten years what ratepayers have saved on account of site restoration costs being used to fund working capital, which in turn reduces the need for financing.
- g) What was the average return earned on the site restoration costs held in a segregated fund for CER-regulated pipelines for each for the last five years? If the

¹ Exhibit 1, Tab 10, Schedule 5, Attachment 2, p.45.

return differs by pipeline or company, please provide some examples (e.g. for Enbridge-owned pipelines).

- h) Enbridge notes on page 19 that there would be “[a]dministrative costs required to set up, monitor and maintain the fund.” What were the administrative costs as a percent of the total invested amount for site restoration costs held in a segregated fund for CER-regulated pipelines for each for the last five years? If the figure differs by pipeline or company, please provide some examples (e.g. for Enbridge-owned pipelines).
- i) Enbridge notes on page 19 that “tax issues associated with establishing a fund are complex and would require significant legal and tax involvement to resolve.” How are those tax issues addressed for pipelines under the CER segregated abandonment fund model?

Response:

- a) The current balance of future removal and site restoration reserves is \$1,615 million as of December 31, 2022.
- b) Enbridge Gas is unable to forecast the balance out to 2028 as this is beyond the forecasting horizon used for planning purposes. The estimated balance for 2026 is \$1,831 million.
- c) The estimated amount of future site restoration costs for all of Enbridge Gas’s assets discounted to today’s dollar equivalent is \$4.7 billion (\$21.3 billion undiscounted).

The following response was provided by Concentric Energy Advisors:

Please see response at Exhibit I.4.5-IGUA-14, Attachment 1 which provides the detailed CDNS calculations for each account. The currently estimated future cost of removal requirement is identified in the column “Future Salvage Requirement”.

It is not possible to provide the requested reconciliation. The Guidehouse report reference was to studies completed in the UK, and specific details of the UK cost estimates were not provided. The net salvage estimates presented in the Concentric depreciation study were based on the data as outlined in Section 7 of the Concentric report and then adjusted using a CDNS method. These assumptions cannot be compared to the four UK studies as the specific details of the UK studies were not available.

- d) Please see response at Exhibit I.1.8-STAFF-17, parts b) and f).

- e) The current return accruing to ratepayers in the EGD rate zone is 6.20%, reflecting EGD's 2018 approved required rate of return. The establishment of 2018 rates was the last time the required rate of return was updated for the EGD rate zone. The current return accruing to ratepayers in the Union rate zones is 7.30%, reflecting Union's 2013 approved required rate of return. The establishment of 2013 rates was the last time the required rate of return was updated for the Union rate zones. The noted returns do not factor in any impact of price cap escalation that has occurred since the rates were approved
- f) Please refer to Attachment 1 for a summary of the approximate revenue requirement reductions (or savings) attributable to site restoration cost collections (eg. the outstanding liability) which are credited to rate base, thereby reducing associated carrying costs. As identified in Attachment 1, the approximate total savings over the 10-year period 2013 to 2022 for the EGD and Union rate zones are \$540 million and \$489 million, respectively.

The savings to ratepayers reflect what is included in rates. As such, the benefit to EGD rate zone ratepayers changed in each of 2013 through 2018, as rate base and the required rate of return were updated for rate setting purposes in each of those years. However, since the start of the current price cap term, the 2018 value has carried on, ignoring any potential impact of price cap escalation that has occurred. The Company notes that in order to calculate the approximate savings for the EGD rate zone, it has utilized the actual average site restoration cost liability outstanding in each of 2013 to 2018 years as a proxy for what would have been reflected in the approved accumulated depreciation included in rate base. The site restoration cost liability that was inherent within the approved forecast of accumulated depreciation in each of those years was not separately identified.

The benefit to Union rate zones ratepayers has remained constant at the 2013 level (again ignoring any potential price cap escalation), as rate base and the required rate of return have not been updated for rate setting purposes under Union's prior price cap mechanism, or under Enbridge Gas's current price cap mechanism. Similar to the EGD rate zone, in order to calculate the approximate savings for the Union rate zones, the Company utilized the actual average site restoration cost liability outstanding for 2013 as a proxy for what would have been reflected in the approved accumulated depreciation included in rate base.

- g) Enbridge Gas is not aware of the average return earned over the last five years for all CER regulated pipelines. For the 28, 2021 Abandonment Funding Trust Reports that Enbridge Gas has found on the CER web site, the reported earnings within the trust have been negative for over 60% of the trusts reporting and, in aggregate, the reported earnings have been approximately 2.4% of the closing aggregate balance of the trust funds.

Table 1 provides a summary of fund performance for the four largest segregated funds by Enbridge-owned companies based on data from Enbridge.com:

Table 1
Fund Performance Summary

Company	Total Return - 2021	Total Return - 2020
Enbridge Pipelines Inc.	(6.2%)	9.3%
Enbridge Pipelines NW Inc.	(2.6%)	4.8%
Enbridge Southern Lights Pipeline	(5.9%)	8.7%
Enbridge Bakken Pipeline	(5.6%)	8.2%

- h) Enbridge Gas is not aware of the administrative costs for all CER regulated pipelines over the last five years. Table 2 provides a summary of 2021 administrative costs for the four largest segregated funds by Enbridge-owned companies based on data from Enbridge.com:

Table 2
2021 Administrative Costs

Company	Net Assets 2021 (\$'000s)	Admin Costs 2021 (\$'000s)	Admin Costs as % of Net Assets
Enbridge Pipelines Inc.	349,667	267	0.08%
Enbridge Pipelines NW Inc.	19,813	25	0.13%
Enbridge Southern Lights Pipeline	31,147	33	0.11%
Enbridge Bakken Pipeline	5,232	11	0.21%

The administrative costs reported by the funds do not include the cost of internal Enbridge resources required to support the management of the fund. Activities performed by Enbridge personnel include supporting audits, preparing financial statements, tax filings and regulatory filings, managing the fund trustee relationship and managing landowner relationships. Enbridge Gas further expects that additional resources would be required to manage the administrative work of requesting withdrawals from the fund for the various asset retirements that take place each year.

- i) Enbridge Inc.'s CER-regulated pipelines established trusts to set aside funds for reclamation obligations associated with future pipeline abandonment. The trusts were approved by the CER (historically, NEB) to meet the requirements under the Land Matters Consultation Initiative (LMCI). Also, the trusts were accepted by the Canada Revenue Agency (CRA) in advance rulings as Qualifying Environmental Trust (QET), which is defined in the *Income Tax Act* (ITA) subsection 211.6(1).

Enbridge Inc., along with other pipeline industry peers, identified a QET as the best mechanism to both meet the LMCI requirements and remain tax efficient. The pipeline industry joined efforts to lobby for the inclusion of pipelines in the definition of “qualifying site”, one of the pre-requisites for a trust to be a QET. After years of effort, “qualifying site” under ITA subsection 211.6(1) was amended to include sites used for pipeline operations. “Qualifying site” now includes the following categories:

- Operation of a mine
- Extraction of clay, peat, sand, shale or aggregates (including dimension stone and gravel)
- Deposit of waste
- Operation of a pipeline

A trust established for similar set-aside reclamation fund purposes has to be for a site that can be included in one of these categories to qualify for the QET status.

Although pipelines have been included in the scope of “qualifying site”, whether a trust established by a pipeline company meets the criteria of QET status is still not straightforward due to the restrictive clauses defined in ITA subsection 211.6(1) for “excluded trust”, “prohibited investment”, “qualifying contract” and “qualifying law”.

These complicated tax rules require specialized knowledge in this area and significantly reduce the certainty about the QET status of a trust. As a result, Enbridge and its peer pipeline companies engaged external experts in preparing and submitting applications for advance income tax ruling on the QET status for each trust. No investment activities were initiated before a ruling was issued by the CRA.

Union Rate Zone Site Restoration Liability Revenue Requirement Impacts 2013-2022

Line No.	(\$000's)	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022	TOTAL
1.	Rate base (1)	(576,428.8)	(576,428.8)	(576,428.8)	(576,428.8)	(576,428.8)	(576,428.8)	(576,428.8)	(576,428.8)	(576,428.8)	(576,428.8)	
2.	Required rate of return (2)	<u>7.30%</u>										
3.	Cost of capital (3)	(42,079.3)	(42,079.3)	(42,079.3)	(42,079.3)	(42,079.3)	(42,079.3)	(42,079.3)	(42,079.3)	(42,079.3)	(42,079.3)	(420,793.0)
4.	Income taxes on earnings (net) (4)	(6,858.3)	(6,858.3)	(6,858.3)	(6,858.3)	(6,858.3)	(6,858.3)	(6,858.3)	(6,858.3)	(6,858.3)	(6,858.3)	(68,583.0)
5.	Revenue requirement (5)	<u>(48,937.6)</u>	<u>(489,376.0)</u>									

Notes:

- (1) Represents the actual 2013 average outstanding site restoration cost liability included as part of accumulated depreciation, which reduces PP&E and Rate Base
- (2) The 2013 approved required rate of return (or weighted average cost of capital)
- (3) Cost of capital savings as a result of funding a lower level of rate base
- (4) Tax gross-up of the preference share and equity financed components of rate base
- (5) Gross revenue requirement reduction associated with the site restoration cost liability reflected in rate base

EGD Rate Zone Site Restoration Liability Revenue Requirement Impacts 2013-2022

No.	(\$000's)	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022	TOTAL
1.	Rate base (1)	(881,773.5)	(861,635.6)	(797,362.3)	(730,826.5)	(659,877.9)	(635,087.4)	(635,087.4)	(635,087.4)	(635,087.4)	(635,087.4)	
2.	Required rate of return (2)	<u>6.81%</u>	<u>6.79%</u>	<u>6.52%</u>	<u>6.41%</u>	<u>6.21%</u>	<u>6.20%</u>	<u>6.20%</u>	<u>6.20%</u>	<u>6.20%</u>	<u>6.20%</u>	<u>6.20%</u>
3.	Cost of capital (3)	(60,048.8)	(58,505.1)	(51,988.0)	(46,846.0)	(40,978.4)	(39,375.4)	(39,375.4)	(39,375.4)	(39,375.4)	(39,375.4)	(455,243.3)
4.	Income taxes on earnings (net) (4)	(10,468.4)	(10,679.6)	(9,744.2)	(8,829.4)	(7,607.7)	(7,519.1)	(7,519.1)	(7,519.1)	(7,519.1)	(7,519.1)	(84,924.8)
5.	Revenue requirement (5)	<u>(70,517.2)</u>	<u>(69,184.7)</u>	<u>(61,732.2)</u>	<u>(55,675.4)</u>	<u>(48,586.1)</u>	<u>(46,894.5)</u>	<u>(46,894.5)</u>	<u>(46,894.5)</u>	<u>(46,894.5)</u>	<u>(46,894.5)</u>	<u>(540,168.1)</u>

Notes:

- (1) For each of 2013 - 2018, represents the actual average outstanding site restoration cost liability included as part of accumulated depreciation, which reduces PP&E and Rate Base. The 2018 average value is then used for each of 2019 - 2022 as there was no annual update to rate base reflected in rates.
- (2) The 2013 - 2018 approved required rates of return (or weighted average cost of capital). The 2018 approved required rate of return was carried forward for 2019 - 2022 as there was no annual update to the required return reflected in rates.
- (3) Cost of capital savings as a result of funding a lower level of rate base
- (4) Tax gross-up of the preference share and equity financed components of rate base
- (5) Gross revenue requirement reduction associated with the site restoration cost liability reflected in rate base

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 4, Tab 5, Schedule 1 (Depreciation)

Question(s):

- a) If the OEB ordered a segregated fund for site restoration costs, would Enbridge recommend that the existing balance be phased into the segregated fund over time to smooth the impact on rate base and revenue requirement? If yes, over what period would Enbridge recommend doing so?

Response:

- a) If the OEB ordered the implementation of a segregated fund, Enbridge Gas agrees that a phased-in approach would be an option to investigate. However, the Company has not contemplated any such scenarios and is unable to comment on an appropriate phase-in period at this time.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 4, Tab 5, Schedule 1 (Depreciation)

Question(s):

- a) Please provide a table showing the proposed depreciation periods for the five largest asset categories.

Response:

- a) Table 1 includes the five largest asset categories, in order of magnitude, based on average plant balances in the 2024 Test Year and the proposed depreciation periods.

Table 1
Service Lives for Major Assets

<u>Account</u>	<u>Description</u>	<u>Estimated Survivor Curve</u>
473.02	Distribution Plant - Services – Plastic	55-S3 (55 years)
475.21	Distribution Plant - Mains – Coated and Wrapped	55-R3 (55 years)
475.30	Distribution Plant - Mains - Plastic	60-R4 (60 years)
465.00	Transmission Plant - Mains	60-R4 (60 years)
478.00	Distribution Plant - Meters	15-S2.5 (15 years)

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 4, Tab 5, Schedule 1, Attachment 1 (Concentric Depreciation Study)

Question(s):

These questions are for Concentric:

- a) At page 19, Concentric notes: “Consistent with the reduction in the utilization of the assets, it could be assumed that large scale retirement of assets may be required in the periods between now and 2050.” Please discuss some possible changes to depreciation policies that could be implemented to hedge against this possibility short of implementing a 2050 economic planning horizon, such as other methods to shorten the depreciation period.
- b) At page 19, Concentric notes: “The introduction of hydrogen may have a life lengthening impact on the system if it is determined that hydrogen is a sustainable replacement fuel.” Does Concentric agree that the introduction of hydrogen could also have a shortening impact on many Enbridge assets that cannot accommodate hydrogen fuel due to its chemical properties (e.g. interactions with steel) and its propensity to leak as the smallest molecule?
- c) Has Concentric conducted a jurisdictional scan to determine whether any other gas regulators or gas utilities have adjusted their approach to depreciation to account for the possibility of gas pipelines having a shorter economic life due to decarbonization? If yes, please provide a list of the gas regulators/utilities that were and were not examined.

Response:

The following response was provided by Concentric Energy Advisors, Inc.:

- a) Concentric notes that the approval and use of the Equal Life Group (ELG) procedure in the calculation of the depreciation rates is key to minimize the risk of under recovery of the investment in property, plant and equipment. Please see

Exhibit I.4.5-STAFF-173 part c) for a more detailed discussion of the benefits of the ELG procedure.

Additionally, certain of the Enbridge Gas assets may benefit in future studies from a Unit of Production method of depreciation, particularly the gas storage facilities. A Unit of Production calculation requires that the annual throughput through the storage facilities be divided by the ultimate production capacity of the facility from the date it was first placed into service through to the end of its expected life. As such, it is not possible to utilize Unit of Production at this time due to a lack of certainty regarding total estimated production units.

- b) Concentric agrees that a number of issues remain to be explored prior to making any determination of potential life extending or shortening impact that the increased introduction of hydrogen into natural gas distribution and storage systems.
- c) Concentric has attended a number of conferences and presentations sponsored by CAMPUT, the American Gas Association, and the Society of Depreciation Professionals on the topics of energy transition and the use of alternative fuel sources. These conferences and presentations were attended by many gas and electric utilities, industry professionals and consultants and a number of Future of Energy experts. To the extent that these conferences included many panel and open forum discussions, a number of questions and issues have been discussed. It is apparent from these discussions that much research on this topic is required. As such, Concentric has not seen or developed a specific survey of all North American jurisdictions, but is aware of some activity from the above organizations to begin to develop this type of broad industry information.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 4, Tab 5, Schedule 1, Attachment 1 (Concentric Depreciation Study)

Question(s):

These questions are for Concentric:

- a) According to Enbridge's interpretation of the Concentric report, a 2050 economic planning horizon would mean that "the 2024 Test Year depreciation expense would increase by \$282 million, from \$921 million to \$1.2 billion" per Exhibit 1, Tab 10, Schedule 4, Page 18. Is that accurate? Please provide the unrounded figures.
- b) Does concentric agree that the impact on the depreciation expense would likely be even higher if a 2050 economic planning horizon were to be implemented in, say, 2030?
- c) Approximately by what percent would the depreciation expense increase if a 2050 economic planning horizon were to be implemented in (i) 2024, (ii) 2028, (iii) 2030, or (iv) 2035. Please make and state any simplifying assumptions necessary to provide an approximate answer, as well as any caveats.

Response:

- a) Please see the response at Exhibit I.4.5-LPMA-34. Note that the increase in depreciation expense has been updated to \$290.4 million, please see Exhibit I, Tab 10, Schedule 4, page 18, updated March 8, 2023.
- b) The following response has been provided by Concentric:

Concentric agrees that the impact on depreciation expense will increase in future years in the circumstances where, if required, the implementation of an economic planning horizon is delayed as noted in response to part c) of this question. A delay, if required, until 2030 will result in higher depreciation in 2030.

c) The following response has been provided by Concentric:

It is correct that delaying the implementation of an economic planning horizon will increase the impact of the economic planning horizon; however, the amount of the increase is not linear. Concentric has modelled the depreciation calculations using an economic planning horizon and the CDNS net salvage method as requested. It should be noted that in order to run the calculations accurately, the following simplifying assumptions were made:

- Ongoing capital additions were forecast to be one percent of plant in service every year. This is to account for additions due to required maintenance and replacements.
- Forecasted retirements were not included in the original cost balances.
- Booked accumulated depreciation was calculated as the 2021 booked accumulated depreciation, plus the annual accrual amount for each year as calculated in the current depreciation study for the period of 2021 to 2024. New annual accrual amounts were calculated at 2024, 2028, 2030, and 2035 (see Table 1) and calculations assumed there was not an approved economic planning horizon at the time of the update and the same average service life, lowa curve dispersion and underlying net salvage estimates with the CDNS methodology applied.
- The change in depreciation rate was not calculated on general plant accounts in order to avoid the short-lived nature of these accounts from impacting the calculations. The percentage of the investment in general plant that is influenced by the economic planning horizon is minor due to the short average service life estimates. As such, excluding these accounts prevents the depreciation calculations from overreacting to forward test years.

Table 1

Year	Composite Depreciation Rate
2024	4.32%
2028	4.46%
2030	4.61%
2035	5.43%

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 4, Tab 5, Schedule 1, Attachment 1 (Concentric Depreciation Study)

Question(s):

This question is for Concentric:

- a) Approximately by what percent would the depreciation expense increase in 2024 if an adjustment was made to reduce the depreciation period for Enbridge's pipelines by (i) 25% or (ii) 50% to account for the possibility that early retirement may be necessary due to decarbonization-driven electrification or

Response:

The following response was prepared by Concentric Energy Advisors, Inc.:

- a) Please see response at Exhibit I.4.5-ED-140 for the impact of shortening economic planning horizons on the total depreciation expense. The depreciation impact of shortening the economic planning horizon by 25 or 50 percent would be similar to that of calculating the theoretical depreciation expense at a time in the future. Concentric estimates that the impact of a 20-year planning horizon instituted in 2024 would be slightly lower than the impact seen in the 2030 depreciation calculations completed for response Exhibit I.4.5-ED-140 due to the reduced amount interim additions in the system between 2024 and 2030.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Exhibit 4, Tab 5, Schedule 1, Attachment 1 (Concentric Depreciation Study)

Question(s):

These questions are for Concentric:

- a) On page 438, Mr. Kennedy's CV includes the following: "Midwestern Gas Transmission Company: The assignment included development of a detailed depreciation study and Testimony to develop the appropriate depreciation policy to align with the organization's overall goals and objectives. The resulting depreciation study, which was submitted to the Federal Energy and Regulatory Commission, incorporated the concepts of time-based depreciation for gas transmission accounts and development of Economic Planning Horizons. The Direct Testimony included significant discussion related to the topics of Decarbonization and changing political climate towards removal of fossil fuel demand forecasts. (emphasis added)" Please provide a copy (or link) of the depreciation study and testimony.
- b) On page 438, Mr. Kennedy's CV includes the following: "Enbridge Lakehead System: A Technical Update to a 2016 full depreciation study was prepared and filed with the FERC in 2021 in support of updating depreciation rate and resultant depreciation expense. The technical update also included an analysis and recommendation of a 20-year Economic Planning Horizon (Economic Life). (emphasis added)" Please provide a copy (or link) to the technical update relating to an Economic Planning Horizon.
- c) On page 439, Mr. Kennedy's CV includes the following "Alliance Pipeline L.P. A number of depreciation studies have been completed by Mr. Kennedy for both the Canadian and US assets of Alliance Pipelines. The most recent studies completed in 2012 for Submission to the National Energy Board of Canada and to the Federal Energy Regulatory included operational discussions related to the gas transmission plant, the service life analysis for all accounts using the retirement rate analysis, discussion with management regarding outlook, and the inclusion of an Economic Planning Horizon." Please provide a copy or link to this.

Response:

The following response was prepared by Concentric:

- a) Please see Attachment 1 and Attachment 2.
- b) Please see Attachment 3.
- c) Please see Attachment 4 for FERC filing and Attachment 5 for CER/NEB filing.

Exhibit No. MGT-0015

**Prepared Direct Testimony of
Larry E. Kennedy**

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

MIDWESTERN GAS TRANSMISSION COMPANY

Docket No. RP21-___-000

PREPARED DIRECT TESTIMONY OF

LARRY E. KENNEDY

1 **Q. Please state your name and business address.**

2 A. My name is Larry E Kennedy. My business address is 200 Rivercrest Drive SE, Suite
3 277, Calgary, Alberta, T2C 2X5.

4 **Q. By whom are you employed?**

5 A. I am employed by Concentric Energy Advisors., Inc. (“Concentric”).

6 **Q. What is your position with Concentric?**

7 A. I am employed by Concentric as a Senior Vice President.

8 **Q. On whose behalf are you submitting this Direct Testimony?**

9 A. I am submitting this Direct Testimony before the Federal Energy Regulatory
10 Commission (“FERC”) on behalf of Midwestern Gas Transmission Company (“MGT” or
11 the “Company”).

12 **Q. Please describe your education and experience.**

13 A. I am a Certified Depreciation Professional, with over 40 years of regulatory plant
14 accounting and depreciation experience, and over 20 years of depreciation and plant
15 accounting consulting to the regulated utility and pipeline industry. I have advised
16 numerous energy and utility clients on a wide range of accounting, property tax and utility
17 depreciation matters. Many of these assignments have included the determination of
18 appropriate annual depreciation accrual rates. I have included my resume and a summary
19 of testimony that I have filed in other proceedings as Schedule 1 to this testimony.

20 **Q. Please describe Concentric’s activities in energy and utility engagements.**

21 A. Concentric provides financial and economic advisory services to many and various
22 energy and utility clients across North America. Our regulatory, economic, and market
23 analysis services include utility ratemaking and regulatory advisory services; energy
24 market assessments; market entry and exit analysis; corporate and business unit strategy
25 development; demand forecasting; resource planning; and energy contract negotiations.
26 Our financial advisory activities include buy-and-sell-side merger, acquisition, and

1 divestiture assignments; due diligence and valuation assignments; project and corporate
2 finance services; and transaction support services. In addition, we provide litigation
3 support services on a wide range of financial and economic issues on behalf of clients
4 throughout North America.

5 **Q. Have you testified before any regulatory authorities?**

6 A. Yes. A list of proceedings in which I have provided testimony is provided in Schedule
7 1 to this testimony.

8 **I. PURPOSE AND OVERVIEW**

9 **Q. What is the purpose of your Direct Testimony?**

10 A. My Direct Testimony presents the results of my comprehensive depreciation study of
11 the plant in service of the MGT system as of October 31, 2020. My detailed report,
12 including my analyses and recommendations, is provided in Exhibit No. MGT-0016, titled
13 “Calculated Annual Depreciation Rates Applicable to Plant in Service as of October 31,
14 2020.” I prepared or directed the preparation of all aspects of the depreciation study
15 described in the report.

16 **Q. Please provide a brief overview of the analyses that led to your recommended
17 depreciation rates for MGT.**

18 A. In preparing the depreciation study, I analyzed the historic plant account data of
19 MGT to prepare an analysis of the Company’s past retirement experience. I met with the
20 Company’s management and operations representatives to determine the extent to which
21 the historic data would be reflective of the future retirement patterns. Lastly, I also
22 reviewed the average service life and net negative salvage indications of many North
23 American transmission pipelines to provide additional information to test the results of my
24 analysis against natural gas industry peers.

25 **Q. How is the remainder of your Direct Testimony organized?**

26 A. Section II describes the scope of my study and a summary of my analyses and
27 conclusions. This section also includes a discussion of the major causes of my

1 recommended changes to MGT's depreciation accrual rates as compared to the currently
2 used depreciation rates. Section III provides a discussion of the major influences impacting
3 the study completed on behalf of MGT.

4 **II. SCOPE OF THE DEPRECIATION STUDY**

5 **Q. Please outline the scope of your Depreciation Study for MGT.**

6 A. My depreciation study report sets forth the results of my analysis regarding the
7 transmission and general plant assets of MGT, through which I determined the appropriate
8 annual book depreciation accrual rates and amounts applicable to MGT's original cost of
9 plant investment, as of October 31, 2020. My recommended depreciation rates and
10 expense amounts are based on the Straight-Line Method, incorporating the Average Life
11 Group Procedure applied on a Remaining Life Basis. My report also describes the
12 concepts, methods and judgments that underlie the recommended annual depreciation
13 accrual rates related to the MGT gas plant in service.

14 My study also describes my derivation of a separate set of annual accrual rates for the
15 recovery of the funds necessary for the future removal of MGT's pipeline system assets (i.e.,
16 net negative salvage provisions).

17 **Q. Please outline the information included in your depreciation study report.**

18 A. The depreciation study report is presented in nine sections:

19 Section 1 Study Highlights, presents a brief summary of the depreciation study and
20 results.

21 Section 2 Contains statements with respect to the plan and the basis of the study.

22 Section 3 Development of the Required Depreciation Rates, presents descriptions of
23 the methods used and factors considered in the service life study.

24 Section 4 Criteria and Consideration for use in the Development of an Economic
25 Planning Horizon/Truncation Dates/Life Span Dates Summary.

26 Section 5 Calculation of Annual and Accrued Depreciation, presents the methods
27 and procedures used in the calculation of depreciation.

1 Section 6 Results of Study, presents summaries by depreciable group of annual and
2 accrued depreciation in Tables 1A and 1B.

3 Section 7 Presents the results of the Retirement Rate Analysis.

4 Section 8 Presents the results of the Detailed Depreciation Calculations.

5 Section 9 Estimation of Survivor Curves, is an overview of Iowa curves and the
6 Retirement Rate Analysis.

7 **Q. Was the depreciation study prepared using generally accepted standard methods and**
8 **practices?**

9 A. Yes. I utilized a widely accepted method for the study of the Company's historic data,
10 known as the Retirement Rate Analysis Method. The Retirement Rate Analysis Method is
11 generally accepted as the correct method to use when aged data is available for review.
12 MGT provided aged data for the period from 2006 to the present, which we incorporated
13 into our database. Given the availability of reliable aged data, I prepared the study of
14 mortality history using the retirement rate method. A detailed discussion of the retirement
15 rate analysis is presented in Section 9 of my depreciation study report.

16 Additionally, the service life study included:

- 17 • a review of MGT company practices and outlook, as they relate to plant
18 operation and retirement;
- 19 • consideration of current practice in the pipeline industry, including knowledge
20 of service life estimates used for other pipeline companies; and
- 21 • informed professional judgment which incorporated analyses of all of the above
22 factors.

23 As described in later sections of my testimony and report, I base my proposed
24 depreciation and net negative salvage accrual rates on generally accepted methods and
25 procedures for deriving depreciation lives and rates. These methods are generally accepted
26 for use in the development of depreciation rates for regulated utilities.

1 **Q. Please provide a summary of the results of the depreciation study.**

2 A. The study results in an annual depreciation expense accrual related to the recovery of
 3 original cost (i.e. excluding net negative salvage requirement) of approximately \$8.2
 4 million (a composite depreciation rate of 2.58%), when applied to depreciable plant
 5 balances, as of October 31, 2020. In addition, the study recommends a separate annual
 6 accrual for net negative salvage of approximately \$3.2 million (being a second annual
 7 accrual rate of 1.02%). The study results are summarized at an aggregate functional group
 8 level as follows:

9 **SUMMARY OF ORIGINAL COST, ACCRUAL PERCENTAGES AND AMOUNTS RELATED TO RECOVERY OF**
 10 **ORIGINAL COST OF INVESTMENT**

Plant Group / Accounts	Original Cost	Annual Accrual	Annual Accrual
Transmission Plant	\$306,202,629	\$6,862,384	2.24%
General Plant	\$10,869,386	\$1,331,938	12.25%
TOTAL	\$317,072,015	\$8,194,322	2.58%

11
 12
 13 **SUMMARY OF ORIGINAL COST, ACCRUAL PERCENTAGES AND AMOUNTS RELATED TO COST OF**
 14 **REMOVAL (NET NEGATIVE SALVAGE)**

Plant Group / Accounts	Original Cost	Annual Accrual	Annual Accrual
Transmission Plant	\$306,202,629	\$3,220,303	1.05%
General Plant	\$10,869,386	\$0	0%
TOTAL	\$317,072,015	\$3,220,303	1.02%¹

15
¹ The annual accrual related to net negative salvage when applied to only assets accruing net negative salvage is 1.13%. The annual accrual related to net negative salvage when applied to all assets in service is 1.02%.

1 **III. MAJOR INFLUENCES IMPACTING THE DEPRECIATION STUDY**
2 **RECOMMENDATIONS**

3
4 **Q. Please outline the purpose of depreciation and factors to consider in the completion of**
5 **a depreciation study**

6
7 A. Depreciation, as applied to depreciable gas plant, means the loss in service value not
8 restored by current maintenance, incurred in connection with the consumption or prospective
9 retirement of gas plant in the course of service from causes which are known to be in current
10 operation and against which the utility is not protected by insurance. Among the causes to be
11 given consideration are wear and tear, decay, action of the elements, inadequacy,
12 obsolescence, changes in the art, changes in demand and requirements of public authorities,
13 and, in the case of natural gas companies, the exhaustion of natural resources.²

14 When considering the action of the elements, the average service life and net negative
15 salvage calculations historically have considered large catastrophic and legislative events
16 that have occurred and impacted the life and net negative estimates of utilities across North
17 America, including:

- 18
- Statutory and regulatory changes;
 - forest fires;
 - earthquakes;
 - tornadoes;
 - ice storms;
 - wind storms;
 - large scale flooding;
 - fires;
 - lightning;
 - intentional actions of third parties;
and
 - other forces of nature.

1 Depreciation, as used in accounting, is a method of distributing fixed capital costs, less
2 net negative salvage, over a time period by allocating annual amounts to expense. Each

² 18 CFR part 201 (Uniform System of Accounts Prescribed for Natural Gas Companies Subject to the Provisions of the Natural Gas Act – Definitions).

1 annual amount of such depreciation expense is part of that year’s total cost of providing
2 natural gas utility service. Normally, the time over which the fixed capital cost is allocated
3 to the cost of service, is equal to the time over which an item renders service—that is, the
4 item’s service life. The most prevalent method of allocation is to distribute an equal amount
5 of cost to each year of service life. This method is known as the Straight-Line method of
6 depreciation.

7 **Q. Please outline the major influences of the depreciation rates as determined in the**
8 **depreciation study.**

9
10 A. The three major influences in the depreciation study included a review and
11 modification to:

- 12 • the Economic Life (or Economic Planning Horizon);
- 13 • changes to the average service life estimates; and
- 14 • changes to the annual accrual rate required in order to recover the currently
15 estimated cost of retirement (net negative salvage).

16 Each of the influences are discussed in detail in the following sections.

17
18 **ECONOMIC PLANNING HORIZON**

19
20 **Q. Your Study is premised on the use of the concept of an Economic Planning Horizon**
21 **(“EPH”) or economic life in development of depreciation rates. Please discuss this**
22 **concept for large diameter pipelines, such as MGT’s transmission system.**

23 A. Long life assets such as those comprising MGT’s transmission system are restricted
24 not only by physical forces of retirement such as wear and tear and physical deterioration,
25 but also, and to a much greater extent, by economic forces of retirement. Generally,
26 physical forces of retirement are less likely to occur than retirement of large portions of the
27 pipeline system due to economic forces. Specifically, the economic exhaustion of natural
28 gas supply, the changing North American marketplace for natural gas demand, the rapidly
29 emerging trend of decarbonization legislation, and the competitive influences of supply
30 originating throughout North America all have a significant impact on the estimated service
31 lives of the MGT transmission system.

1 There are several factors affecting the economic viability of the pipeline system.
2 The amount of conventional reserves is finite. Long life assets, such as natural gas
3 pipelines, are subject to a number of different forces of economic retirement, including
4 increased competition, changes in either supply or market conditions, changes in legislation
5 constricting the use of carbon-based fuels, or other factors that can cause a change in
6 utilization of a pipeline system.

7 The concept referred to with the terms “economic planning horizon,” “economic
8 life,” or “truncation date” (each of which have similar meaning within depreciation
9 literature) is one of the parameters used to set depreciation rates that accurately reflect the
10 annual consumption in service value. Appropriate depreciation rates also help to ensure
11 that both long-term intergenerational equity among customers and a reasonable opportunity
12 for the recovery of investment are achievable.

13 The pipeline system will experience both interim and final retirement activity. Interim
14 or ongoing retirements represent those retirements described by the interim survivor curve,
15 which is commonly referred to as the Iowa curve. Terminal or final retirements represent
16 those retirements described by the truncation of the interim survivor curve at the truncation
17 date (or economic life), which I conclude for MGT to be 2050, as discussed in detail below.
18 Interim retirements include retirements related to replacements that are primarily caused by
19 wear and tear, deterioration, and technological obsolescence, i.e. the replacement of an item
20 of equipment with a newer item with greater functionality. Terminal retirements include
21 retirements related to the final abandonment of major components of the system caused by
22 the economic obsolescence of the system. Such retirements are not expected to occur all at
23 once. Rather, it is anticipated that there will be a relatively restricted period during which
24 these major retirements will occur. In order to readily perform the mathematical calculations
25 of average and remaining life, the timing of the terminal and final retirements is represented
26 by a single point, the EPH (or life span date).

27 An EPH is an estimate at a point in time based on the current information and
28 evaluation of the factors described in this testimony. As I discuss later, the use of the term
29 “horizon” within my testimony and report is meant to convey that this date is not a firmly
30 established “end of company” date, but rather a reasonable period over which the pipeline

1 has a reasonable ability to forecast the key considerations. In fact, most large diameter
 2 interstate (or interprovincial) pipelines regulated by either FERC or the Canadian Energy
 3 Regulator (“CER”), formerly known as the National Energy Board of Canada (“NEB”), have
 4 included EPH dates since at least the early 1980s in the calculation of depreciation rates.
 5 Additionally, subsequent new pipeline systems have also included EPH dates with their
 6 initial applications for depreciation rates to federal regulators in Canada and the United
 7 States (“U.S.”). In virtually all cases, the pipelines’ EPH periods have been determined with
 8 the concept of a lookout of the known supply, demand, and contractual considerations over
 9 a reasonable period. In this manner, the pipeline is providing a reasonable level of assurance
 10 of the recovery of invested capital for their shareholders, while at the same time providing
 11 generational equity to the current and future users of the pipeline system.

12 **Q. Please explain the import of the horizon presumed in the EPH.**

13
 14 A. The concept of a “horizon” is meant to highlight that the EPH is a rolling target. For
 15 example, the use of a 30-year EPH to support proposed depreciation rates five years ago
 16 would not mean that the pipeline would be required to use a 25-year EPH in a current
 17 application. In fact, for many years the FERC and the NEB approved depreciation rates
 18 with a 25-year EPH in a number of successive applications for the same pipeline company.
 19 For example, a 1980 application may have included a 25-year EPH of 2005, then a 1985
 20 application may have used a renewed 25-year EPH ending in 2010, and in 1990, the same
 21 pipeline may have renewed the 25-year EPH to end in 2015, all based on the best
 22 knowledge of the critical factors at the time of each successive application.

23 The underlying concept of the EPH requires that the economic circumstances be
 24 periodically revisited, generally at the time of a comprehensive depreciation study. During
 25 these reviews, any changes to EPH will hinge on the principles of depreciation, as noted in
 26 Section 3.1 of my report. As such, the recovery of invested capital through the inclusion
 27 of depreciation expense in the revenue requirement must recognize and balance the
 28 following principles:

- 29 • matching benefits to costs—the benefit of an asset should be effectively matched
 30 with the costs of the volumes that ultimately deliver that value;

- 1 • inter-generational equity—tomorrow’s customers should not be burdened for
- 2 benefits of assets that today’s customers receive, or vice versa; and
- 3 • circumstances impacting the EPH change over time—updates to EPH are
- 4 conducted as service life is better understood and asset value is ultimately matched
- 5 over a time horizon based on the known information at the time of each study.

6 Current and anticipated economic conditions impact pipeline utilization and the
 7 service lives of the assets and their components, and thus require periodic updates to ensure
 8 that the depreciation expense component of the revenue requirement reflects the above
 9 principles. EPH is one of the underlying drivers of estimated service life, and as
 10 assumptions change, EPHs and resulting depreciation rates require updating.

11
 12 **Q. Pease expand on your comment that FERC has approved the use of depreciation rates**
 13 **based on an EPH concept.**

14 A. The use of a 25-year EPH was commonly approved by both the FERC and the NEB
 15 since the 1980s. In the late 1990s through to the early 2000s, 30-year EPHs were common,
 16 and though the mid 2010s, 35-year EPHs were commonly used. However, in recent years,
 17 I have noticed that EPH’s of 30 and 25-years have become more common again, with some
 18 pipeline systems recognizing very difficult supply and competitive influences resulting in
 19 EPH dates shorter than 25-years.

20 FERC has had a long history of allowing depreciation rates calculated with an
 21 economic end-life or truncation period, as noted in its decision in *El Paso Natural Gas*
 22 *Company*, Opinion No. 528, 145 FERC ¶ 61,040, at P 116 (2013). In addition, FERC Trial
 23 Staff witnesses have consistently relied on the concept of economic end-life.³ The
 24 economic end-life as referred to in the Bieltz Testimony has been defined as “the point in
 25 time when a company will cease operations and terminally abandon its system,” and that

³ See, e.g., Trailblazer Pipeline Company LLC, Docket RP18-922, Exhibit No. S-0012 (Prepared Direct and Answering Testimony of Andrew M. Bieltz Witness for the Trial Staff of the Federal Energy Regulatory Commission), at 10 (Aug. 29, 2019) (“Bieltz Testimony”); Enable Mississippi River Transmission, LLC, Docket RP18-923-004 (Prepared Answering Testimony of Christopher Skorski Witness for the Trial Staff of the Federal Energy Regulatory Commission), at 8-9 (July 25, 2019) (“Skorski Testimony”).

1 “point in time [is] generally [] a function of the end of either the resource of *supply* or the
2 market *demand* for this resource”.⁴ Additionally, FERC Trial Staff witnesses have
3 recognized that “[t]he concept of remaining economic life is intended to allow the pipeline
4 the opportunity to recoup its investment in plant over its estimated useful life.”⁵ The
5 “economic life” concept discussed by FERC Trial Staff witnesses is the same as the EPH
6 concept, just different terminology.
7

8 **Q. Please describe the factors used in the determination of the EPH for MGT.**

9 A. The estimation of the anticipated economic life is based on the consideration of several
10 factors. While some of these considerations can be considered as “criteria” for the
11 development of an economic life from a theoretical standpoint, it is important to note that
12 all factors affecting economic life should be considered. In some cases, the appropriate
13 EPH date is developed from the merging of a number of these factors.

14 Consideration of the following factors is required to determine a pipeline’s proper
15 economic planning horizon:

- 16 • availability of, or constriction to, market demand;
- 17 • availability of supply to the pipeline;
- 18 • consumption of service value;
- 19 • engineering-based retirement studies;
- 20 • competitiveness of the pipeline;
- 21 • opportunity for the recovery of the investment;
- 22 • projected long-term use of the pipeline;
- 23 • approved economic planning horizons of peer companies; and
- 24 • management discretion.

25 Below is a more detailed discussion of these criteria and considerations for estimating
26 a pipeline system’s remaining economic life.

⁴ Bieltz Testimony at 9.

⁵ Skorski Testimony at 9.

1 **Q. Please discuss your analysis of the availability of markets to consume the available**
2 **natural gas supply, including constraints to the market for natural gas.**

3 A. For the pipeline to be economic, two things must be present: (1) it must have product
4 available to be transported; and (2) it must have market demand for that product. The EPH
5 analysis of market demand considers that the economic life of a pipeline is directly tied to
6 the ability of a market to consume the supply available from that pipeline. The market must
7 be accessible to the pipeline either directly or via an additional or further transportation
8 source. In other words, the delivery of product from one pipeline into another pipeline that
9 can directly access an anticipated market would be considered as market demand to the
10 originating pipeline. However, in this case, the economic life of the originating pipeline
11 should not exceed the economic life of the second pipeline. The competitiveness of the
12 product being transported when compared to alternative energy sources, also must be
13 considered. For example, if it is expected that natural gas will be displaced by liquefied
14 natural gas within a certain market, the extent of the displaced demand must be considered.

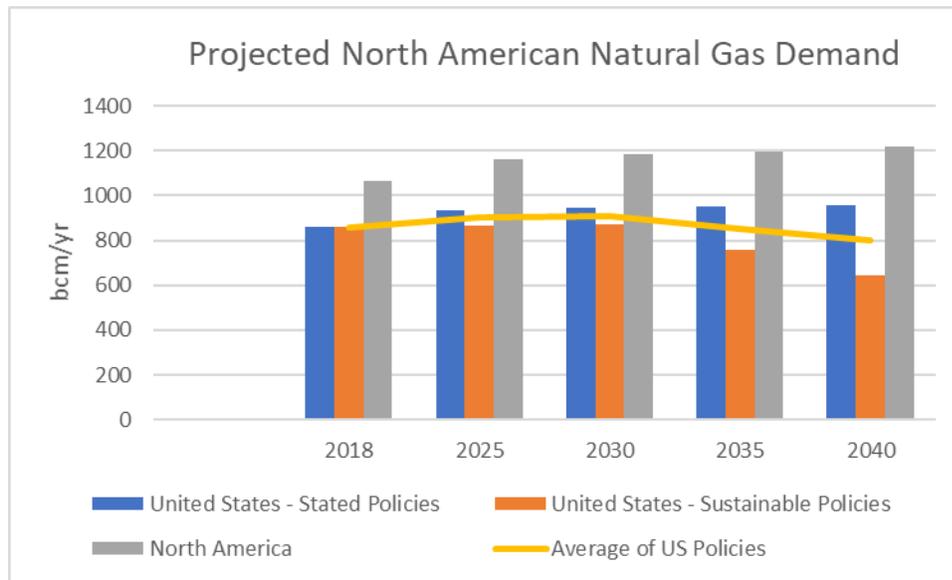

15 Evaluation of the marketplace to consume the product over a long term should also
16 consider the potential for governments to implement decarbonization initiatives to reduce
17 greenhouse gas emissions. Such decarbonization issues need to be reviewed to determine
18 the impact of the legislation on the consideration of natural gas as a target of the
19 decarbonization, or in the context of natural gas to be a potential short-term or long-term
20 solution to meeting the goals of the various legislation.

21 Review of the market demand considerations of the MGT system need to consider that
22 the pipeline includes three major connection points to other large natural gas transmission
23 systems in addition to direct connections to local distribution systems and industrial
24 customers. Given the broad system design, the market demand must consider the ability to
25 meet the broader U.S. midwest and east coast natural gas demand. Additionally, MGT is
26 well positioned to utilize its broad supply base to serve the anticipated long-term demand for
27 Liquefied Natural Gas (“LNG”) facilities and export markets.

1 Current natural gas demand forecasts have started to recognize the impact of
 2 decarbonization legislation. For example, the 2019 World Energy Outlook provides two
 3 scenarios when analyzing the long-term natural gas demand: (1) the Current Policies (Stated)
 4 scenario, which generally considers that current energy development and use policies remain
 5 unchanged; and (2) a Sustainable Development Scenario, which provides a strategic pathway
 6 to meet climate, air quality, and energy access goals in full.

7 The following chart provides the World Energy Outlook for both the North American
 8 Stated and Sustainable Polices scenarios.

9

10

11 Source: World Energy Outlook – 2019; Published by the International Energy Agency, page 180

11

12 Since the 2019 World Energy Outlook, there has been a significant acceleration away
 13 from natural gas demand, as a number of state and federal governments have either enacted
 14 carbon reduction legislation or have outlined carbon reduction targets. It is my
 15 understanding that as of mid-2020, twelve U.S. states have committed to 100% renewable
 16 or clean energy goals,⁶ and it can be reasonably expected that many additional states and

16

⁶ The list of states include: Arizona, California, Colorado, Connecticut, District of Columbia, Hawaii, Minnesota, Nevada, New Jersey, New York, New Mexico, Rhode Island, Virginia Washington, and Wisconsin.

1 other governmental entities will adopt similar plans. Indeed, many municipal governments
 2 are adopting bans on new natural gas hookups and mandating new commercial construction
 3 to not include natural gas infrastructure. In some cases, these goals have been made law or
 4 executive order, while in other cases the targets are stated policy. Outside of legal
 5 requirements, utilities are independently adopting their own decarbonization plans.

6 During the recent U.S. Presidential election, the Biden campaign platform included
 7 significant policy regarding decarbonization, including commitment to:

- 8 • Creating millions of jobs to produce clean electric power;⁷
- 9 • Establishing a technology-neutral Energy Efficiency and Clean Energy
 10 Standard to increase competition in the market and incentivize higher
 11 utilization of assets—and achieve carbon free energy in electric generation by
 12 2035 by reforming and extending tax incentives;⁸
- 13 • Enacting legislation to set a new net-zero emission standard for all new
 14 commercial buildings by 2030;⁹
- 15 • Increasing federal procurement by \$400 billion in the first term for the purchase
 16 of clean energy inputs, like batteries and electric vehicles to help position the
 17 U.S as the world’s clean energy leader;¹⁰
- 18 • Creating a new Advanced Research Projects Agency on Climate to target
 19 technologies to help the U.S. achieve a 100% clean energy target;¹¹
- 20 • Reengaging the U.S. in the Paris Agreement under the United Nations
 21 Framework Convention on Climate Change (“Paris Agreement”);¹² and

⁷ See *The Biden Plan to Build a Modern, Sustainable Infrastructure and an Equitable Clean Energy Future*, Biden for President, <https://joebiden.com/clean-energy/> (last visited Feb 19, 2021) (“Biden Plan”).

- 1 • Cancelling construction of the TC Energy Keystone XL Pipeline Project.¹³

2 While each of the above could be classified as “campaign promises,” President Biden,
3 in a clear indication of the new administration’s commitment to climate change, immediately
4 upon inauguration signed an Executive Order committed to “Protecting Public Health and
5 the Environment and Restoring Science to Tackle the Climate Crisis,” which included the
6 revoking of the March 2019 Presidential Permit for the Keystone XL Pipeline.¹⁴ In a further
7 indication of the Biden Administration’s commitment to climate change, President Biden
8 also issued an extensive Executive Order on “Tackling the Climate Crisis at Home and
9 Abroad,”¹⁵ which unveiled detailed climate plans designed to ensure his campaign
10 commitment that the U.S. achieves a 100% clean energy economy and net-zero emissions
11 no later than 2050.¹⁶

12 President Biden’s Executive Orders include the following:

- 13 • cancellation of the Keystone XL Pipeline project, and directing agencies to
14 review and reverse more than 100 Trump Administration actions on the
15 environment;¹⁷
- 16 • raising climate change awareness and making a positive contribution to the 26th
17 United Nations Climate Change Conference of the Parties and beyond;¹⁸
- 18 • reconvening the Major Economies Forum on Energy and Climate, beginning with
19 the Leaders’ Climate Summit, to include pursuit of green recovery efforts,
20 initiatives to advance the clean energy transition, sectoral decarbonization, and
21 alignment of financial flows with the objectives of the Paris Agreement;¹⁹

¹³ Jason Silverstein, *Biden campaign says he’ll revoke Keystone XL pipeline permit if elected*, CBS News, <https://www.cbsnews.com/news/biden-campaign-keystone-xl-pipeline-permit-revoke/> (May 15, 2019, 4:01 PM).

¹⁴ Exec. Order No. 13,990, Fed. Reg. 7,037, section 6 (Jan. 25, 2021) (“Executive Order 13,990”).

¹⁵ Exec. Order No. 14,008, 86 Fed. Reg. 7,619 (Jan. 27, 2021) (“Executive Order 14,008”).

¹⁶ *See* Biden Plan.

¹⁷ Executive Order 13,990 at section 6.

¹⁸ Executive Order 14,008 at section 102(a).

¹⁹ Executive Order 14,008 at section 102(b).

- 1 • immediately beginning the process of developing its nationally determined
2 contribution under the Paris Agreement;²⁰ and
- 3 • ordering that federal agencies take steps to ensure that, to the extent consistent with
4 applicable law, federal funding is not directly subsidizing fossil fuels. The Director
5 of the Office of Management and Budget shall seek, in coordination with the heads
6 of agencies and the National Climate Advisor, to eliminate fossil fuel subsidies
7 from the budget request for Fiscal Year 2022 and thereafter.²¹

8 These immediate actions of the Biden Administration provide a clear signal to the level
9 of commitment to implement carbon reduction policies. In re-committing to the Paris
10 Agreement, the U.S. agreed to a requirement to provide details outlining a strategy to meet
11 the Agreement goals. The U.S. had committed to cutting overall greenhouse gas emissions
12 by 26 to 28 percent below 2005 levels by 2025. The U.S. initiatives initially included
13 commitments to achieve the target, including the Clean Power Plan (a state-by-state
14 program to cut carbon pollution from the power sector) and the tightening of automotive
15 fuel economy standards to reduce transportation emissions—both policies the Biden
16 Administration has committed to strengthening. The generation of clean power was clearly
17 a stated goal of President Biden.

18 Construction of natural gas-fired electric generation plants has increased over the past
19 few years to replace the electric power demand left by the retirement (or near-term expected
20 replacement) of coal-fired electric generation. Demand from such natural gas-fired power
21 plants is likely to crest and decline as more renewable and storage generation facilities are
22 added to the resource mix and states progress toward their decarbonization goals. Further,
23 the emissions from the natural gas-fired plants will need to be eliminated or offset to meet
24 decarbonization goals, reducing demand for natural gas elsewhere. The following chart is a
25 non-exhaustive summary of regulated utilities with public targets relating to the impact of
26 decarbonization to electric power generation.

²⁰ Executive Order 14,008 at section 102(e).

²¹ Executive Order 14,008 at section 209.

Utility	Public Target
APS	100% carbon free by 2050
Avista	100% clean by 2045
Duke Energy	Net-zero by 2050
Dominion	Net-zero by 2050
DTE Energy	Net-zero by 2050
Green Mountain Power	100% renewables by 2030
Idaho Power	100% clean by 2045
PNM	100% carbon free by 2040
SMUD	100% carbon free by 2040
Xcel Energy	100% zero-carbon by 2050

Review of the various state and federal legislation and decarbonization targets contain various reductions to the use of carbon-based fuels for residential heating and appliances. For example, New York State and the City of New York have both recently passed climate change laws. On the state side, the New York State Climate Leadership and Community Protection Act (“CLCPA”) became effective in January 2020. The CLCPA targets a 40 percent decrease in statewide greenhouse gas emissions by 2030 (relative to 1990 levels) and an 85 percent decrease in statewide greenhouse gas emissions by 2050 (relative to 1990 levels). The CLCPA provides for a Climate Action Council that will develop and approve a scoping plan with draft recommendations to achieve these statewide greenhouse gas emissions reductions by January 1, 2022, and final recommendations by January 1, 2023. The New York State Department of Environmental Conservation must then adopt implementing regulations by January 1, 2024. The CLCPA also amends the New York State Public Service Law so that the New York Public Service Commission (“NYPSC”) can establish a program to attain the CLCPA’s goals that: (1) a minimum of 70 percent of the statewide electric generation secured by jurisdictional load serving entities to meet the electric requirements for all New York State customers in 2030 be generated by renewable energy systems; and (2) a zero emissions target of the statewide electrical demand system

1 by the year 2040. Under the CLCPA, the NYPSC has the flexibility to modify the
2 obligations of jurisdictional load serving entities and/or the targets. The NYPSC may also
3 temporarily suspend or modify the obligations under such program if it finds the program
4 impedes the provision of safe and adequate electric service, is likely to impair existing
5 obligations and agreements, and/or that there is a significant increase in arrears or service
6 disconnections related to the program.

7 At the local level, a number of cities have implemented various levels of bans on
8 natural gas residential appliances and on natural gas residential heating. Berkeley, California
9 was the first U.S. city to ban natural gas in new residential construction in July 2019.²² This
10 was followed by 39 additional California cities passing a natural gas ban in new building
11 construction in 2019 and 2020. The City of New York passed Local Law 97 in April 2019,
12 which sets citywide emissions reductions targets and requires certain buildings to meet
13 specified emissions limits or implement energy conservation measures.²³ The targets include
14 40 percent reductions in greenhouse gas emissions by 2030 and 80 percent reductions in
15 such emissions by 2050 (from 2005 levels). In addition, the Mayor of the City of New York
16 issued Executive Order No. 52 on February 6, 2020, directing a comprehensive review of
17 the City of New York's agencies' process for approving or allowing additional infrastructure
18 that expands the supply of fossil fuels or contributes to extending the period of time during
19 which there is reliance on the use of fossil fuels.²⁴ I also note that the city of Seattle,
20 Washington passed local government legislation banning natural gas hookups in new
21 buildings in 2020.

22 The MGT system receives from most of the North American supply Basins, and can
23 provide support delivery to a large portion of the U.S. MGT can also support LNG facilities
24 that support international demand. MGT, like other natural gas pipelines, may be susceptible
25 to declines in longer-term demand due to the impact of climate change legislation. Given

²² Kristoffer Tigue, *San Francisco Becomes the Latest City to Ban Natural Gas in New Buildings, Citing Climate Effects*, Inside Climate News (Nov. 13, 2020), <https://insideclimatenews.org/news/13112020/san-francisco-natural-gas-ban/>.

²³ City of New York, NY, Local Law No. 97 (2019).

²⁴ The City of New York Office of the Mayor Executive Order No. 52 (Feb. 6, 2020).

1 the wide-spread use of the targets for decarbonization by 2030, 2035, and 2050, and likely
 2 increased adoption of such targets by other governmental entities and utilities going forward,
 3 it cannot be considered that an EPH beyond the year of 2050 is viable for rate-making
 4 purposes. Indeed, President Biden’s 2050 net-zero decarbonization plan further underscores
 5 the validity of an EPH no longer than 30 years.

6 **Q. Please discuss your analysis of the availability of natural gas supply available to the**
 7 **MGT system.**

8 A. In the EPH analysis, this criterion is the point in time that available supply
 9 permanently declines to a level of 50 percent of the peak supply capacity of the pipeline.
 10 This criterion assumes that the pipeline system would generally retire in a linear rate relative
 11 to the decline in throughput, such that the rate of decline can identify the key points of
 12 significant retirement such as a line of pipe or compression station. In other words, if the
 13 throughput is forecast to permanently decline by 25 percent, the use of this criterion would
 14 indicate that approximately 25 percent of the pipe and compression equipment may be
 15 subject to retirement. In this manner, it is assumed that when the throughput declines to a
 16 level of 50 percent of the historical peak throughput capacity, the mid-point of substantial
 17 retirement of physical facilities will also be reached.

18 The MGT pipeline system is unique as compared to many other large diameter
 19 federally regulated natural gas pipelines. MGT is able to access natural gas supply from
 20 numerous North American supply basins through connecting pipeline access. As the
 21 primary gas supply available to MGT is essentially from all areas of North America, the
 22 EPH consideration related to gas supply needs to include the consideration of the North
 23 American wide supply sources.

24 The major receipt points of the MGT system via large diameter pipelines providing
 25 access to most of this production includes the following:

- 26 • Via the Chicago Hub at Joliet, Illinois :
 - 27 ○ ANR Pipeline Company;
 - 28 ○ Natural Gas Pipeline Company of America;

- 1 ○ Northern Border Pipeline Company;
- 2 ○ Northern Natural Gas Company;
- 3 ○ Alliance Pipeline;
- 4 ○ Panhandle Eastern Pipeline Company;
- 5 ○ Horizon Pipeline;
- 6 • Via the Rockies Express Pipeline receipt/delivery connection, which
- 7 provides access to major supply basins in the Rocky Mountain and
- 8 Appalachian regions and though the bi-directional design serves energy
- 9 markets across a vast segment of North America.
- 10 • Via Tennessee Gas Pipeline LLC connection, which provides direct access
- 11 to supply from the U.S. Gulf Coast.

12 Based on the multiple supply basins available to the pipeline, the bi-directional nature
13 of the pipeline and long term U.S. production estimates, the consideration of supply
14 constraints related to the determination of an EPH are minimal over the next 30-year period
15 over which the market demand analysis indicates a demand for available supply.

16 **Q. Please discuss the concept of Consumption of Service Value in the determination of an**
17 **EPH.**

18 A. The EPH based on this criterion is the point in time that a permanent reduction of
19 throughput equal to 50 percent of historical pipeline capacity is reached for a single line
20 pipeline system. The forecast of a decline in throughput to 50 percent of capacity can be
21 based on either supply or market demand forecasts.

22 In rate-regulated environments, the revenue generation potential is based on the units
23 being transported within the pipeline. As such, over the long term, the expiry of the service
24 value of a pipeline can be directly dependent upon the flows of product through the pipeline,
25 or upon the long-term utilization of the pipeline. The utilization of the line can be measured
26 as a percentage of the capacity of the pipeline. In other words, if it is estimated that the long-
27 term utilization rate of a pipeline is permanently declining, it follows that the service value
28 of the pipeline to its investors is also declining.

1 One approach to measure service value consumption is to assume that the investment
 2 in the asset is retired as the long-term service value is diminished due to permanent reduction
 3 in throughput. Under this approach, if the throughput was estimated to permanently decline
 4 to 75 percent of the pipeline capacity, 25 percent of the original cost of the pipeline would
 5 be retired. As such, it is conceivable that retirements of a pipeline system could occur in
 6 phases over a long term. In this scenario, pipeline flows may eventually fall to a level where
 7 the pipeline is uneconomic and would be retired. If consideration was given to this type of
 8 retirement practice (i.e., retirement based on utilization rates), it is practical to consider
 9 factors such as the above two criteria for development of truncation dates on pipeline. In
 10 this circumstance, the truncation date of a single line system could be based on the mid-point
 11 of long-term throughput estimates based on either supply or market demand forecasts.
 12 Concentric notes that in the specific circumstance of this review, the consumption of service
 13 value of the transmission line has not been studied in decline as the long-term forecasts of
 14 demand versus capacity.

15 **Q. Has an Engineering Based Retirement Study been performed for the MGT system?**

16 A. The EPH date based on this criterion is the point in time that 50 percent of the
 17 currently installed facilities are forecast to be retired based on a detailed engineering-based
 18 long-term retirement forecast. Use of the supply or market-based estimates of throughput
 19 are designed to develop proxies for the actual retirement of facilities. In the circumstances
 20 where the use of proxies is not desired, the estimation of the physical retirement of facilities
 21 based on engineering models would be required. In this case, the estimated flows (based on
 22 either or both supply and marketplace) would drive a model to develop optimum system
 23 configurations at differing throughput levels. Based on the resultant configurations, a list of
 24 facilities to be retired at various stages can be developed.

25 While this method removes the need for any type of proxy, it requires a very significant
 26 amount of analysis, and even small changes in throughput can result in very different system
 27 configurations and resultant retirement estimates. Given the time and work associated with

1 this method, its use in the analysis of various throughput scenarios becomes time consuming
2 and cumbersome.

3 Additionally, as discussed under criterion related to Consumption of Service Value,
4 the service value of the pipeline system is directly dependent upon the flows of product
5 through the system. As such, retirements based on abandonment of physical assets may not
6 reflect the consumption of service value. It is not possible to physically abandon a pipeline
7 segment that still is transporting less than 50 percent of its capacity, even though it has lost
8 over half of its service value to the company. Therefore, use of this criterion is not useful in
9 the circumstances of single segment pipeline systems. Additionally, use of engineering-
10 based estimates requires a significant number of assumptions in the estimates of system
11 configurations, which can lead to variability of results. As such, an engineering-based
12 retirement study has not been performed

13 **Q. Please discuss the competitiveness of the MGT system.**

14 A. This criterion requires a probability analysis to determine whether alternative
15 transportation sources are consuming some of the available supply or meeting market
16 demand. In essence, this criterion would be considered in addition to the other supply- and
17 market-based criteria. Given MGT's connectivity to various supply basins and large
18 markets, the competitiveness of MGT's system is aligned to the competitiveness of the
19 connecting pipelines.

20 **Q. Please discuss MGT's systems opportunity for the recovery of investment.**

21 A. Investors in regulated utilities have an expectation of both a reasonable return on the
22 investment made and the recovery of that investment. The development of an economic life
23 should not extend beyond a period in which a prudent investor would place capital at risk.
24 Often, debt holders or institutions financing the investment will require the recovery of the
25 capital investment over a set period of time.

26 In the development of an economic life, two factors must be balanced. First, the
27 economic life should not be set too long, because that would result in undue risk of stranded

1 investment. For example, the various state and federal government legislated or stated policy
2 decarbonization targets, like President Biden's 2050 net-zero decarbonization plan, as
3 discussed in the market demand considerations, weigh into the consideration of EPH. This
4 criteria becomes more relevant when statutory or regulatory changes increase the risk of
5 stranded assets. Second, the economic life should not be set too short, because that would
6 create intergenerational equity concerns. Thus, an optimally-determined economic life will
7 provide for maintenance of rate base over a term that both minimizes stranded investment
8 risk, while recognizing, as much as possible, cost causation and beneficiary-pays principles.

9 **Q. Please discuss any analysis regarding the long-term use of the pipeline.**

10 A. The long-term use of the pipeline must be considered. In this scenario, a pipeline's
11 flow may fall to a level of where the pipeline is no longer economic and would be retired.
12 However, the use of the pipeline should be for use of the asset in similar service. For
13 example, conversion of a gas pipeline to alternative service would not be considered an
14 extension of the use of the asset. While the physical asset may continue to be used, it will
15 be used in a divergent service, and likely subjected to a different regulatory environment. If
16 it is anticipated that an alternative use of the asset is likely (i.e., pipeline to water service),
17 such recognition would be made in the consideration of the net negative salvage estimates
18 (the net negative salvage indication would either be less negative or perhaps positive to
19 recognize the sale of the pipe to a water utility), rather than in the life estimate of the asset.

20 In circumstances where the pipeline could be temporarily removed from service, the
21 probability of the pipeline returning to similar service would need to be considered. As such,
22 the economic life of a pipeline may not end when it is first removed from service, but beyond
23 that point in time for a reasonable period while alternative supply and market forces are
24 considered. If alternative supply sources are established, the economic life of the pipeline
25 should be reestablished based on the revised circumstances. If alternative sources are not
26 found within a reasonable period, the remaining net book value should be recovered in an
27 accelerated manner.

1 I have been provided with no evidence or information to suggest that, following
2 retirement from gas service, MGT's pipeline facilities might be repurposed. Thus, in
3 evaluating the relevance of this consideration, I have not assumed any future, long-term
4 alternative use of MGT pipeline assets.

5 **Q. Please provide a review of any peer analysis regarding approved economic life of peer**
6 **companies.**

7 A. The approved economic life of other pipelines should be reviewed to determine the
8 regulatory acceptance (through a litigated order or approval of a settlement) and various
9 economic lives of other similar companies. This review will also ensure the competitiveness
10 of the pipeline against any competing pipelines. The economic life should not be solely
11 based on the other pipelines; rather the other pipelines should be used as a check of
12 reasonableness of economic life being considered. I note that FERC has largely accepted
13 EPHs ranging from 25 to 35 years, with recent EPHs for similar pipelines using 30-year
14 EPH.

15 **Q. Please discuss the role of management discretion in the selection of an EPH.**

16 A. The inclusion of a truncation date (or economic life) into the depreciation rate
17 calculations can have a significant influence on the amount of depreciation expense in the
18 revenue requirement and on the long-term earning potential of the company. As such, there
19 exists the need for management to carefully consider the criteria and method used to develop
20 the truncation date. Additionally, there also exists the need for management to undertake a
21 significant amount of discretion in the use of any of the methods discussed in this testimony.

22 The use of any of the criteria discussed in this testimony can and should be considered
23 among all the other rate and competitive influences that the pipeline may have in the delivery
24 of a product at a fair and reasonable rate to the ratepayer. However, it must be stressed that
25 eventual recovery of the original cost of investment (and estimated net negative salvage
26 requirements) should be reasonably expected. As such, a deferral of depreciation expense
27 in one year will require an increased expense in future years. If throughput is expected to
28 decline in future years, the rate impact of deferred depreciation will be exaggerated in the

1 future periods given the smaller billing determinants used to recover a larger amount of
2 expense.

3 **Q. Please outline your recommendation based on the criteria described in this testimony.**

4
5 A. While each of the above criteria must be considered to properly determine the EPH of
6 a natural gas pipeline, they must be evaluated, and accorded proper weight, based on the
7 specific facts and circumstances of the pipeline under review. In my evaluation of MGT's
8 EPH, the most relevant consideration is the forecast of the long-term natural gas demand
9 given the recent introduction of various local, state, and federal government
10 decarbonization policies.

11 Given the security of the supply, the demand that may be constrained through
12 decarbonization initiatives is a more critical factor than any substantial risk of the supply
13 constraints. In other words, demand for capacity on MGT's system is not driven by
14 producers seeking to get supply to market, but rather by constrained demand caused by
15 decarbonization initiatives.

16 Considering all of the factors, I find the use of a 30-year EPH expiring at October 31,
17 2050 to be proper and adequate for MGT. This 30-year EPH is consistent with the
18 anticipated decline in demand as forecast by the 2019 International Energy Agency Report,
19 but more importantly aligns to the targets suggested in President Biden's 2050 net-zero
20 decarbonization plan, Executive Orders, Paris Agreement, the State of New York's climate
21 change legislation, and the stated objective of a number of utilities, and local governmental
22 entities. To recommend an EPH beyond October 31, 2050, for the MGT system would
23 assume these targets will not be met. There is no evidence to suggest these targets will not
24 be met at this point in time. In fact, all available evidence suggests additional development
25 and adoption of decarbonization plans, and/or adoption of shorter timelines and more strict
26 standards. As such, the proposed depreciation rates derived from my detailed depreciation
27 calculations are based on an EPH date of October 31, 2050.

28

COST OF RETIREMENT

1
2
3 **Q. Please describe the concept of recovery of future net negative salvage (or cost of**
4 **retirement) by transmission pipelines.**

5
6 A. The recovery of net negative salvage cost in regulated companies' costs of service is
7 widely accepted in regulatory jurisdictions throughout North America, including FERC.
8 The total recovery of the service value of an asset is not simply the allocation of original
9 cost to expense. Rather, the total recovery of costs must include costs incurred to remove
10 the pipeline from economic service less any net negative salvage value of the property
11 retired.²⁵ In other words, the service value rendered by an asset, must reflect both its
12 original cost and its estimated net negative salvage cost.

13 Because depreciation rates designed to the recover the original cost of the investment
14 of assets over the assets' useful life do not include net negative salvage expenses, an
15 additional provision must also be made for the recovery of the estimated costs of retirement
16 and/or removal over the assets useful life through a second and separate rate specific to the
17 estimated cost of removal. My study has followed this widely used practice. To ensure
18 MGT is provided an opportunity to recover the net costs of removing its facilities from
19 service, I recommend a separate, 1.02% per annum accrual rate for the estimated cost of
20 retirement of assets.

21 **Q. Is recovery of net negative salvage provisions common within FERC and other**
22 **regulatory jurisdictions throughout North America?**

23 A. Yes. Most jurisdictions throughout North America recognize the regulatory benefit
24 and fairness to the inclusion of the recovery of the net negative salvage requirements over
25 the period that assets are providing regulatory service.

⁸The cost of removal includes the cost of demolishing, dismantling, tearing down or otherwise removing an electric plant, including the cost of transportation and handling incidental thereto.

1 **Q Please indicate your reasons for indicating FERC’s acceptance of net negative**
2 **salvage.**

3 A. FERC’s definition of depreciation for gas plant indicates that:

4 *Depreciation, as applied to depreciable gas plant, means the loss in*
5 *service value not restored by current maintenance, incurred in connection*
6 *with the consumption or prospective retirement of gas plant in the course*
7 *of service from causes which are known to be in current operation and*
8 *against which the utility is not protected by insurance. Among the causes*
9 *to be given consideration are wear and tear, decay, action of the elements,*
10 *inadequacy, obsolescence, changes in the art, changes in demand and*
11 *requirements of public authorities, and, in the case of natural gas*
12 *companies, the exhaustion of natural resources.²⁶*

13 AND

14 *Service value means the difference between original cost and net salvage value of*
15 *gas plant.²⁷*

16
17
18 In addition to the above definition as prescribed by FERC, which clearly indicates that the
19 net salvage is to be included in the determination of the service value to be depreciated, I
20 note a history over the past many years of allowing for a recovery of the net negative
21 salvage within the depreciation rate.

22 **Q. Has the recovery of costs of removal been allowed in prior MGT rate cases before**
23 **FERC?**

24 A. No. MGT has not been collecting a provision for the future costs of removal of the pipeline.

25 **Q. Does the inclusion of net negative salvage enhance the generational equity of the**
26 **depreciation expense to all users of the MGT system?**

27 A. Yes. As indicated in FERC’s definition of depreciation, the original cost of investment,
28 adjusted for the net negative salvage estimate, should be depreciated over the estimated
29 average service life of the assets. In this manner, users of the system who gain the benefit
30 of the asset in service are responsible for the total costs of the asset. This generational
31 equity aspect of recovery of the net negative salvage value becomes more relevant as costs

²⁶ 18 C.F.R. part 201 § 12(B).

²⁷ 18 C.F.R. part 201 § 37.

1 could be stranded due to increased legislation to the extent not previously witnessed by
 2 federally regulated pipelines. As previously indicated, the net negative salvage rate should
 3 not be set too low because that would create intergenerational equity concerns. If
 4 throughput is expected to decline in future years, the rate impact of deferred net negative
 5 salvage will be exaggerated in the future periods given the smaller billing determinants
 6 used to recover a larger amount of expense. As such, the need for an appropriate net
 7 negative salvage is becoming stark given the advancing decarbonization efforts.

8 **Q. Please outline the way the estimated costs of removal have been incorporated into your**
 9 **depreciation study.**

10 A. The estimates of net negative salvage were based primarily on professional
 11 judgment, relying in part on historical data, in part on comparison to peer companies, and
 12 in part on our professional experience in developing costs of removal for regulated pipeline
 13 assets. The analysis of historic net negative salvage activity considered gross negative
 14 salvage and cost of removal as recorded to the depreciation reserve account. Net negative
 15 salvages as a percentage of the cost of plant retired are calculated for each plant component
 16 on both annual and three-year moving average bases.

17 **Q. Please explain the meaning of a net negative salvage percentage of negative 15 percent**
 18 **for Account 367 – Mains as recommended in your Depreciation Study report.**

19 A. A net negative salvage percentage indicates that for every \$100 of original costs retired,
 20 it is estimated that MGT will incur \$15 of costs to retire the pipe. As it is expected that over
 21 the life of the pipeline, all of the investments made for the assets in the Mains account will
 22 retire, the expected costs of retirement can be made by multiplying the original cost surviving
 23 as of the study date by 15 percent. The result of this calculation provides a reasonable
 24 estimate of the long-term estimation of the costs that will be required to retire the assets in
 25 the Mains account.

26 **Q. Once the net negative salvage percentages are determined for each account, how are**
 27 **required amounts recovered through rates?**

28 A. As described in page 6-3 of my depreciation study, the requirement as determined above
 29 for each account is summarized. The amount of the current reserve for the future retirement

1 costs is subtracted from the total of the required amount to determine a future accruals
 2 amount. The future accruals amount is divided by the composite remaining of each account
 3 to determine a calculated annual amount. The sum of the annual accrual amount is summed
 4 to develop a total annual accrual amount that is divided by the original costs as of the study
 5 date to determine an overall net negative salvage rate. In the circumstances of MGT, the
 6 total overall net negative salvage rate is 1.02 percent. For the purposes of developing a
 7 revenue requirement, the 1.02 percent is applied to the total original cost forecast by MGT.
 8

9 **AVERAGE SERVICE LIFE ANALYSIS**

10 **Q. Please describe the major factors considered in the development of the average**
 11 **service life in the Transmission accounts.**

12 A. All of the Transmission accounts were analyzed a similar fashion. Using Account 367
 13 – Mains as an example, this discussion outlines the major considerations in my review of the
 14 average service life estimates. The assets in Account 367.00 are primarily 30-inch coated
 15 steel pipelines. The entire line is cathodically protected and are subject to smart pigging on
 16 a seven-year cycle. It is my understanding that there are no pipe replacement programs
 17 planned for the immediate future.

18 The investment in Transmission Plant – Mains is approximately \$132.8 million,
 19 representing 41.88 percent of the total depreciable plant studied. The retirements, additions,
 20 and other plant transactions for the period 1959 through 2020 were analyzed by the
 21 retirement rate method. Retirements of \$9,882,483 were recorded for the period 2006
 22 through 2020, resulting in actual observed data points as depicted on page 7-10 of my
 23 depreciation report. Peer comparison of American utilities produced a range from fifty-
 24 seven to seventy years. As such, the Iowa 65-R4, with a residual measure of 0.7878, is
 25 recommended for this account based on the fit to historic data, the indications from MGT
 26 management and operations, and the professional judgment of Concentric.

27 The following chart summarizes for each of the transmission accounts the current
 28 average service life I recommend in my study. As discussed in Section 9 of my report, the

1 survivor curves, as noted in the chart below, are comprised of two components: an average
 2 service life estimate and an estimated retirement dispersion pattern. For example, the
 3 currently approved survivor curve for Account 365.20 is indicated as a 60-R2. In this
 4 example, the “60” refers to an estimated 60-year average service life and an estimated
 5 retirement dispersion in accordance with the standardized Iowa R2 curve.

Account	Account Description	Proposed Survivor Curve
	(1)	(3)
365.20	Rights of Way	60-R4
366.10	Compressor Station Structures	50-R3
366.20	Measuring Station Structures	40-R4
366.30	Other Structures	50-R3
367.00	Mains	65-R4
368.00	Compressor Station Equipment	38-R3
368.10	Compressor Station Equipment Overhaul	15-SQ
369.00	Measuring and Regulating Station Equipment	37-R3
369.10	Measuring Station Equipment	37-R3
369.20	Metering Equipment	37-R3
370.00	Communications Equipment	25-R4
371.00	Other Transmission System Equipment	25-R3.5

6

7 **Q. Does this conclude your Direct Testimony?**

8 A. Yes.

Exhibit No. MGT-0016

SECTION 1

1 STUDY HIGHLIGHTS

Pursuant to request of Midwestern Gas Transmission Company (“MGT” or “Company”), Concentric Energy Advisors (“Concentric”), under the supervision and direction of Larry Kennedy, completed a depreciation study related to natural gas Transmission and General Plant accounts. The purpose of the study is to determine the annual depreciation accrual rates and amounts applicable to the original cost of gas utility plant, as of October 31, 2020.

In addition, the study determines the annual accrual rate to recover the future net cost of removal of gas utility plant. Concentric recommends the recovery of future net negative salvage requirements through the use of an independent cost of removal annual accrual rate, which has been determined in addition to the base depreciation rates. This net negative salvage rate will ensure that cost of removal estimates are recovered over the useful life of the assets and eliminate intergenerational inequity. This annual accrual rate does not form any part of the base annual depreciation rate.

The depreciation rates are based on the Straight-Line method using the Average Life Group procedure and were applied on a Remaining Life basis. The calculations were based on attained ages and estimated average service life and forecasted net negative salvage characteristics for each depreciable group of assets. Variances between the calculated accrued depreciation and the book accumulated depreciation, as of October 31, 2020, are amortized over the composite remaining life of each account.

MGT continues to utilize the recovery of future costs of removal over the average service life of the assets. Therefore, this study calculates expenses related to the recovery of original investment in addition to a separate recovery of future cost of removal.

This study incorporates the use of an Economic Planning Horizon (EPH) in calculation of depreciation rates. Based on a review undertaken by Concentric, the depreciation rates within this study have included an EPH of October 31, 2050.

Concentric recommends the calculated annual depreciation accrual rates set forth herein apply specifically to natural gas plant in service, as of October 31, 2020, summarized by Tables 1A, 1B and 1C. Supporting data and calculations are provided within the study.

Finally, this study results in a total annual depreciation expense accrual related to the recovery of original cost and net negative salvage requirement of \$11.4 million, when applied to depreciable plant study balances, as of October 31, 2020, of \$317.1 million. The study results are summarized at an aggregate functional group level as follows:

SUMMARY OF ORIGINAL COST, ACCRUAL PERCENTAGES AND AMOUNTS RELATED TO RECOVERY OF ORIGINAL COST OF INVESTMENT

Plant Group / Accounts	Original Cost	Annual Accrual	Annual Accrual
Transmission Plant	\$306,202,629	\$6,862,384	2.24%
General Plant	\$10,869,386	\$1,331,938	12.25%
TOTAL	\$317,072,015	\$8,194,322	2.58%

SUMMARY OF ORIGINAL COST, ACCRUAL PERCENTAGES AND AMOUNTS RELATED TO COST OF REMOVAL

Plant Group / Accounts	Original Cost	Annual Accrual	Annual Accrual
Transmission Plant	\$306,202,629	\$3,220,303	1.05%
General Plant	\$10,869,386	\$0	0%
TOTAL	\$317,072,015	\$3,220,303	1.02%¹

¹ The annual accrual related to net negative salvage when applied to only assets accruing net negative salvage is 1.13%. The annual accrual related to net negative salvage when applied to all assets in service is 1.02%.

SECTION 2

2 BASIS OF THE STUDY

2.1 Scope

Concentric has been retained by MGT to develop reasonable and appropriate depreciation rates based on plant in service as of October 31, 2020. This report sets forth the results of the study and describes the process and procedures followed by Concentric in the development of the recommended annual depreciation accrual rates for natural gas Transmission and General Plant assets in service as of October 31, 2020. The annual depreciation accruals rates and amounts are based on the straight-line remaining life method of depreciation, incorporating the Average Life Group (“ALG”) procedure applied on a Remaining Life basis.

The Straight-Line method, ALG procedure is a commonly used depreciation calculation procedure that has been widely accepted in jurisdictions throughout North America. Concentric recommends its continued use. Amortization accounting is used for certain accounts because of the disproportionate plant accounting effort required in these accounts. Many regulated utilities in North America have received approval to adopt amortization accounting for these accounts.

2.2 Plan of Study

This study is presented in the following order:

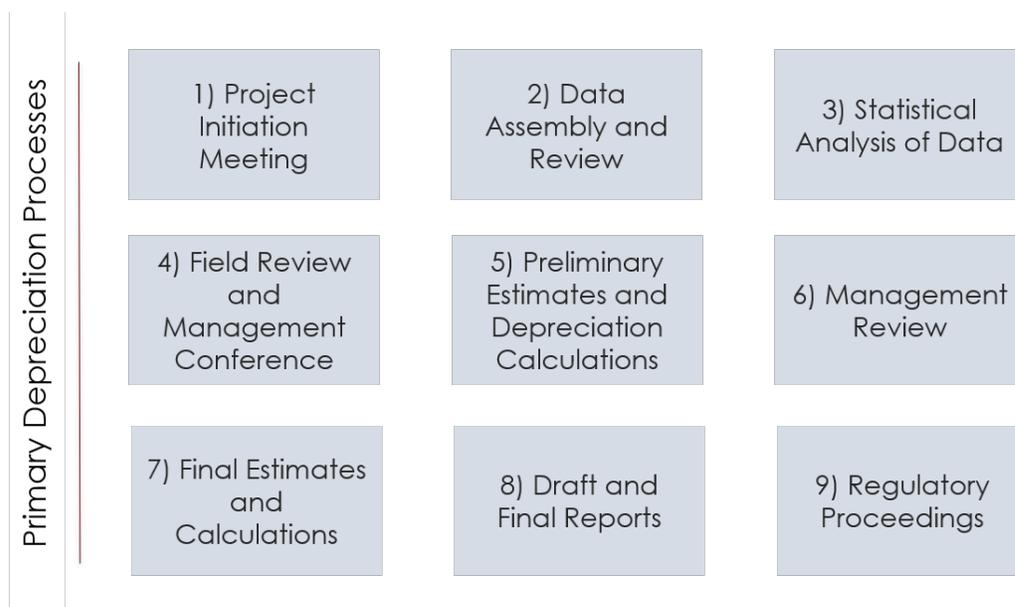

Section 1:	Study Highlights, presents a brief summary of the depreciation study and results
Section 2:	Contains statements with respect to the plan and the basis of the study
Section 3:	Development of the Required Depreciation Rates, presents descriptions of the methods used and factors considered in the service life study
Section 4:	Criteria and Consideration for use in the Development of an Economic Planning Horizon/Truncation Dates/Life Span Dates Summary
Section 5:	Calculation of Annual and Accrued Depreciation, presents the methods and procedures used in the calculation of depreciation
Section 6:	Results of Study, presents summaries by depreciable group of annual and accrued depreciation in Tables 1A and 1B
Section 7:	Presents the results of the Retirement Rate Analysis
Section 8:	Presents the results of the Detailed Depreciation Calculations
Section 9:	Estimation of Survivor Curves, is an overview of Iowa curves and the Retirement Rate Analysis

2.3 Depreciation

A full and comprehensive depreciation study includes the following components:

1. fully justified recommendations regarding Average Service Life estimates for each account;
2. fully justified recommendations regarding estimated Net Salvage requirements for each account;
3. selection of an appropriate grouping procedure;
4. detailed calculation of the depreciation rate utilizing the estimated Average Service Life and Net Salvage requirements; and
5. a document explaining the procedures followed and justifying the results in a format suitable for submission to senior management and regulatory authorities.

A diagram of the nine primary processes followed by Concentric in the development of the depreciation study is provided below. Each of the steps is undertaken by Concentric using proprietary software.

2.4 Information Provided by MGT

MGT has provided Concentric with the required information, as of October 31, 2020, for all accounts being studied. This information has been compiled from the company’s plant accounting records and includes the following:

- current balances by vintage year for each account (aged balances). The balances provide the amount of investment, sorted by installation year, currently in operation. This file is only inclusive of current plant in service and does not include any retirement information; and
- retirement transactions for all accounts. The transactions include information regarding the transaction year of the retirement, the installation year of the asset retired, and the original cost of the asset retired.

2.5 Data Reconciliation

The above data was reviewed and reconciled to Company control schedules to ensure accuracy and reasonableness in use of the calculations developed in this study. These checks include:

- that the surviving investment by account equals (or can be reconciled to) the Company's gross plant in service and accumulated depreciation ledger balances;
- that the surviving investment in each vintage is not negative. In other words, this check confirms that the sum of retirements from any given vintage have not exceeded the amount of plant additions to the vintage; and
- that any adjusting transactions are properly accounted for within the databases.

SECTION 3

3 DEVELOPMENT OF THE REQUIRED DEPRECIATION RATES

3.1 Depreciation

The development of the depreciation calculations requires the input of an Average Service Life, a retirement dispersion curve (i.e. Iowa curve) and Net Salvage recommendations (the “depreciation parameters”). Additionally, to complete the depreciation calculations the calculation methods must be established. Specifically, the selection of the depreciation method must establish three types of additional input:

1. the choice of a depreciation procedure;
2. a basis upon which to apply the method; and
3. in the case of group assets, a procedure to use in grouping the assets.

In this study, the depreciation rates for MGT have been calculated in accordance with the Straight-Line method/ALG procedure and applied using the Remaining Life technique, with any accumulated depreciation variances trued-up over the composite remaining life of each account.

Depreciation, as applied to depreciable gas plant, means the loss in service value not restored by current maintenance, incurred in connection with the consumption or prospective retirement of gas plant in the course of service from causes which are known to be in current operation and against which the utility is not protected by insurance. Among the causes to be given consideration are wear and tear, decay, action of the elements, inadequacy, obsolescence, changes in the art, changes in demand and requirements of public authorities, and, in the case of natural gas companies, the exhaustion of natural resources.²

When considering the action of the elements, the average service life and net negative salvage calculations have considered large catastrophic events that have occurred and impacted the life estimates of utilities across North America. The average service life of utilities has been influenced by events including:

- Statutory and regulatory changes;
- forest fires;
- earthquakes;
- tornadoes;
- ice storms;
- wind storms;
- large scale flooding;
- fires;
- lightning;
- intentional actions of third parties; and
- other forces of nature.

² Federal Energy Regulatory Commission -Part 201- Uniform System of Accounts Prescribed for Natural Gas Companies Subject to the Provisions of the Natural Gas Act Definitions

Depreciation, as used in accounting, is a method of distributing fixed capital costs, plus net salvage, over a time period by allocating annual amounts to expense. Each annual amount of such depreciation expense is part of that year's total cost of providing natural gas utility service. Normally, the time over which the fixed capital cost is allocated to the cost of service is equal to the time over which an item renders service - that is the item's service life. The most prevalent method of allocation is to distribute an equal amount of cost to each year of service life. This method is known as the Straight-Line method of depreciation.

The calculation of annual and accrued depreciation based on the straight-line method requires the estimation of survivor curves and is described in the following sections of this study. The development of the proposed depreciation rates also requires the selection of group depreciation procedures, as discussed below.

3.1.1 Study Depreciation Methods and Procedures

This study calculates the annual and accrued depreciation using the straight-line method and ALG procedure for most accounts. For certain accounts, the annual and accrued depreciation are based on amortization accounting. Both types of calculations were based on original cost, attained ages and estimates of service lives. Variances between the calculated accrued depreciation and the book accumulated depreciation are amortized over the composite remaining life of each account.

3.2 Estimation of Survivor Curves and Net Negative Salvage

3.2.1 Survivor Curves

The use of an average service life for a property group implies that the various units in the group have different lives. Thus, the average life may be obtained by determining the separate lives of each of the units, or by constructing a survivor curve by plotting the number of units which survive at successive ages using the retirement rate method of analysis.

The range of survivor characteristics usually experienced by utility and industrial properties is encompassed by a system of generalized survivor curves known as Iowa type curves. The Iowa curves "*...were sorted into three groups according to whether the mode was to the left, approximately coincident with, or to the right of the average-life ordinate. The curves in each of these three groups were then sub-classified in accordance with the height of the mode, taking also into consideration the distance of the mode to the left or right of the average life.*"³ The Iowa curves are described as L-type (i.e. left-moded), R-type (i.e. right-moded), and S-type (i.e. symmetrical). Further development resulted in the introduction of O-type (i.e. origin-moded curves) where the greatest frequency of retirement occurs at the origin, or immediately after age zero. Individual type curves are further depicted with numerical subscripts which represent the relative heights of the modes of the frequency curves within each family.

The program that is used by Concentric for statistical smooth curve fitting utilizes an internal "goodness-of-fit" criterion which is the Residual Measure. This Residual Measure is based on a least

³ Robley Winfrey, *Statistical Analyses of Industrial Property Retirements*, Bulletin 125 revised (Engineering Research Institute, Iowa State University, 1935) 65

squares solution of the differences between the stub curve (or original data points) and smooth survivor curve which also requires a balancing of the differences above and below the stub curve.

The criterion of goodness-of-fit is the mean square of the differences between the points on the stub and fitted smooth survivor curves. The residual measure, or standard error of estimate, shown in the output format is the square root of this mean square. As such, the lower the Residual Measure, the better the statistical fit between the analyzed Iowa curve and the observed data points. Concentric follows the widely-used practice of fitting Iowa curves up to one percent of the maximum exposures. This standard practice is utilized to minimize the influence of typically small retirements applied to similarly small exposures which may unduly affect the Iowa curve fitting process. However, Concentric will recognize the observed data points beyond the one percent of maximum exposures if it is determined that the additional data is a valid consideration for life recommendation.

A discussion of the general concept of survivor curves and retirement rate method is presented in Section 10.

3.2.2 Survivor Curve and Net Negative Salvage Judgments

The service life estimates used in the depreciation and amortization calculations were based on informed professional judgment which incorporated a review of management's plans, policies and outlook, a general knowledge of the natural gas industry, and comparisons of the service life estimates from our studies of other natural gas companies. The use of survivor curves to reflect the expected dispersion of retirement provides a consistent method of estimating depreciation for natural gas plant. Iowa type survivor curves were used to depict the estimated survivor curves for the plant accounts not subject to amortization accounting.

The procedure for estimating service lives consisted of compiling and analyzing historical data for the plant accounts using widely accepted techniques and forecasting the survivor characteristics for each depreciable group based on interpretations of the historical data analyses and the probable future. This included operational staff interviews. The combination of historical experience and the estimated future retirements yielded estimated survivor curves from which the average service lives were derived.

The resultant rates associated with the recovery of cost of investment and separately, recovery of cost of removal are summarized in Tables 1A and 1B of this study (Section 6). The rates should be reviewed periodically to reflect the changes that result from plant and reserve account activity. A reserve deficiency or surplus will develop if future capital expenditures vary significantly from those anticipated in this study.

The following discussion, addressing accounts which comprise the majority of the investment analyzed, presents an overview of the factors considered by Concentric in the determination of the average service life and net negative salvage estimates. The survivor curve estimates for the remainder of the accounts not discussed in the following sections were based on similar considerations.

ACCOUNT 365.20 – TRANSMISSION PLANT – RIGHTS OF WAY

Investment \$	Investment %	Concentric Recommends Curves	Concentric Recommended Salvage Rate
\$15,494,908	4.89%	60-R4	0%

The investment in Transmission Plant - Rights of Way is approximately \$15.5 million, representing 4.89 percent of the total depreciable plant studied. Minimal retirements have been booked to this account. Peer comparison of American utilities produced a range from 57 to 70 years. Concentric views that an appropriate life for Transmission Rights of Way should be close to or equal to the longest Transmission life account. Account 367.00 Transmission Mains has a recommended average service life of 65 years. As such, the Iowa 60-R4 is recommended for this account based on the professional judgment of Concentric.

No salvage has been recorded to this account and is not expected due to the intangible aspect of land rights. As such zero percent is the net negative salvage recommendation for this account.

ACCOUNT 366.10 – TRANSMISSION PLANT– COMPRESSOR STATION STRUCTURES

Investment \$	Investment %	Concentric Recommends Curves	Concentric Recommended Salvage Rate
\$10,328,901	3.26%	50-R3	0.39%

The assets in Account 366.10 are primarily metal shell buildings with foundations. These buildings have been well maintained and are still in good shape, even though many are reaching the expected end of life. As these buildings are replaced, it is expected that at least some will be retained as storage facilities. As such, it is expected that the life of these buildings are on the longer end of peer utilities.

The investment in Transmission Plant – Compressor Station Structures is approximately \$10.3 million, representing 3.26 percent of the total depreciable plant studied. The retirements, additions and other plant transactions, for the period 1959 through 2020, were analyzed by the retirement rate method. Retirements of \$165,093 were recorded for the period 2006 through 2019, resulting in the actual observed data points as depicted on page 7-9 of this report. Interviews with MGT's operations and management staff have indicated that the Company would not expect a significant change to the observed average service life characteristics based on an operational perspective. A peer comparison of American utilities indicates a life of 45 years. Concentric viewed that the observed life indication combined with the comments from MGT operational and management staff was the most reasonable expectation for the equipment in this account. As such, the Iowa 50-R3 is recommended for this account based on the fit to historic data, the indications from MGT management and operations, the peer comparison of American utilities and the professional judgment of Concentric.

A full description of the concept of net negative salvage and how net negative salvage is calculated can be found in Section 11 of this report. Concentric views that the use of a minimal level of negative salvage is appropriate for this account. As such, Concentric views that net negative salvage accrual

equal to a net negative salvage accrual rate for this account of 0.39 percent would be appropriate at this time.

ACCOUNT 367.00 – TRANSMISSION PLANT – MAINS

Investment \$	Investment %	Concentric Recommends Curves	Concentric Recommended Salvage Rate
\$132,779,593	41.88%	65-R4	0.69%

The assets in Account 367.00 are primarily 30-inch coated steel pipelines. The entire line is cathodically protected. The pipeline began installation in the 1960s and operates as a bi-directional pipeline. Pipelines over 30 inches are subject to smart pigging on a seven year cycle. There are no pipe replacement programs planned for the immediate future.

The investment in Transmission Plant - Mains is approximately \$132.8 million, representing 41.88 percent of the total depreciable plant studied. The retirements, additions and other plant transactions, for the period 1959 through 2020, were analyzed by the retirement rate method. Retirements of \$9,882,483 were recorded for the period 2006 through 2020, resulting in actual observed data points as depicted on page 7-20 of this report. Peer comparison of American utilities produced a range from 57 to 70 years. As such, the Iowa 65-R4, with a residual measure of 0.7878 is recommended for this account based on the fit to historic data, the indications from MGT management and operations, and the professional judgment of Concentric.

Based on historical indications and the comments from the operations and management staff, Concentric views that a ratio of negative 15 percent best represents the net negative salvage expectation for the equipment in this account. This is equal to an annual accrual rate for this account of 0.69 percent.

ACCOUNT 368.00 – TRANSMISSION PLANT – COMPRESSOR STATION EQUIPMENT

Investment \$	Investment %	Concentric Recommends Curves	Concentric Recommended Salvage Rate
\$106,549,923	33.60%	38-R3	1.94%

The assets in Account 368.00 include primarily natural gas driven reciprocating compressors. The units located in the Hartford Station are currently undergoing a replacement program, with the new units being CAT 3600 reciprocating compressors. It is expected that there will be more replacements required in the coming years to phase out turbine units where necessary. The compressing units are generally very well maintained.

The investment in Transmission Plant – Compressor Station Equipment is approximately \$106.5 million representing 33.60 percent of the total depreciable plant studied. The retirements, additions and other plant transactions, for the period 1959 through 2020, were analyzed by the retirement rate method. Retirements of \$4,600,879 were recorded for the period 2006 through 2020, resulting in the actual observed data points as depicted on page 7-24 of this report. Peer comparison of American

utilities produced a range from 30 to 38 years. The Iowa 38-R3, with a residual measure of 3.4037, is recommended for this account based on the indications from management and operations and on the professional judgment of Concentric.

Based on historical indications and the comments from the operations and management staff, Concentric views that the historical average ratio of negative 20 percent is an appropriate net negative salvage expectation for the equipment in this account. This is equal to an annual accrual rate for this account of 1.94 percent.

ACCOUNT 369.00 – TRANSMISSION PLANT – MEASURING AND REGULATING STATION EQUIPMENT

Investment \$	Investment %	Concentric Recommends Curves	Concentric Recommended Salvage Rate
\$33,670,551	10.62%	37-R3	0.36%

The investment in Transmission Plant – Measuring and Regulating Station Equipment is approximately \$33.7 million representing 10.62 percent of the total depreciable plant studied. The retirements, additions and other plant transactions, for the period 1959 through 2020, were analyzed by the retirement rate method. Retirements of \$503,342 were recorded for the period 2006 through 2020, resulting in the actual observed data points as depicted on page 7-28 of this report. Peer comparison of American utilities produced a range from 35 to 40 years. As such, the Iowa 37-R3, is recommended for this account based on the fit to historical data, comments from MGT management and operations and the professional judgment of Concentric.

Based on historical indications and the comments from the operations and management staff, Concentric views that the historical average ratio of negative 7 percent is an appropriate net negative salvage expectation for the equipment in this account. This is equal to an annual accrual rate for this account of 0.36 percent.

OTHER ACCOUNTS

The above analysis provides the consideration relating to over 94 percent of the depreciable plant. Many of the accounts related to the remaining depreciable plant studied, as of October 31, 2020, are subjected to amortization accounting, which is proposed for a number of accounts that represent numerous units of property, but small portions of depreciable gas plant in service.

SECTION 4

4 CRITERIA AND CONSIDERATIONS FOR USE IN THE DEVELOPMENT OF AN ECONOMIC PLANNING HORIZON/TRUNCATION DATES/LIFE SPAN DATES

4.1 Summary

Long life assets such as those in the MGT's transmission system are restricted not only by physical forces of retirement such as wear and tear and physical deterioration, but also, and to a much greater extent, by economic forces of retirement. Generally, physical forces of retirement are less likely to occur than retirement of large portions of the pipeline system due to economic forces. Specifically, the economic exhaustion of natural gas supply, the changing North American marketplace for natural gas, increased amounts of government legislation regarding decarbonization, and the competitive influences for North American natural gas supply and demand have a significant impact on the estimated service life of the MGT transmission system.

The concept referred to with the terms "economic planning horizon" ("EPH"), "economic life", "life span date, or "truncation date" (which have similar meaning within depreciation literature) is one of the parameters used to set appropriate depreciation rates that accurately reflect the annual consumption in service value. Appropriate depreciation rates also help to ensure that both long term generational equity and a reasonable opportunity for the recovery of investment are achievable.

The pipeline system will be subjected to both interim and final retirement activity. Interim or ongoing retirements represent those retirements described by the interim survivor curve, which is commonly referred to as the Iowa curve. Terminal or final retirements represent those retirements described by the truncation of the interim survivor curve at the truncation date (or economic life), which I conclude for MGT to be 2050, as discussed in detail below. Interim retirements include retirements related to replacements that are primarily caused by wear and tear, deterioration, and technological obsolescence, i.e. the replacement of an item of equipment with a newer item with greater functionality. Terminal retirements include retirements related to the final abandonment of major components of the System caused by the economic obsolescence of the system. Such retirements are not expected to occur all at once. Rather, it is anticipated that there will be a relatively restricted period during which these major retirements will occur. In order to readily perform the mathematical calculations of life and remaining life, the timing of the terminal and final retirements is represented by a single point, the economic planning horizon (or life span date).

An EPH is an estimate at a point in time based on the current information and evaluation of the factors described in this evidence. The use of the term "horizon" within my evidence is meant to convey that this date is not a firmly established "end of company" date, but rather a reasonable period over which the pipeline has a reasonable ability to forecast the key considerations. In fact, most large diameter pipelines regulated by either the Federal Energy Regulatory Commission (FERC) or the Canadian Energy Regulator (CER), formerly known as the National Energy Board of Canada (NEB) have included EPH dates since, at least, the early 1980's into the calculation of the depreciation rates.

Additionally, new pipeline systems have also included EPH dates with their initial application for depreciation rates to the Federal Regulators in Canada and the US. In virtually all cases the EPH periods have been determined with the concept of a lookout of the known supply, demand, and contractual considerations over reasonable period. In this manner, the pipeline is providing a reasonable level of assurance of the recovery of invested capital for its equity investors, while at the same time providing cost accountability, or generational equity, to the current and future users of the pipeline system.

FACTORS IN THE DETERMINATION OF EPH

The estimation of the anticipated economic life is based on the consideration of several factors. While some of these considerations can be considered as “Criteria” for the development of an economic life from a theoretical standpoint, it is important to note that all factors affecting economic life should be considered, but not all will influence on every pipeline’s EPH. In some cases, the appropriate EPH date will be developed from the merging of a number of these factors.

Consideration of the following factors is important to determine a pipeline’s proper economic planning horizon:

- availability of, or constriction to, market demand;
- availability of supply to the pipeline;
- consumption of service value;
- engineering based retirement studies;
- competitiveness of the pipeline;
- opportunity for the recovery of the investment;
- projected long term use of the pipeline;
- approved economic planning horizons of peer companies; and
- management discretion.

Based on an application of the above criteria and as discussed in the testimony of Larry E. Kennedy, Concentric used an economic planning horizon of 30 years for the purpose of this study. The depreciation calculations have utilized a truncation date of 2050.

SECTION 5

5 CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION**5.1 Calculation of Annual and Accrued Amortization**

Amortization is the gradual extinguishment of an amount in an account by distributing such amount over a fixed period, over the life of the asset or liability to which it applies, or over the period during which it is anticipated the benefit will be realized. Normally, the distribution of the amount is in equal amounts to each year of the amortization period.

The calculation of annual and accrued amortization requires the selection of an amortization period. The amortization periods used in this report were based on judgment which incorporated a consideration of the period during which the assets will render most of their service, the amortization period and service lives used by other utilities, and the service life estimates previously used for the asset under depreciation accounting.

Amortization accounting is proposed for a number of accounts that represent numerous units of property, but a very small portion of depreciable gas plant in service. The accounts and their amortization periods are as follows:

Account	Title	Amortization Period, Years	Net Salvage Percentage
303.20	Computer Software	5	-
368.10	Compressor Station Equipment Overhauls	15	-
391.10	Office Furniture and Fixtures	15	-
391.20	Data Processing Equipment	10	-
391.30	Office Machines	10	-
391.60	Computer Hardware	5	-
394.00	Tools, Shop, & Garage Equipment	15	-
394.10	Tools	15	-
397.00	Communication Equipment	10	-
397.20	Telephone Equipment	10	-
398.00	Miscellaneous Equipment	20	-

For the purpose of calculating annual amortization amounts, as of October 31, 2020, the book depreciation reserve for each plant account or subaccount is assigned or allocated to vintages. The calculated accrued amortization is equal to the original cost multiplied by the ratio of the vintage's age to its amortization period. The annual amortization amount is determined by dividing the future

amortizations (original cost less allocated book reserve) by the remaining period of amortization for the vintage.

The following accounts have undepreciated assets older than the selected amortization period:

Account	Title	Amortization Period, Years	Net Salvage Percentage
303.20	Computer Software	5	-
391.10	Office Furniture and Fixtures	15	-
391.20	Data Processing Equipment	10	-
391.30	Office Machines	10	-
391.60	Computer Hardware	5	-
394.00	Tools, Shop, & Garage Equipment	15	-
397.00	Communication Equipment	10	-
397.20	Telephone Equipment	10	-
398.00	Miscellaneous Equipment	20	-

These older vintages have been moved to a separate account in order to maintain the correct depreciation rate for the assets younger than the amortization period. The older assets will be amortized over a five-year period. This method ensures that older investment is fully recovered while also ensuring that newer assets are recovered at the proper rate.

SECTION 6

6 RESULTS OF THE STUDY

6.1 Qualification of Results

The calculated annual and accrued depreciation are the principal results of the study. Continued surveillance and periodic revisions are normally required to maintain continued use of appropriate annual depreciation accrual rates. An assumption that accrual rates can remain unchanged over a long period of time implies a disregard for the inherent variability in service lives and salvage, and for the change of the composition of property in service. The annual accrual rates and the accrued depreciation were calculated in accordance with the Straight-line method, using the ALG procedure based on estimates which reflect considerations of current historical evidence and expected future conditions.

6.2 Description of Detailed Tabulations

The following tables provide summaries by account of the original cost of investment, calculated and booked accumulated depreciation amounts, the required amount of annual depreciation expense, the required depreciation rate to be applied against the original cost of the account and the estimated composite remaining life of the surviving plant in service.

The detailed calculations of annual depreciation applicable to depreciable assets, as of October 31, 2020, are presented in account sequence starting in Section 9 – Page 9-2. The tables indicate the estimated average survivor curves used in the calculations. The tables set forth (for each installation year) the original cost, calculated accrued depreciation and the calculated annual accrual.

SECTION 9

9 ESTIMATION OF SURVIVOR CURVES

9.1 Average Service Life

All assets have a service life, which is defined as “the period of time from its installation until it is retired from service”⁴. All account groups of property are made up of various assets with differing service lives and investment values. To calculate a depreciation rate, one must first calculate an average life for all assets in a single account. This can be done by ascertaining the age at retirement for every asset in an account and plotting it as a percentage of the units surviving at each age interval (a “Survivor Curve”). From the average life for each account, remaining lives can then be found which are then used to calculate the annual depreciation accruals and ultimately depreciation rate. A discussion of the general concept of survivor curves is presented and the Iowa type survivor curves are reviewed.

9.2 Survivor Curves

A survivor curve is defined as “a graph of the percent of units remaining in service expressed as a function of age”⁵. To calculate the average life of the group, the remaining life expectancy, the probable life and the frequency curve, one must first create a survivor curve. Figure 1 shows a typical 40-R4 smoothed survivor curve as well as the accompanying derived curves. The type 40-R4 refers to the Iowa type curve, whose designation will be explained in further detail in the next section

To calculate the average service life, one must calculate the area under the survivor curve and divide by the percent surviving at age zero. The remaining life is equal to the area under the survivor curve and to the right of the current age, divided by the percent surviving at the current age. In Figure 1, for example, the hatched area to the right of age 45 divided by 28.9 percent surviving balance represents the remaining life for an asset that has reached that age. The probable life is “the total life expectancy of the property surviving at any age and is equal to the remaining life plus the current age.”⁶ If the probable life of the property is calculated for each year of age, the probable life curve shown in the chart can be developed. The frequency curve is calculated by taking the difference between the percent surviving on successive years on the survivor curve⁷. Alternatively, frequency can be empirically determined by finding the amount of retirements at any given age. Plotting retirement frequency from the youngest to oldest ages and then taking the cumulative frequencies will generate percent surviving versus age.

FIGURE 1: TYPICAL SURVIVOR CURVE (40-R4) AND DERIVED CURVES

9.3 Iowa Type Curves

In 1931, Robley Winfrey and Edwin Kurtz of the Engineering Research Institute at Iowa State University published Bulletin 103, which laid the groundwork for what would eventually be known as the Iowa Curves. “The 13 type curves can be used as valuable aids in forecasting the probable future service lives of individual items and of groups of items of different kinds of physical equipment”⁸. The 13 curves described in Bulletin 103 eventually became a series of 22 generalized survivor curves which are used throughout the regulated utility industry. These 22 curves were described in Bulletin 125, published in 1967 by Harold A. Cowles, which became known as the Iowa curves.

The Iowa curves are organized with three variables: the average life of the plant; the location of the mode; and the variation of the life. All Iowa curves have both a letter and a number to represent the shape and height of the mode. The L curves, or left-moded curves, are used when the mode of the curve should be to the left of the average life. There are six L curves presented in Figure 2. The R curves, or right-moded, are used when the mode of the curve should be to the right of the average life. There are five R curves, which are presented in Figure 3. The S curves, or symmetrically-moded, are used when the mode is equal to the average life. There are seven S curves, which are presented in Figure 4. The O curves, or origin curves, are used when the mode occurs at age 0. There are four O curves, which are presented in Figure 5. There are some occasions where it is appropriate to use a half curve. In these cases, the curve is assumed to be exactly half way between the two curves.

In addition to Bulletin 125, Iowa curves have also been presented in subsequent Experiment Station bulletins and in the text *Engineering Valuation and Depreciation*⁹. In 1957, Frank V. B. Couch, Jr., an Iowa State College graduate student, submitted a thesis¹⁰ presenting his development of the fourth family consisting of the four O-type survivor curves.

9.4 Retirement Rate Method of Analysis

The retirement rate method is a widely accepted actuarial method used to create survivor curves. This method is also referred to as an original life table. These survivor curves can then be used to determine the average service life of a plant account. The retirement rate method is thoroughly explained in several publications, including Statistical Analyses of Industrial Property Retirements,¹¹ Engineering Valuation and Depreciation¹² and Depreciation Systems.¹³

The retirement rate method is a subgroup of the placement and the experience band methods, as described in “Depreciation Systems”. The placement band method creates a survivor curve which describes the life characteristics of assets placed into service during a selected timeframe. The experience band method creates a survivor curve which describes the life characteristics of assets removed from service during a selected time frame. The retirement rate method creates both placement and experience bands to give the most complete or representative data. An example of the calculations used in the development of a life table follows. The example includes schedules of annual aged property transactions, a schedule of plant exposed to retirement, a life table and illustrations of smoothing the stub survivor curve.

9.5 Schedules of Annual Transactions in Plant Records

The property group used to illustrate the retirement rate method is observed for the experience band 2008-2017 during which there were placements during the years 2003-2017. In order to illustrate the summation of the aged data by age interval, the data was compiled in the manner presented in Schedules 1 and 2. In Schedule 1 (page 9-10), the year of installation (year placed) and the year of retirement are shown. The age interval during which a retirement occurred is determined from this information. In the example which follows, \$10,000 of the asset invested in 2003 were retired in 2008. The \$10,000 retirement occurred during the age interval between 4 ½ and 5 ½ years (2008 - 2003) on the basis that approximately one-half of the amount of property was installed prior to and after July 1 of each year. That is, on the average, property installed during a year is placed in service at the midpoint of the year for the purpose of the analysis. All retirements also are stated as occurring at the midpoint of a one-year age interval of time, except the first age interval which encompasses only one-half year.

The total retirements occurring in each age interval in a band are determined by summing the amounts for each transaction year-installation year combination for that age interval. For example, the total of \$143,000 retired for age interval 4½-5½ is the sum of the retirements entered on Schedule 1 immediately above the stair step line drawn on the table beginning with the 2008 retirements of 2003 installations and ending with the 2016 retirements of the 2011 installations. Thus, the total amount of \$143,000 for age interval 4½-5½ equals the sum of:

$$\$10 + \$12 + \$13 + \$11 + \$13 + \$13 + \$15 + \$17 + \$19 + \$20 = \$143 \text{ k}$$

¹¹ Anson, Winfrey & Hempstead, supra note 8

¹² Anson, Winfrey & Hempstead, supra note 8

¹³ Wolf & Fitch, supra note 3

Other transactions which affect the group are recorded in a similar manner in Schedule 2 (page 9-11). The entries illustrated include transfers and sales. The entries which are credits to the plant account are shown in parentheses. The items recorded on this schedule are not totaled with the retirements but are used in developing the exposures at the beginning of each age interval.

9.6 Schedule of Plant Exposed to Retirement

The development of the amount of plant exposed to retirement at the beginning of each age interval is illustrated in Schedule 3 (page 9-13). The surviving plant at the beginning of each year from 2007 through 2016 is recorded by year in the portion of the table titled "Annual Survivors at the Beginning of the Year." The last amount entered in each column is the amount of new plant added to the group during the year. The amounts entered in Schedule 3 for each successive year following the beginning balance or addition, are obtained by adding or subtracting the net entries shown on Schedules 1 and 2. For the purpose of determining the plant exposed to retirement, transfers-in are considered as being exposed to retirement in this group at the beginning of the year in which they occurred, and the sales and transfers-out are considered to be removed from the plant exposed to retirement at the beginning of the following year. Thus, the amounts of plant shown at the beginning of each year are the amounts of plant from each placement year considered to be exposed to retirement at the beginning of each successive transaction year. For example, the exposures for the installation year 2013 are calculated in the following manner:

Exposures at age 0	=	amount of addition	=	\$750,000
Exposures at age ½	=	\$750,000 - \$ 8,000	=	\$742,000
Exposures at age 1½	=	\$742,000 - \$18,000	=	\$724,000
Exposures at age 2½	=	\$724,000 - \$20,000 - \$19,000	=	\$685,000
Exposures at age 3½	=	\$685,000 - \$22,000	=	\$663,000

For the entire experience band 2008-2018, the total exposures at the beginning of an age interval are obtained by summing diagonally in a manner similar to the summing of the retirements during an age interval (Schedule 1). For example, the figure of 3,789, shown as the total exposures at the beginning of age interval 4½-5½, is obtained by summing:

$$\$255 + \$268 + \$ 284 + \$311 + \$334 + \$374 + \$405 + \$448 + \$501 + \$609 = \$3,789k$$

9.7 Original Life Tables

The original life table, illustrated in Schedule 4 (page 9-15) is developed from the totals shown on the schedules of retirements and exposures, Schedules 1 and 3, respectively. The exposures at the beginning of the age interval are obtained from the corresponding age interval of the exposure schedule, and the retirements during the age interval are obtained from the corresponding age interval of the retirement schedule. The retirement ratio is the result of dividing the retirements during the age interval by the exposures at the beginning of the age interval. The percent surviving at the beginning of each age interval is derived from survivor ratios, each of which equals one minus the retirement ratio. The percent surviving is developed by starting with 100 percent at age zero and successively multiplying the percent surviving at the beginning of each interval by the survivor ratio, i.e., one minus the retirement ratio for that age interval. The calculations necessary to determine the percent surviving at age 5½ are as follows:

Percent surviving at age 4½	=	88.15		
Exposures at age 4½	=	\$3,789,000		
Retirements from age 4½ to 5½	=	\$143,000		
Retirement Ratio	=	$\$143,000 \div \$3,789,000$	=	0.0377
Survivor Ratio	=	$1.000 - 0.0377$	=	0.9623
Percent surviving at age 5½	=	$(88.15) \times (0.9623)$	=	84.83

The totals of the exposures and retirements (columns 2 and 3) are shown for the purpose of checking with the respective totals in Schedules 1 and 3. The ratio of the total retirements to the total exposures, other than for each age interval, is meaningless. The original survivor curve is plotted from the original life table (column 6, Schedule 4). When the curve terminates at a percent surviving greater than zero, it is called a stub survivor curve. Survivor curves developed from retirement rate studies generally are stub curves.

SCHEDULE 4: ORIGINAL LIFE TABLE - CALCULATED BY THE RETIREMENT RATE METHOD

Experience Band 2008-2017			Placement Band 2003-2017		
Age at Beginning of Interval	Exposures at Beginning of Age Interval	Retirements During Age Interval	Retirement Ratio	Survivor Ratio	% Surviving at Beginning of Age Interval
0	7,490	80	0.0107	0.9893	100.00
0.5	6,579	153	0.0233	0.9767	98.93

13.5	167	26	0.1557	0.8443	42.24
					35.66
Total	44,780	1,606			

- Exposure and Retirement Amounts are in Thousands of Dollars
- Column 2 from Schedule 3, Column 12, Plant Exposed to Retirement.
- Column 3 from Schedule 1, Column 12, Retirements for Each Year.
- Column 4 = Column 3 divided by Column 2.
- Column 5 = 1.0000 minus Column 4.
- Column 6 = Column 5 multiplied by Column 6 as of the Preceding Age Interval.

9.8 Smoothing the Original Survivor Curve

The smoothing of the original survivor curve eliminates any irregularities and serves as the basis for the preliminary extrapolation to zero percent surviving of the original stub curve. Even if the original survivor curve is complete from 100 percent to zero percent, it is desirable to eliminate any irregularities, as there is still an extrapolation for the vintages which have not yet lived to the age at which the curve reaches zero percent. In this study, the smoothing of the original curve with established type curves was used to eliminate irregularities in the original curve.

The Iowa type curves are used in this study to smooth those original stub curves which are expressed as percentages surviving at ages in years. Each original survivor curve was compared to the Iowa curves using visual and mathematical matching in order to determine the better fitting smooth curves. In Figures 6, 7, and 8, the original curve developed in Schedule 4 is compared with the L, S, and R Iowa type curves which most nearly fit the original survivor curve. In Figure 6, the L1 curve with an average life between 12 and 13 years appears to be the best fit. In Figure 7, the S0 type curve with a 12-year average life appears to be the best fit and appears to be better than the L1 fitting. In Figure 8, the R1 type curve with a 12-year average life appears to be the best fit and appears to be better than either the L1 or the S0.

In Figure 9, the three fittings, 12-L1, 12-S0 and 12-R1 are drawn for comparison purposes. It is probable that the 12-R1 Iowa curve would be selected as the most representative of the plotted survivor characteristics of the group.

Notes:

- Proposed Accrual Amount calculated by dividing Future Accruals by Composite Remaining Life.
- Proposed Depreciation Rate calculated by dividing Proposed Accrual Amount by Gross Plant unless otherwise noted.
- Composite Remaining Life stipulated as determined in the applicable Facilities Surcharge project. Please refer to Table 1 on Page 3 of this filing.
- Depreciation Rate stipulated as determined in the applicable Facilities Surcharge project. Please refer to Table 1 on Page 3 of this filing.
- The following Facilities Surcharge projects are not included as they have either been fully recovered or have no capital component: Projects 2, 4, 9, 10, 11, 21 – Legacy Line 14 and 21 – Line 14 Additions (Legacy).
- Project 5 - Southern Access Mainline Expansion Project has a stipulated depreciation rate of 3.33% pursuant to the terms of the Southern Access Mainline Expansion Project agreement (FERC Docket No. OR06-3-000, at Page 9).

Attention: Michael Hrynchyshyn
Director, Regulatory Strategy and Compliance

Dear: Mr. Hrynchyshyn

Pursuant to your request, we have conducted a technical update to the previous depreciation study completed in October 2016 by Gannett Fleming Valuation and Rate Consultants, LLC. The calculated annual depreciation accrual rates presented in this 2021 update are related to the actual plant in service as of December 31, 2020. The depreciation rates are based on the straight-line, average life group procedure, applied on a remaining life basis.

We gratefully acknowledge the assistance of Enbridge personnel in the completion of this update.

Should you have any questions or concerns, please do not hesitate to contact me directly at 587-997-6489

Yours truly,

CONCENTRIC ADVISORS, ULC

SECTION 1

1 STUDY HIGHLIGHTS

Pursuant to a request from Enbridge Energy, Limited Partnership (“Enbridge” or the “Company”), Concentric Energy Advisors (“Concentric”) completed a Technical Update (“the Update”) to the results of the depreciation study filed by Enbridge in October 2016. The results of the Update contained herein relate to the oil transmission assets as of December 31, 2020. The purpose of the update is to determine the annual depreciation accrual rates and amounts for ratemaking purposes applicable to the original cost of plant as of December 31, 2020.

The depreciation rates in this update have been calculated using the same depreciation methods, procedures and techniques employed in the last Enbridge depreciation study.

Additionally, the depreciation rate calculations are based on the average service life and retirement dispersion estimates developed in the last full depreciation study. However, in this technical update, Enbridge Energy has proposed a December 31, 2040 truncation date. Concentric has reviewed the appropriateness of this truncation date for the purpose of calculating depreciation rates for its pipeline assets as of December 31, 2020 and find it appropriate at this time.

SECTION 2

2 BASIS OF THE UPDATE

2.1 Scope

Concentric has been retained to develop a technical update to the depreciation study completed in 2016 for Enbridge. The purpose of the Update was to determine the annual depreciation accrual rates and amounts for ratemaking purposes applicable to the actual surviving original cost as of December 31, 2020 based on an updated estimate of the composite remaining lives for property account. The depreciation accrual rates presented herein are based on generally-accepted methods and procedures for calculating depreciation.

The annual depreciation accrual rates and amounts are based on the broad group straight line method of depreciation using the Average Life Group (“ALG”) procedure and were applied using the remaining life technique. The calculations were based on the actual plant accounting ledger values as of December 31, 2020. Inherent in the application of the depreciation parameters with the remaining life technique, the accumulated depreciation accounts are trued up of any variances between the actual book accumulated depreciation reserve and calculated accrued depreciation requirement are amortized over the composite remaining life of each group of assets.

2.1.1 Purpose of a Technical Update

Concentric notes that the depreciation rates should be reviewed periodically as plant and accumulated depreciation account activity may result in materially different depreciation rates. The survivor curves and amortization periods determined in the Company’s most recent full depreciation study should be the basis for the periodic recalculations. Complete depreciation studies, which re-evaluate these parameters, should be performed periodically.

When depreciation rates are calculated utilizing a remaining life technique, the depreciation rate is established by dividing the undepreciated value of each group of assets (after consideration to the net salvage requirements) by the composite remaining life of the group of assets. This calculation is made for each vintage surviving investment as of the date of the study (or Update), and then composited into a calculation for the account or group as a whole. As follows, this calculation requires two estimates:

- The actual booked accumulated depreciation for each vintage within each account. Enbridge does not track the booked accumulated depreciation reserve by vintage within each account. The depreciation expense is calculated at an account level and booked to accumulated depreciation at the same account level. Concentric notes that this is the practice employed by virtually all regulated utilities and is a continuation of the practice used in the 2016 depreciation study. As such, the accumulated depreciation by account, is allocated within the account, to each vintage on the basis of the calculated accumulated by vintage. The calculated accumulated depreciation is a function of the estimated survivor curve, the average service life estimate, the truncation date and the achieved age of each vintage.

- The estimated remaining life of each vintage with each account. The estimated remaining life of each account is a direct function of the achieved age of each vintage, the estimated survivor curve and the average service life estimate, and the truncation date.

Once the above two estimates are determined (the allocated booked reserve by vintage and the average remaining life of each vintage) an annual accrual requirement for each vintage is determined by dividing the net book value for each vintage (considering the estimated future salvage requirements) by the average remaining life of the vintage. The annual requirement for each vintage is summed at the account level and divided into the sum of the accounts original cost surviving as of the study date to determine a required remaining life depreciation accrual rate for the account.

The calculations as described above are dependent upon the actual total account book depreciation and the estimated remaining life of each vintage. The depreciation rate can vary year over year due to plant addition and retirement activity. Additionally, the age of retirements in any given year can cause a required adjustment to the depreciation rate going forward, resulting in the need for this technical update.

2.2 Information Provided by Enbridge

Enbridge has provided Concentric with the required information as of December 31, 2020 for all accounts being studied in this Update. The information includes the following:

- current balances by vintage year for each account (aged balances). The balances provide the amount of investment sorted by installation year currently in operation. The actual 2020 transaction plant accounting data was forwarded directly from Enbridge to Concentric so that the 2016 files could be updated through December 31, 2020;
- the actual booked accumulated depreciation amounts by account as of December 31, 2020 were forwarded directly from Enbridge to Concentric; and
- the last full depreciation study was provided to Concentric to use in the determination of prior depreciation practices and approved depreciation parameters.

2.3 Data Reconciliation

The above data was reviewed and reconciled to Company control schedules to ensure accuracy and reasonableness in use of the calculations developed in this Update. These checks include:

- that the surviving investment by account equals (or can be reconciled to) the Company's gross plant in service and accumulated depreciation ledger balances; and
- that the surviving investment in each vintage is not negative. In other words, this check confirms that the sum of retirements from any given vintage have not exceeded the amount of plant additions to the vintage.

SECTION 3

3 DEVELOPMENT OF THE REQUIRED DEPRECIATION RATES

3.1 Depreciation

The development of the depreciation calculations requires the input of an Average Service Life, Iowa curve and a Truncation Date (otherwise referred to as Economic Life, Economic Planning Horizon, or Life Spans dates) (the “depreciation parameters”). Additionally, to complete the depreciation calculations, the calculation methods must be established. Specifically, the selection of the depreciation method must establish three types of additional input:

- the choice of a depreciation method;
- a basis upon which to apply the method, and
- in the case of group assets, a procedure to use in grouping the assets.

In this Update, the depreciation rates for Enbridge have been calculated in accordance with the Straight-Line method, the Average Life Group procedure and applied using the Remaining Life technique.

Depreciation in public utility regulation, is the loss in service value not restored by current maintenance, incurred with the consumption or prospective retirement of utility plant in service from causes which are known to be in current operation and against which the utility is not protected by insurance. Among causes to be given consideration are: wear and tear; deterioration; action of the elements; inadequacy; obsolescence; changes in the art; changes in demand; and the requirements of public authorities. When considering the action of the elements, the average service life calculations have considered large catastrophic events that have occurred and impacted the life estimates of utilities across North America. The average service life of utilities has been influenced by events including forest fires, earthquakes, tornadoes, ice storms, windstorms, large scale flooding, fires, intentional actions of third parties and other natural forces of nature.

Depreciation, as used in accounting, is a method of distributing fixed capital costs less net salvage over a period of time by allocating annual amounts to expense. Each annual amount of such depreciation expense is part of that year's total cost of providing oil utility service. Normally, the time over which the fixed capital cost is allocated to the cost of service, is equal to the time over which an item renders service, that is the item's service life. The most prevalent method of allocation is to distribute an equal amount of cost to each year of service life. This method is known as the Straight-Line method of depreciation.

This update uses the average service life and Iowa curve dispersion estimates as approved in the last full Enbridge depreciation study. Imbedded in the remaining life calculations, the variances between the calculated accrued depreciation and the book accumulated depreciation are amortized over the composite remaining life of each account.

The review of the truncation date used in the calculations is discussed in the sections below.

3.2 Truncation Date

Long life assets such as those in the Lakeheads's transmission system are impacted not only by physical forces of retirement such as wear and tear and physical deterioration, but also, and to a much greater extent, by economic forces of retirement. Generally, physical forces of retirement are less likely to occur than the retirement of large portions of the pipeline system due to economic forces. Specifically, the economic exhaustion of crude oil supply, the changing North American marketplace for fossil fuels, and the competitive influences in the Western Canada Sedimentary Basin have a significant impact on the estimated service lives of the Lakehead transmission system. As such, Concentric recommended that the company undertake an internal review of the long-term crude oil supply and demand factors to ensure that the remaining life calculations will be based on the most current estimate of these economic factors.

Long life assets, such as crude oil pipelines, are subject to a number of different forces of economic retirement, including increased competition, changes in either supply or market conditions or other factors that can cause a change in utilization of a pipeline system. The concept referred to with the terms "economic life" or "economic planning horizon" or "truncation date" (which have similar meaning within depreciation literature) is the key parameter used to set appropriate depreciation rates that accurately reflect the annual consumption in service value. Appropriate depreciation rates also help to ensure that both long term generational equity and a reasonable opportunity for the recovery of investment are achievable.

Ultimately the risk of recovery of a pipeline's investment which is its fundamental risk, rests with the pipeline company to manage through such tools as depreciation studies and capitalization policy. Moreover, this fundamental risk is asymmetric. If, in the fullness of time, Enbridge's truncation date turns out to be too short shippers ultimately benefit through a lower future rate base and rates. On the other hand, should the truncation date have been set too long then the pipeline may be unable to charge rates to allow it to recover its remaining investment. Concentric notes that pipelines should be afforded a degree of latitude to manage this risk through the tools at their disposal.

Concentric has reviewed the Enbridge analysis of Crude Oil Supply, Canadian Specific Supply, and the Crude Oil Demand Outlook, which has incorporated both Canadian and United States Demand. Concentric notes the factors considered are all relevant and consistent with the analysis that is required for the determination of a truncation date to use in the development of depreciation rates for a regulated pipeline system.

The December 31, 2040 truncation date is incorporated in the estimated survivor characteristics by truncating the survivor curve which represents the physical life of the facilities in all accounts at the attained age of each vintage as of the truncation date.

SECTION 4

4 RESULTS OF UPDATE

4.1 Qualification of Results

The calculated annual and accrued depreciation are the principal results of the update. Continued surveillance and periodic revisions are normally required to maintain continued use of appropriate annual depreciation accrual rates. An assumption that accrual rates can remain unchanged over a long period of time implies a disregard for the inherent variability in service lives, and for the change of the composition of property in service. The annual accrual rates and the accrued depreciation were calculated in accordance with the Straight-line method, using the ALG procedure based on estimates which reflect considerations of current historical evidence and expected future conditions.

4.2 Description of Detailed Tabulations

The following tables provide summaries by account of the original cost of investment, calculated and booked accumulated depreciation amounts, the required amount of annual depreciation expense, the required depreciation rate to be applied against the original cost of the account and the estimated composite remaining life of the surviving plant in service.

The detailed calculations of annual depreciation applicable to depreciable assets, as of December 31, 2020, are presented in account sequence starting in Section 5. The tables indicate the estimated average survivor curves used in the calculations. The tables set forth (for each installation year) the original cost, calculated accrued depreciation and the calculated annual accrual.

Docket No. RP15-1022-000 *et al.*

**PREPARED DIRECT TESTIMONY OF
BRIAN TROICUK
ON BEHALF OF ALLIANCE PIPELINE L.P.**

SUMMARY OF PREPARED DIRECT TESTIMONY OF BRIAN TROICUK

Mr. Troicuk is the Director, Regulatory Affairs at Alliance Pipeline L.P. (“Alliance”). Mr. Troicuk will be testifying regarding the requirement set forth in the Federal Energy Regulatory Commission’s (“Commission” or “FERC”) November 19, 2015 Order on Rehearing, in which the Commission stated that in its June 30, 2015 Order, the mention of certain issues for examination at hearing was not intended to foreclose examination of other aspects of Alliance’s May 29, 2015 filing at hearing, including all issues related to Alliance’s proposed tariff changes.

PREPARED DIRECT TESTIMONY OF BRIAN TROICUK

1 **I. Introduction**

2 **Q. Please state your name, title and business address.**

3 A. My name is Brian Troicuk. My business address is Alliance Pipeline Ltd., 800, 605 – 5th
4 Avenue S.W., Calgary, Alberta T2P 3H5, Canada. I am the Director, Regulatory Affairs
5 for Alliance Pipeline Ltd., on behalf of Alliance Pipeline Inc., Managing General Partner
6 of Alliance Pipeline L.P.

7 **Q. Please briefly describe your education, and professional experience and**
8 **qualifications.**

9 A. I graduated from Carleton University in Ottawa with a Bachelor of Engineering
10 (Mechanical) degree. In addition, I graduated from the University of Ottawa with a
11 Master of Business Administration degree. I am a member of the Association of
12 Professional Engineers and Geoscientists of Alberta. I have been employed by Alliance
13 Pipeline since 2008.

14 **Q. Have you previously testified before the Federal Energy Regulatory Commission**
15 **(“Commission” or “FERC”)?**

16 A. Yes, on December 1, 2015 I submitted testimony in these proceedings.

17 **Q. What is the purpose of this direct testimony?**

18 A. The purpose of this direct testimony in this proceeding is to address the statement in the
19 Commission’s November 19, 2015 Order on Rehearing that the Commission’s prior order
20 of June 30, 2015 was not intended to foreclose examination of other aspects of Alliance’s
21 May 29, 2015 filing at hearing, including all issues related to Alliance’s proposed tariff
22 changes.

1 **Q. Will you address all of Alliance’s May 29, 2015 proposed tariff changes?**

2 A. No. I will not address those changes which were purely housekeeping in nature. I also
3 want to point out that the Commission accepted several of the proposed tariff changes
4 which were contested in this proceeding, as well as others which were uncontested or
5 which the Commission found to be consistent with existing policy or otherwise just and
6 reasonable. For example, FERC found in its November 19, 2015 Order on Rehearing at
7 P 56 that Alliance’s proposal to modify sections 12, 13, and 15 of its General Terms and
8 Conditions (“GT&C”) to remove the scheduling and curtailment priority for AOS service
9 over other interruptible service is consistent with Commission policy and just and
10 reasonable. The Commission also found that Alliance’s proposed modification to GT&C
11 section 39.1, which provides that a shipper and Alliance may agree to a negotiated rate
12 less than the minimum recourse rate, is not unjust or unreasonable as far as it goes.
13 However, if such a rate is negotiated, parties will have the right to object that the rate is
14 unjust and unreasonable. Should Alliance file a negotiated rate with a rate less than the
15 minimum rate, any party is free to protest the filing, and raise arguments that the rates are
16 discriminatory or that the rates may otherwise unreasonably harm other shippers. The
17 Commission approved this proposal in its June 30, 2015 Order at P 48, and subsequently
18 clarified it in its November 19, 2015 Order on Rehearing at P 69.

19 **Q. Please address Section 22 of the GT&C.**

20 A. Alliance’s filing proposed to require that shippers provide audited consolidated financial
21 statements, unaudited consolidated financial statements, and any additional information
22 regarding the business affairs, operations, assets, and financial condition of shippers that
23 Alliance reasonably required from time to time. In its June 30, 2015 Order at P 47, the

1 Commission approved this proposal and subsequently clarified in its November 19, 2015
 2 Order on Rehearing at P 70 that a lack of audited and unaudited consolidated financial
 3 statements is not of itself automatic grounds for a determination of non-creditworthiness,
 4 but rather that Alliance has the right to require additional information and adequate data
 5 to make such determinations. The Commission noted that if a shipper could offer
 6 alternative satisfactory documentation to that requested by Alliance, the shipper should
 7 be permitted to do so.

8 **Q. Please address the removal of Section 34 from the GT&C.**

9 A. A key element in Alliance’s May 29, 2015 filing was the removal of the AOS and IT
 10 revenue crediting provisions from the tariff, reflecting both the termination by legacy
 11 shippers of the original cost-based service framework and Alliance’s status as an “at-risk”
 12 pipeline effective December 1, 2015. The removal of the existing GT&C Section 34
 13 requirement to credit all IT revenues to firm shippers is plainly necessary to allow
 14 Alliance a reasonable opportunity to recover its costs in the post-December 1, 2015 era.
 15 Alliance requires IT revenues to support cost recovery, and has accordingly requested a
 16 waiver of the Commission’s policy to either allocate costs to or credit revenues from all
 17 services provided by a pipeline. That issue is part of the hearing in this case and
 18 Alliance’s September 14, 2015 cost and revenue study fully justifies Alliance’s existing
 19 rates and allocates costs to non-firm services.

20 **Q. Please address Section 20.1 of the GT&C.**

21 A. Intervenor Badlands NGL’s, LLC expressed concerns about the identification of Aux
 22 Sable Liquids Products LP (“ASLP”) as the sole processor of gas in Section 20.1 of the

1 GT&C. , Alliance proposes to revise Section 20.1 to remove the reference to ASLP and
2 replace it with “processor”.

3 **Q. Please address other changes to the Statement of Rates, Rate Schedules, GT&C, and**
4 **Forms of Agreements.**

5 A. In addition to the items described above, Alliance proposed to implement changes to
6 other existing tariff provisions, as summarized below, as well as certain housekeeping
7 modifications and clarifications of NAESB standards. No changes were proposed to the
8 maximum and minimum recourse rates on Sheet No. 10. The footnotes on Sheet No. 10
9 were revised to reflect the applicability of the Fuel Requirement in revised GT&C
10 Section 14. The recourse rates for NomPAL service have been removed from Sheet No.
11 10A, reflecting the elimination of the NomPAL service option, as described below.

12 **Q. Please discuss other applicable changes.**

13 A. Alliance also proposed revisions to Rate Schedule FT-1, Section 2.5, Section 4 and
14 Section 7. Section 2.5, in Second Revised Sheet No. 81, has been revised to authorize
15 shippers to request the “staging” of their contracted capacity in periodic tranche
16 commitments, provided that (1) the term weighted average aggregate Contracted
17 Capacity is at least 50 MMcf/d and (2) the initial term of the Firm Transportation
18 Agreement is at least 5 years. The *pro forma* Rate Schedule FT-1 service agreement has
19 also been revised. The Commission’s June 30, 2015 Order accepted this change.

20 **Q. Please discuss revisions to Section 4 of the GT&C, regarding Primary Delivery**
21 **Point Capacity.**

22 A. A firm shipper’s right to Primary Delivery Point Capacity equal to 150% of Contracted
23 Capacity (included in the original Alliance tariff to accommodate AOS quantities) has

1 been revised in Section 4 so that Primary Delivery Point Capacity matches Contracted
2 Capacity. In addition, the process for a shipper to make changes to its primary receipt
3 and delivery point designation and capacities has been clarified and streamlined.

4 **Q. Please discuss changes to Reservation Charge Credits.**

5 A. In Second Revised Sheet No. 85, Section 7 of Rate Schedule FT-1 (Reservation Charge
6 Credits, or “RCCs”) has been revised. Proposed Section 7.1(a), on First Revised Sheet
7 No. 85, requires Alliance to grant RCCs if its physical capacity to transport gas is
8 reduced, the reduction prevents Alliance from transporting the shipper’s gas in
9 accordance with their Firm Transportation Agreement, and the shipper chooses not to
10 mitigate the reduction through commercial or other means available on Alliance’s
11 system. In such circumstances, Alliance would be required to give full credits when the
12 outage is due to an event within its control (a non-*force majeure* event) and partial credits
13 when the outage is due to a *force majeure* event, using the Safe Harbor Method approved
14 by the Commission. Revised Section 7.1(b) provides that shippers who nominate service
15 from secondary receipt points are not entitled to receive RCCs. Revised Section 7.1(c)
16 provides that a shipper will only be entitled to receive RCCs for capacity that, if it had
17 been nominated and tendered at the shipper’s contracted receipt point, the pipeline would
18 have been able to schedule the gas for transport in accordance with Section 12 of the
19 GT&C. Revised Section 7.1(d) would preclude a shipper from receiving RCCs if the
20 shipper’s gas does not comply with the Quality of Gas Specifications in Section 2 of the
21 GT&C or exceeds the volumes that Alliance is required to transport under the Firm
22 Transportation Agreement. These changes were approved in P 43 of the June 30, 2015
23 Order.

1 **Q. Please discuss revisions to the rate schedule for Park and Loan service.**

2 A. In the Rate Schedule for Park and Loan (“PAL”) service, the NomPAL service option has
3 been eliminated due to lack of demand. No shipper has ever requested the use of
4 NomPAL. Shippers have consistently utilized the TermPAL and AutoPAL service
5 options to meet their park and loan service requirements. In addition, consistent with the
6 assumption of responsibility by Alliance for managing its operational linepack, in the rare
7 instance that a shipper fails to remove any parked quantity it will become part of
8 Alliance’s operational line pack. This change was approved in P 48 of the June 30, 2015
9 Order.

10 **Q. Please address other GT&C changes.**

11 A. In Section 1 (Definitions), on Sheet Nos. 200-207, revisions were made to the list of
12 Definitions in order to modify existing terms to encompass the changes necessary to
13 reflect the new Alliance business model.

14 In a filing dated December 9, 2015, in Docket No. RP16-292-000, Alliance made
15 additional revisions to the AOS-related provisions, but the Commission has not yet acted
16 on that filing, as of the date of this testimony.

17 In Section 2 (Quality of Gas), Alliance modified certain gas quality provisions of
18 the tariff to align with industry standards and changed the hydrocarbon dewpoint
19 specification from 14°F to 23°F. The Commission accepted this subject to the filing of
20 additional information by Alliance, which the Commission, by letter order issued August
21 7, 2015, found that such information adequately justified the proposed revisions to the
22 gas quality provisions.

1 **Q. Please discuss Section 14 – Fuel Requirement.**

2 A. Section 14 was revised to implement a fuel tracking mechanism, with an annual true-up
 3 component. Revised Section 14 requires each firm and interruptible shipper to nominate
 4 and tender to Alliance, in addition to the gas nominated and tendered at the receipt point,
 5 an amount of energy determined on the basis of the applicable Fuel Requirement (fuel
 6 and lost or unaccounted for gas) established by Alliance and set forth in Sheet No. 10.
 7 Operational variance in linepack requirements will no longer be included in the Fuel
 8 Requirement determination. Instead, Alliance will be responsible for the management of
 9 its linepack.

10 The revised Section 14 further provides that the Fuel Requirement will be
 11 expressed as a percentage of a shipper’s nomination. The Fuel Requirement will be
 12 initially set at 2.0%, and its subsequent annual redetermination will be based on the
 13 preceding base year’s annual throughput, adjusted to reflect any differences between the
 14 actual fuel collected and the actual fuel used during the base period. The proposed
 15 revisions also require Alliance to revise the Fuel Requirement on November 1 each year.
 16 The fixing of fuel rates on an annual basis responds to shipper requests for greater
 17 commercial certainty. These changes were approved in P 48 of the June 30, 2015 Order.

18 **Q. Please discuss Section 16 – Unauthorized Volumes and Imbalances.**

19 A. On Substitute First Revised Sheet Nos. 233-234, certain provisions of Section 16 were
 20 revised to clarify the shipper’s responsibility for imbalances and to set forth procedures to
 21 be followed if a shipper does not clear any imbalance. Revised Section 16.3 requires
 22 each shipper to use all reasonable efforts to maintain the balance of the gas that is
 23 received in the shipper’s account and gas that is delivered by Alliance from the shipper’s

1 account at the receipt or entry points. Revised Section 16.5 now provides an imbalance
 2 tolerance for IT-1 shippers in addition to the tolerance currently provided to FT-1
 3 shippers. Consistent with the assumption of responsibility by Alliance for managing its
 4 operational linepack, revised Sections 16.7 and 16.13 provide that if a shipper of firm or
 5 interruptible service, wheeling service, or title transfer service fails to clear an imbalance,
 6 Alliance will retain the shipper’s remaining gas in its system as operational linepack.
 7 Likewise, the proceeds related to any gas effectively loaned as a result of a shipper failure
 8 to clear an imbalance would be retained by Alliance.

9 **Q. Please address Section 22 – Creditworthiness.**

10 A. For shippers who qualify by providing letters of credit, Alliance has reduced the cash
 11 deposit requirement from 12 months to 3 months in Section 22.1(c)(iii) to align the
 12 requirement with Commission policy. In situations where facilities are constructed or
 13 other capital expenditures are required to meet a new shipper’s capacity needs, Alliance
 14 proposes to retain the 12 month requirement. FERC approved this change in its June 30,
 15 2015 Order at P 48.

16 **Q. Please discuss Section 39 – Negotiated Rates.**

17 A. Alliance proposed a revision to GT&C Section 39.1 (a) to allow Alliance and a shipper
 18 to agree to a Negotiated Rate less than the minimum applicable Recourse Rate, currently
 19 set at \$0.00. As one of the new service offerings provided on Alliance Canada, shippers
 20 were invited to submit a single bid for “full path” capacity on both Alliance Canada and
 21 Alliance. To the extent that such a bid is accepted by Alliance in order to generate
 22 additional revenues, and such bid yields a full path negotiated rate which is less than the
 23 rate approved by the NEB for the Alliance Canada portion, a negative Negotiated Rate

1 would be required on Alliance to allow the transaction to be completed. While Alliance
 2 does not expect these circumstances to occur, it was essential to have the necessary tariff
 3 authority in place in advance of the filing of the actual Negotiated Rate. In these limited
 4 circumstances, Alliance submits that the revision to GT&C Section 39.1 (a) is just and
 5 reasonable. FERC approved this change in P 48 of the June 30, 2015 Order, and
 6 subsequently clarified it in its November 19, 2015 Order on Rehearing at P 69.

7 **Q. Please address Section 43 – Operational Purchases and Sales of Gas.**

8 A. On Substitute Original Sheet No. 288, Section 43.1 was revised to provide that
 9 operational sales and/or purchases of gas may also be made at delivery points on
 10 Alliance. Tariffs of other pipelines previously accepted by the Commission have allowed
 11 operational sales and purchases at delivery points. The added flexibility will assist
 12 Alliance in managing imbalance quantities and operational linepack variances.

13 To ensure all operational sales of natural gas are transacted in a fully non-
 14 discriminatory and competitive manner in accordance with Commission policy, Alliance
 15 will conduct such transactions through an industry recognized market exchange or
 16 clearinghouse, or in the alternative, through its existing bidding process. Alliance has also
 17 clarified that the bidding process is applicable to operational sales of natural gas pursuant
 18 to Commission policy.

19 These changes were approved by the Commission at P 48 of the June 30, 2015
 20 Order.

21 **Q. Please address Section 1 of Rate Schedule FT-1 and IT-1.**

22 A. In its motion to place suspended tariff sheets into effect, dated October 30, 2015, in
 23 Docket No. RP15-1022-000, Alliance revised Sections 1 of Rate Schedules FT-1 and IT-1

1 to provide that its acceptance of arrangements made for the processing of natural gas to
2 meet downstream transporters' gas quality specifications "shall not be unreasonably
3 withheld".

4 **Q. Does this conclude your testimony?**

5 A. Yes.

VERIFICATION

Brian Troicuk hereby declares under penalty of the laws of the United States that the foregoing document is true and correct to the best of his knowledge and belief, pursuant to 28 U.S.C. § 1746.

Executed this 7th day of January, 2016.

**UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION**

Alliance Pipeline L.P.

Docket No. RP15-1022-000 *et al.*

**SUMMARY OF PREPARED DIRECT TESTIMONY OF
TERRY MOLIK
ON BEHALF OF ALLIANCE PIPELINE L.P.**

Terry Molik is employed by Alliance Pipeline L.P. (“Alliance”) and provides Prepared Direct Testimony in this proceeding on behalf of Alliance. In his Prepared Direct Testimony, Terry Molik describes the economic life of Alliance’s pipeline.

1 **Prepared Direct Testimony of Terry Molik**

2 **I. Introduction**

3 **Q. Please state your name, title, and business address.**

4 A. My name is Terry Molik. My title is Specialist, Energy Economics at Alliance Pipeline
5 Ltd. My business address is Alliance Pipeline Ltd., 800, 605 – 5th Avenue S.W., Calgary,
6 Alberta T2P 3H5, Canada.

7 **Q. Please briefly describe your education and professional experience and**
8 **qualifications.**

9 A. I obtained an MA degree in Economics from the University of Calgary in 1999. I have
10 been working in the energy industry for approximately 15 years including working as an
11 Economist with the Alberta Energy and Utilities Board from 2001 to 2005. I have been
12 with Alliance in various economics related roles since 2007.

13 **Q. Have you previously testified before the Federal Energy Regulatory Commission**
14 **(“FERC” or “Commission”)?**

15 A. Yes, in these proceedings.

16 **Q. What is the purpose of your direct testimony?**

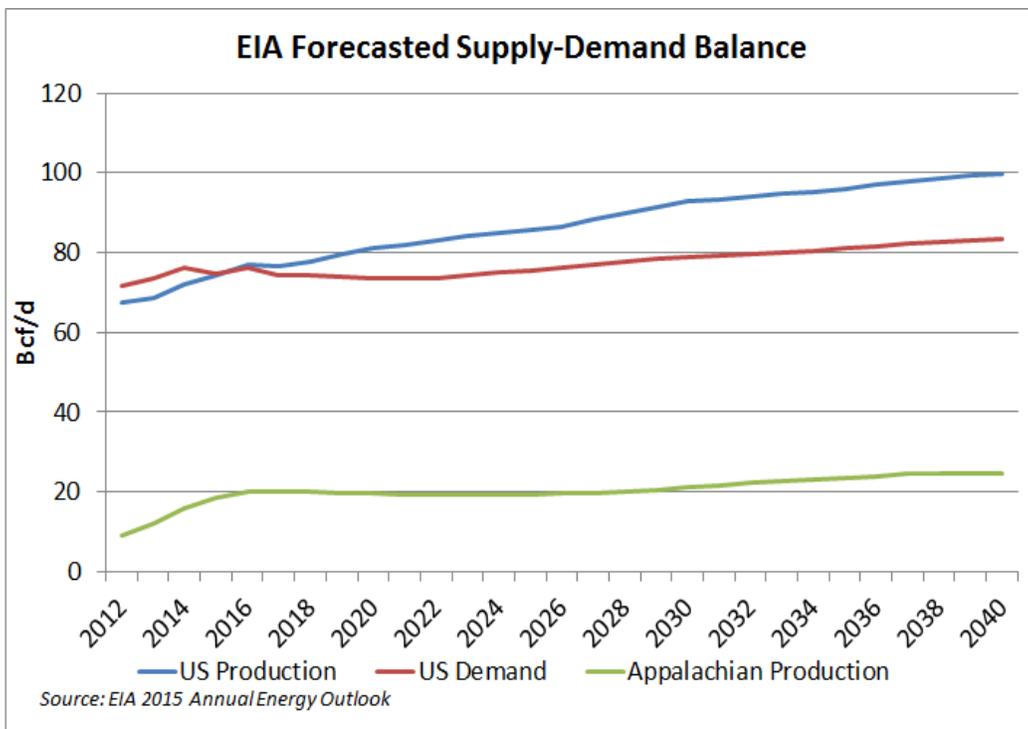

17 A. The purpose of my direct testimony in this proceeding is to explain Alliance’s economic
18 life of pipeline.

19 **II. Economic Life of Pipeline**

20 **Q. Please identify how you have identified Alliance’s life of pipeline.**

21 A. To identify Alliance’s economic life of pipeline, Alliance has used information from the
22 EIA’s 2015 Annual Energy Outlook (2015 AEO) which provides forecast data extending
23 out to 2040. A review of implications from the EIA’s forecast suggests that Alliance may

1 have difficulty maintaining throughput above the 50% utilization level beyond the mid-
 2 point of the 2030's. The 2015 AEO forecasts Canadian export pipeline flows to the
 3 United States. Their forecast suggests that such flows will reach a low point in the mid-
 4 2030's. The reason behind the decline of Canadian imports to the U.S. is primarily the
 5 significant growth of US production relative to demand growth, as shown in the chart
 6 below.

7

8 **Q. Please identify and describe the range of impacts that Alliance may face.**

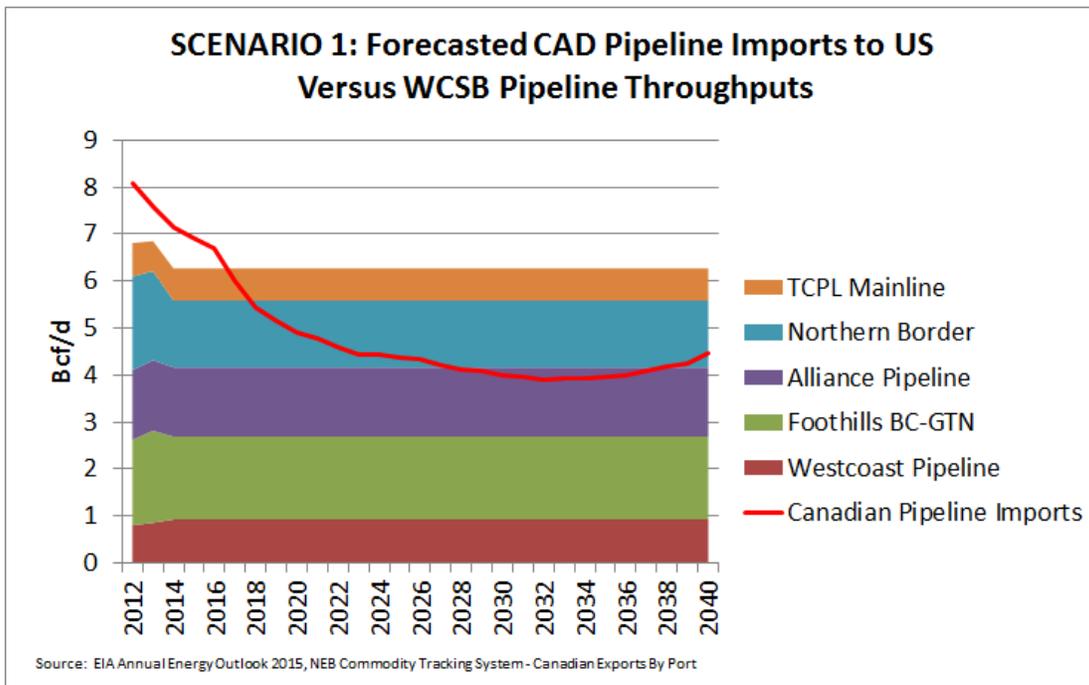

9 A. By making assumptions about the distribution of Canadian imports to the US across the
 10 five major WCSB export pipelines, a range of impacts to Alliance can be estimated. In all
 11 scenarios examined here, current export levels through Huntington and Kingsgate
 12 (Westcoast and GTN) are assumed to remain level as these westbound flows are, in
 13 Alliance's view, among the least likely to experience displacement from growing US

1 supplies of the WCSB export pipelines. The primary reason is that market demand,
2 market access and supply competition appear relatively stable for Western Canadian
3 Sedimentary Basin (WCSB)-sourced Pacific Northwest pipeline flows.

4 In contrast, Canadian deliveries to US markets in the US North-East, Mid-
5 Atlantic and Midwest regions appear vulnerable to potentially significant displacement
6 from growing production from the Marcellus and Utica shale plays generally
7 concentrated in the Mid-Atlantic region. The Appalachian region is expected to grow by
8 approximately 6 Bcf/d over the period from 2015 through 2040. Alliance, Northern
9 Border and the TransCanada Mainline are therefore assumed to have greater risk of
10 displacement as these pipelines deliver to the markets that are among those most
11 impacted by the production growth of the Marcellus and Utica shales.

12 **Q. Please describe the first scenario you consider.**

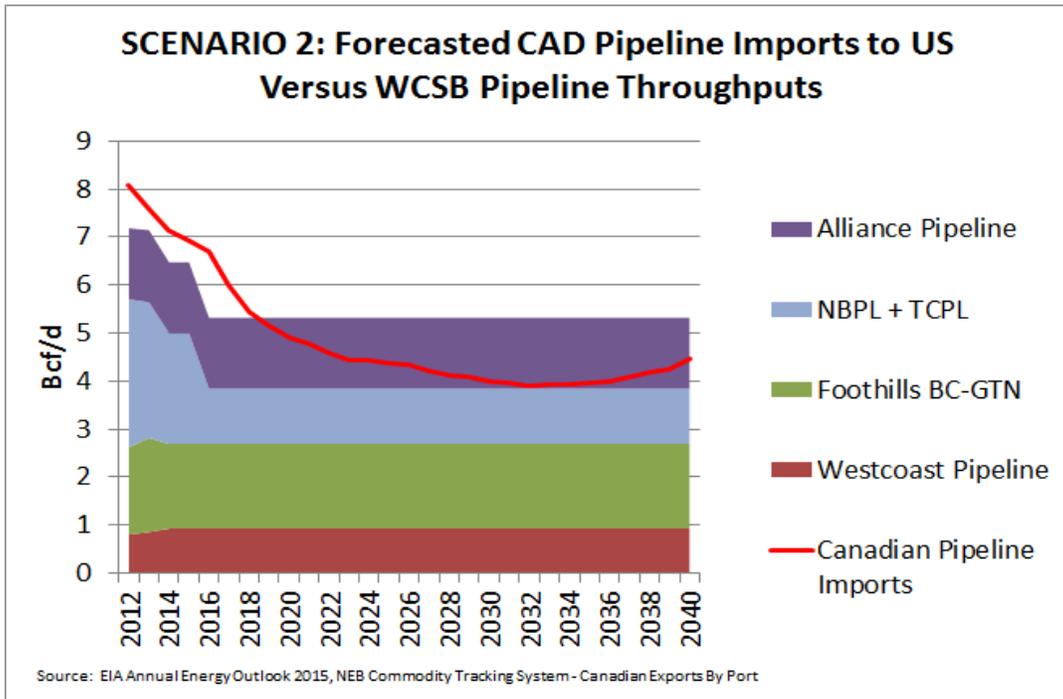

13 A. Scenario 1 shown below assumes that Northern Border and TransCanada experience the
14 greatest risk of displacement and consequently deliver no Canadian volumes to the US by
15 the mid-2030's. Under this assumption, Alliance flows are impacted minimally and there
16 is no significant risk to the continued economic operation of the pipeline.

1

2 **Q. Please describe the second scenario.**

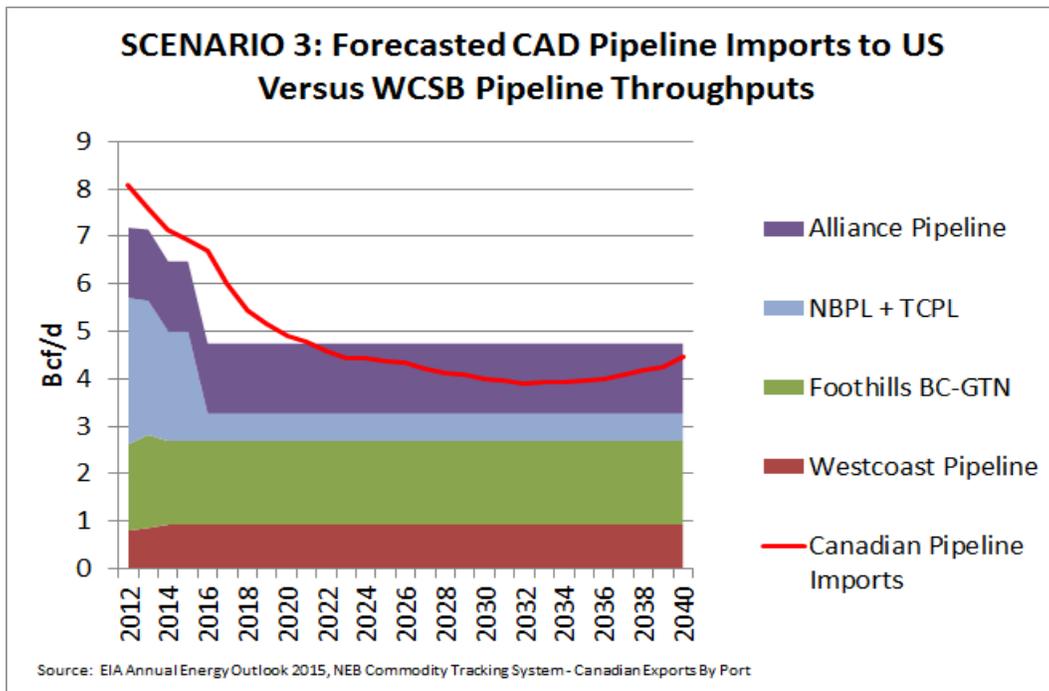

3 A. Scenario 2 assumes that Northern Border and TransCanada Mainline combined flows of
 4 WCSB volumes are reduced to 50% of 2014 levels. With this assumption, WCSB
 5 volumes available to move on Alliance Pipeline fall to virtually nothing by the mid-
 6 2030's.

1

2 **Q. Please describe the third scenario.**

3 A. The most likely impact to Alliance can potentially be determined by looking to the
 4 average of the first two “book-end” scenarios. In this average scenario (labelled Scenario
 5 3), Alliance would potentially lose over half of its throughput for a sustained period in the
 6 middle of the 2030’s. As a result, the Gannett-Fleming determination that economic life
 7 would extend through 2034 but not further, appears a reasonable estimate.

1

2 **Q. Please summarize the above scenarios.**

3 A. Alliance likely faces significant economic challenges to continued existing operations if

4 as little as 500 mmcf/d of Canadian volumes move on Northern Border or the

5 TransCanada Mainline combined, given the total import levels forecasted by the EIA.

6 Alliance believes it is certainly feasible that the TransCanada Mainline and Northern

7 Border would be able to accommodate significantly reduced flows from Canada without

8 shutting in because these systems also are able to move significant volumes of gas from

9 US production. For example, Northern Border has significant receipt capability from

10 Bakken production in North Dakota and also other Rockies production from its

11 interconnect with the 400 mmcf/d Bison Pipeline. Likewise, the TransCanada Mainline is

12 expected to receive significant volumes of Marcellus and Utica production from its

13 infrastructure in Southern Ontario and Quebec, which help to maintain revenue and

14 throughput for the system. These factors support the credibility of a scenario where

1 displacement of Canadian volumes is not an “all or nothing” scenario for these two
2 pipeline systems. It is Alliance’s view that WCSB flows of at least 500 mmcf/d on
3 Northern Border/TransCanada Mainline is a relatively conservative assumption and is
4 supportive of a 20 year economic life for Alliance Pipeline under the EIA’s forecast
5 assumptions.

6 **Q. Does this conclude your testimony on economic life?**

7 A. Yes, it does.

VERIFICATION

Terry Molik hereby declares under penalty of the laws of the United States that the foregoing document is true and correct to the best of his knowledge and belief, pursuant to 28 U.S.C. § 1746.

Executed this 7th day of January, 2016.

**UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION**

Alliance Pipeline L.P.

Docket No. RP15-1022-000 *et al.*

**SUMMARY OF PREPARED DIRECT TESTIMONY OF
NEIL COGHLAN
ON BEHALF OF ALLIANCE PIPELINE L.P.**

Neil Coghlan is employed by Alliance Pipeline L.P. (“Alliance”) and provides Prepared Direct Testimony in this proceeding on behalf of Alliance. In this Prepared Direct Testimony, Neil Coghlan describes negative salvage as it relates to the economic life of Alliance’s pipeline.

1 **Prepared Direct Testimony of Neil Coghlan**

2 **I. Introduction**

3 **Q. Please state your name, title, and business address.**

4 A. My name is Neil Coghlan. My title is Director, Finance Services and Controller. My
5 business address is Alliance Pipeline Ltd., 800, 605 – 5th Avenue S.W., Calgary, Alberta
6 T2P 3H5, Canada.

7 **Q. Please briefly describe your education and professional experience and**
8 **qualifications.**

9 A. I graduated from Carleton University earning a Bachelor of Arts degree. I am a Certified
10 Management Accountant earning that designation in 1985. I am currently registered with
11 the Society of Management Accountants of Alberta.

12 **Q. Have you previously testified before the Federal Energy Regulatory Commission**
13 **(“FERC” or “Commission”)?**

14 A. Yes.

15 **Q. What is the purpose of your direct testimony?**

16 A. The purpose of my direct testimony in this proceeding is to explain negative salvage as it
17 relates to Alliance’s economic life of pipeline.

18 **II. Negative Salvage**

19 **Q. Have you calculated a negative salvage rate for Alliance Pipeline?**

20 A. Yes. Alliance utilized engineering cost data previously used to calculate the cost of
21 pipeline abandonment in a filing with the National Energy Board in Canada. For
22 example, using cost estimates for the removal of meter stations on the Canadian pipeline
23 system, an average total removal cost per meter station was calculated. This average cost

1 per meter station was then applied to calculate the total cost of removing all meter
2 stations on the U.S. pipeline system. There are 13 meter stations on the Mainline system.
3 The Tioga lateral has one meter station, a regulating station and a pump station. The
4 average removal cost of the meter stations was also applied to the removal of the
5 regulating station and the pump station. This methodology was similarly repeated for
6 other types of facilities (compressor stations, block valves, and so forth).

7 **Q. How did you calculate a negative salvage rate for Alliance U.S.?**

8 A. The abandonment cost estimate was initially calculated in Canadian dollars and
9 converted to U.S. dollars based on a 5-year average Bank of Canada exchange rate.
10 Abandonment costs are mainly costs associated with the removal of above ground
11 facilities. The total abandonment cost estimate in U.S. dollars is \$43,010,955. I divided
12 that amount by the Alliance 20 year economic life to yield an annual recovery of
13 \$2,150,548 which when divided by the Alliance U.S. gross plant of \$1,976,927,131
14 yields a negative salvage rate of approximately 0.1%.

15 **Q. Does this conclude your testimony on negative salvage?**

16 A. Yes, it does.

VERIFICATION

Neil Coghlan hereby declares under penalty of the laws of the United States that the foregoing document is true and correct to the best of his knowledge and belief, pursuant to 28 U.S.C. § 1746.

Executed this 7th day of January, 2016.

A handwritten signature in black ink, appearing to read "Neil Coghlan", is written over a horizontal line. The signature is cursive and somewhat stylized.

**UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION**

Alliance Pipeline L.P.

Docket No. RP15-1022-000 *et al.*

**SUMMARY OF PREPARED DIRECT TESTIMONY OF
LARRY E. KENNEDY
ON BEHALF OF ALLIANCE PIPELINE L.P.**

Mr. Kennedy is employed by Gannett Fleming Canada ULC (“Gannett”) and provides Prepared Direct Testimony in this proceeding on behalf of Alliance Pipeline L.P. (“Alliance”). In his Prepared Direct Testimony, Mr. Kennedy describes Gannett’s depreciation study related to natural gas transmission pipeline assets of Alliance as of December 31, 2014. His report presents a description of the methods used in the estimation of depreciation, the analyses undertaken to estimate the equal life group of the asset groups, and the summary and detailed tabulations of annual and accrued depreciation. The calculated annual depreciation accrual rates presented here are applicable to plant in service assets as of December 31, 2014. The depreciation rates are based on the straight-line method, average service life procedure applied on a remaining life basis.

1 **Prepared Direct Testimony of Larry E. Kennedy**

2 **I. Introduction**

3 **Q. Please state your name, title, and business address.**

4 A. My name is Larry E. Kennedy. My title is Vice President at Gannett Fleming Canada
5 ULC. My business address is 200 Rivercrest Drive SE, Calgary, Alberta T2C 2X5,
6 Canada.

7 **Q. Please briefly describe your education and professional experience and**
8 **qualifications.**

9 A. I graduated from the Northern Alberta Institute of Technology with a Diploma of Applied
10 Arts – Business Administration in 1978. I have been a long term member of the Society
11 of Depreciation Professionals (SDP) and served as President of the SDP in the year 2000.
12 I have been accredited with the designation of “Certified Depreciation Professional” by
13 the SDP.

14 Following an 18 year career in the area of Plant Accounting and Depreciation
15 analysis with both Enbridge Pipelines (Then Interprovincial Pipeline) and TransCanada
16 Pipelines Ltd, I joined Gannett Fleming, Inc. in January 1999 and am a Vice President of
17 Gannett Fleming Canada ULC. My responsibilities include the assembly of data, the
18 preparation and review of depreciation studies, advice to clients regarding asset
19 retirement obligation accounting, plant accounting issues, and provision of general
20 regulatory litigation support. In this role I have been accepted as an expert witness in the
21 above areas in 42 oral public hearings. Additionally, I have presented evidence in 49
22 proceedings where oral testimony was not required.

1 **Q. Have you previously testified before the Federal Energy Regulatory Commission**
2 **(“FERC” or “Commission”)?**

3 A. No, however, I have testified on three occasions before the National Energy Board of
4 Canada.

5 **Q. What is the purpose of your direct testimony?**

6 A. The purpose of my direct testimony in this proceeding is to describe the depreciation
7 study related to natural gas transmission pipeline assets of Alliance as of December 31,
8 2014, in which we determined the annual depreciation accrual rates and amounts for
9 regulatory objectives.

10 **Q. Please briefly summarize the methods, scope, and results of the study.**

11 A. The depreciation rates are based on the straight line method using the Average Service
12 Life (“ASL”) procedure and were applied on a remaining life basis. The calculations
13 were based on attained ages and estimated average service life, and forecasting net
14 salvage characteristics for each depreciable group of assets. Variances between the
15 calculated accrued depreciation and the book accumulated depreciation as of
16 December 31, 2014 are amortized over the remaining life of assets.

17 This study has adopted an economic planning horizon ending December 31, 2034,
18 which reflects the current economic parameters representing the constraints impacting the
19 overall pipeline life.

20 Gannett Fleming recommends the calculated annual depreciation accrual rates set
21 forth herein apply specifically to transmission plant in service as of December 31, 2014
22 as summarized by Table 1 of the study by account detail. Supporting data and
23 calculations are provided as well within the study.

1 Finally, this study results in an annual depreciation expense accrual of \$41.6
 2 million when applied to depreciable plant balances as of December 31, 2014. The study
 3 results are summarized at an aggregate functional group level as follows:

SUMMARY OF ORIGINAL COST, ACCRUAL PERCENTAGES AND AMOUNTS

<u>PLANT GROUP</u>	<u>\$'s</u>	<u>% 's</u>	<u>\$'s</u>
(1)	(2)	(3)	(4)
TRANSMISSION	1,433,127,701	2.35	33,627,491
TIOGA LATERAL	161,069,833	4.96	7,984,420
TOTAL PLANT IN SERVICE	1,594,197,534	2.61	41,611,911

4

5 **Q. Please describe the scope of the depreciation study.**

6 A. This report sets forth the results of the depreciation study for Alliance Pipeline L.P., to
 7 determine the annual depreciation accrual rates and amounts for regulatory purposes
 8 applicable to the original cost of transmission plant at December 31, 2014. The rates and
 9 amounts are based on the straight line, remaining life method of depreciation. This report
 10 also describes the concepts, methods and judgments which underlie the recommended
 11 annual depreciation accrual rates related to plant in service as of December 31, 2014.

12 The service life estimates resulting from the study were based on: informed
 13 engineering judgment which incorporated analyses of historical plant retirement data as
 14 recorded through December 31, 2014; a review of Company practice and outlook as they
 15 relate to plant operation and retirement; and consideration of current practice in the gas
 16 industry, including knowledge of service lives used for other large diameter transmission
 17 pipeline companies.

1 **Q. Please outline the depreciation study.**

2 A. Part I is the Introduction, which contains statements with respect to the plan of the report,
3 and the basis of the study. Part II is the Development of Depreciation Parameters, which
4 presents descriptions of the methods used in the service life and net salvage studies. Part
5 III is the Calculation of Annual and Accrued Depreciation, which presents the methods
6 and procedures used in the calculation of depreciation. Part IV is the Results of Study,
7 which presents summaries by depreciable group of annual and accrued depreciation. Part
8 V is the Detail Depreciation Calculations, which presents the detailed tabulations of
9 annual and accrued depreciation.

10 **Q. Please describe the basis for the depreciation calculations.**

11 A. For most accounts, the annual and accrued depreciation were calculated by the straight
12 line method using the Average Service Life (“ASL”) procedure applied on a remaining
13 life basis. All types of calculations were based on original cost, attained ages, and
14 estimated service lives.

15 The straight line method, ASL procedure is a commonly used depreciation
16 calculation procedure that has been widely accepted in jurisdictions throughout North
17 America. Gannett Fleming recommends its continued use for regulatory purposes.

18 **Q. Please describe the basis for the service life estimates.**

19 A. The service life used in the depreciation and amortization calculations were based on
20 informed judgment which incorporated a review of management’s plans, policies and
21 outlook, a general knowledge of the gas pipeline industry, and comparisons of the service
22 life estimates from our studies of other large diameter transmission pipelines. The use of
23 survivor curves to reflect the expected dispersion of retirement provides a consistent

1 method of estimating depreciation for gas plant. Iowa type survivor curves were used to
 2 depict the estimated survivor curves for the plant accounts not subject to amortization
 3 accounting.

4 The procedure for estimating service lives consisted of compiling historical data
 5 for the plant accounts or depreciable groups, analyzing this history through the use of
 6 widely accepted techniques, and forecasting the survivor characteristics for each
 7 depreciable group on the basis of interpretations of the historical data analyses and the
 8 probable future. The combination of the historical experience and the estimated future
 9 yielded estimated survivor curves from which the average service lives were derived.

10 The depreciation rates should be reviewed periodically to reflect the changes that result
 11 from plant and accumulated depreciation account activity. A depreciation reserve
 12 deficiency or surplus will develop if future capital expenditures vary significantly from
 13 those anticipated in this study.

14 **II. Development of Depreciation Parameters**

15 **Q. Please explain the concept, application, and calculation of depreciation.**

16 A. Depreciation, in public utility regulation, is the loss in service value not restored by
 17 current maintenance, incurred in connection with the consumption or prospective
 18 retirement of utility plant in the course of service from causes which are known to be in
 19 current operation and against which the utility is not protected by insurance. Among
 20 causes to be given consideration are wear and tear, deterioration, action of the elements,
 21 inadequacy, obsolescence, changes in the art, changes in demand, and the requirements of
 22 public authorities.

1 Depreciation, as used in accounting, is a method of distributing fixed capital
 2 costs, less net salvage, over a period of time by allocating annual amounts to expense.
 3 Each annual amount of such depreciation expense is part of that year’s total cost of
 4 providing gas transportation service. Normally, the period of time over which the fixed
 5 capital cost is allocated to the cost of service is equal to the period of time over which an
 6 item renders service, that is, the item’s service life. The most prevalent method of
 7 allocation is to distribute an equal amount of cost to each year of service life. This
 8 method is known as the straight-line method of depreciation.

9 The calculation of annual and accrued depreciation based on the straight line
 10 method requires the estimation of survivor curves and is described in the following
 11 sections of this report. The development of the proposed depreciation rates also requires
 12 the selection of appropriate depreciation procedures, as discussed in Part III of this report.

13 **Q. Please explain the estimation of survivor curves.**

14 A. The use of an average service life for linear pipelines recognizes that assets within the
 15 property accounts can have different lives. Thus, the average life may be obtained by
 16 determining the separate lives of each of the units, or by constructing a survivor curve by
 17 plotting the number of units which survive at successive ages using the retirement rate
 18 method of analysis.

19 The range of survivor characteristics usually experienced by utility and industrial
 20 properties is encompassed by a system of generalized survivor curves known as the Iowa
 21 type curves. There are four families in the Iowa system, labeled in accordance with the
 22 location of the modes of the retirements in relationship to the average life and relative
 23 height of the modes. The left-moded curves are those in which the greatest frequency of

1 retirement occurs to the left of, or prior to, average service life. The symmetrical-moded
 2 curves are those in which the greatest frequency of retirement occurs at average service
 3 life. The right-moded curves are those in which the greatest frequency occurs to the right
 4 of, or after, the average service life. The origin-moded curves are those in which the
 5 greatest frequency of retirement occurs at the origin, or immediately after age 0. The
 6 letter designation of each family of curves (L, S, R or O) represents the mode of the
 7 associated frequency curve with respect to the average service life. The numerical
 8 subscripts represent the relative heights of the modes of the frequency curves within each
 9 family.

10 A discussion of the general concept of survivor curves and the retirement rate
 11 method is presented in Part V.

12 **Q. Please describe the judgments underlying the survivor curve estimates.**

13 A. The survivor curve estimates were based on judgment which considered a number of
 14 factors. The primary factors were the statistical analysis of data; current policies and
 15 outlook as determined during conversations with management personnel and on the
 16 knowledge Gannett Fleming developed through the completion of numerous electric
 17 utility studies.

18 The following discussion, dealing with a number of accounts which comprise the
 19 majority of the investment analyzed, presents an overview of the factors considered by
 20 Gannett Fleming in the determination of the average service life estimates. The survivor
 21 curve estimates for the remainder of the accounts not discussed in the following sections
 22 were based on similar considerations.

1 **Q. Which companies were reviewed to develop the average service life estimates?**

2 The following were the peer group of companies reviewed in order to develop average
3 service life estimates:

- 4 • TransCanada Pipelines Limited;
- 5 • Kinder Morgan;
- 6 • Enbridge Pipelines Inc.; and
- 7 • FortisBC Energy Inc.

8 **Q. Why were these companies considered as peer companies?**

9 A. The above companies were considered as peer companies on the basis of the following
10 criteria:

- 11 • All have had depreciation studies recently completed by Gannett Fleming. As such
12 Gannett Fleming is familiar with the physical plant, operating circumstances and
13 management policies affecting depreciation for each company;
- 14 • All are large diameter, regulated, long haul pipelines; and
- 15 • All have a significant level of retirement experience for which studies of actual
16 historic retirement transactions were made.

17 **Q. Please discuss the factors considered in the determination of the average service life**
18 **for the accounts with significant amounts of investment, beginning with Account**
19 **320.00.**

20 A. Account 320.00 – Transmission - Mainline Pipe represents 68.2% of the depreciable
21 plant as of December 31, 2014. The average service life indication for this account
22 recognized the indications from the Pipeline Integrity and Corridor Management group

1 which provided information regarding the increased standards of the Alliance pipe as
2 compared to the peer industry installations. The pipeline was built to an increased
3 standard due to the requirement to operate at a higher than normal operating pressure.
4 Alliance, like all new large diameter pipelines, completed a baseline pigging program
5 within five years of being placed into service. Additionally, the pipeline is subjected to a
6 five to seven year inspection pigging cycle in the periods following the baseline
7 inspection. Given the original in-service date of 2000, this aggressive inspection pigging
8 program is very proactive in nature. It is also noted that the inspection program is
9 completed using high resolution inspection tools.

10 The technology and materials employed in the milling of the pipe employed state
11 of the art processes. The testing of the pipe at the time of construction was far more
12 extensive than the testing required of the pipe installed by other peer large diameter
13 pipelines. The increased testing and more aggressive pigging inspection programs are a
14 result of the higher operating pressure of the Alliance system as compared to historic
15 natural gas transmission pipelines.

16 Given the system integrity programs, the increased testing requirements at the
17 time of the Alliance pipe manufacture and the proactive pipe inspection program, Gannett
18 Fleming recommends the use of a 70-year average service life. Additionally, Gannett
19 Fleming views that the Iowa R4 retirement dispersion curve is appropriate. Therefore,
20 Gannett Fleming has incorporated the use of the Iowa 70-R4 curve into the depreciation
21 rate calculations for this account.

1 **Q. Please discuss the factors considered in the determination of the average service life**
 2 **for Account 400.00.**

3 A. Account 400.00 – Transmission - Compressor represents 12.2% of the depreciable plant
 4 as of December 31, 2014. The average service life indication for this account was based
 5 on the comments of the internal operating staff, and on the experience of Gannett
 6 Fleming in the selection of compression average service life estimates for the peer group
 7 of companies. The Alliance system includes a number of “mainline compressors” which
 8 are all driven by turbine engines that run at or above capacity. While this equipment has
 9 shown to be reliable to date, it is subjected to on-going inspections every 4,000 operating
 10 hours, with larger inspections undertaken at 8,000 hours. Additionally, the equipment is
 11 overhauled every 16,000 to 24,000 hours. It is the view of the operating staff that this
 12 mainline compression equipment should have a life expectancy of at least 35 years.
 13 Based on the experience of Gannett Fleming and the views of the internal Alliance
 14 operating staff, an Iowa 35-R2.5 is recommended for this account.

15 **Q. Please discuss the factors considered in the determination of the average service life**
 16 **for Account 360.10.**

17 A. Account 360.10 – Tioga Lateral - Lateral represents 7.2% of the depreciable plant as of
 18 December 31, 2014. The Tioga Lateral was constructed in 2013. This 80- mile 12 inch
 19 lateral connects a natural gas processing facility near Tioga, ND to the Alliance mainline
 20 system near Sherwood, ND.

21 A review of the peer group of pipelines indicates that approved average service
 22 lives are between 35 and 45 years. As a result of the new pipe technology used in this
 23 system Gannett Fleming views that an average service life longer than the peer pipeline

1 group is reasonable. Therefore, Gannett Fleming recommends the Iowa 50-R2 for this
2 account.

3 **Q. Please discuss the factors considered in the determination of the average service life**
4 **for Account 310.00.**

5 A. Account 310.00 – Transmission - Land Rights represents 5.3% of the depreciable plant as
6 of December 31, 2014. It is the view of the operating staff that Land Rights should have
7 a life expectancy of 70 years. Therefore, Gannett Fleming has incorporated the use of the
8 Iowa 70-R4 curve into the depreciation rate calculations for this account.

9 **Q. Please discuss the factors considered in the determination of the average service life**
10 **for Account 500.00.**

11 A. Account 500.00 – Transmission - Meter Stations represents 2.3% of the depreciable plant
12 as of December 31, 2014 and relates to the assets at both the receipt and delivery points.
13 The metering within the Alliance system is completely comprised of ultra-sonic
14 equipment. To date the heads on the ultra-sonic meters have required replacement. The
15 internal Alliance metering staff has indicated an expected life expectancy of 35 years. A
16 review of the peer group of pipelines indicates approved average service life indications
17 of between 20 and 35 years. Given that the entire fleet is comprised of ultra-sonic
18 meters, and that Alliance is subjected to less frequent testing, Gannett Fleming views that
19 an average service life that is on the long side of the peer pipeline group is reasonable.
20 Therefore, Gannett Fleming recommends the Iowa 35-R3 for this account.

1 **Q. Please discuss the factors considered in the determination of the average service life**
2 **for Account 400.10.**

3 A. Account 400.10 – Tioga Lateral - Compressor represents 1.6% of the depreciable plant as
4 of December 31, 2014. The average service life indication for this account was based on
5 the comments of the internal operating staff, and on the experience of Gannett Fleming in
6 the selection of compression average service life estimates for the peer group of
7 companies. Therefore, Gannett Fleming recommends the Iowa 30-R2 for this account.

8 **Q. Please discuss the factors considered in the determination of the average service life**
9 **for the remaining accounts.**

10 A. Regarding the remaining accounts – the above analysis provides the consideration
11 relating to 97% of the depreciable plant. The analysis of the accounts relating to the
12 remaining 3% of the investment as of December 31, 2014 considered a similar review of
13 operational comments, peer reviews and experience of Gannett Fleming.

14 **Q. Please discuss the relevant economic planning horizon.**

15 A. The service life of the Alliance Pipeline L.P. assets is restricted not only by physical
16 forces of retirement such as wear and tear and deterioration, but also, and more
17 significantly, by economic forces of retirement. Generally, physical forces of retirement
18 are less likely to occur than retirement of large portions of the pipeline system due to
19 economic forces. Specifically, the economic exhaustion of natural gas supply, the
20 changing North American marketplace for natural gas demand, and the competitive
21 influences in the Western Canada Sedimentary Basin have a significant impact on the
22 estimated service lives of the Alliance system.

1 The concept referred to with the terms “economic life” or “economic planning
 2 horizon” or “truncation date” (which has similar meaning within depreciation literature)
 3 is the key parameter used to set appropriate depreciation rates that accurately reflect the
 4 annual consumption in service value. Appropriate depreciation rates also help to ensure
 5 that both long term generational equity and a reasonable opportunity for the recovery of
 6 investment are achievable, over the expected useful life of the pipeline assets.

7 The economic planning horizon for a system comprised of one large single asset,
 8 is generally set to a single date that represents the estimated end of the planning horizon
 9 (or economic life) of the entire system. Gannett Fleming views that the determination of
 10 the anticipated economic life of large diameter transmission pipelines can be based on a
 11 number of different factors. While these factors are criteria for the development of an
 12 economic planning horizon from a theoretical standpoint, it is important to note that not
 13 all factors affecting economic life may be relevant to every transmission pipeline.
 14 Generally, the appropriate economic life is developed from the merger of a number of
 15 these factors.

16 **Q. What are the appropriate factors to consider in determining economic planning**
 17 **horizons for large diameter transmission pipelines, and how should they be applied?**

18 A. Gannett Fleming views that the following are appropriate factors to consider in
 19 determining an economic planning horizon for large diameter transmission pipelines:

- 20 1. Availability of supply to the pipeline;
- 21 2. Availability of market demand;
- 22 3. Consumption of service value;
- 23 4. Engineering based retirement studies;

- 1 5. Competitiveness of the pipeline;
- 2 6. Opportunity for the recovery of the investment;
- 3 7. Projected long term use of the pipeline;
- 4 8. Approved economic planning horizons of peer companies; and
- 5 9. Management discretion.

6 When consideration is given to the use of the above factors, whether individually
7 considered or reviewed in combinations, it is critical to note that the overall goal of
8 inclusion of economic life considerations in the development of depreciation rates is to
9 provide for a reasonable assurance of recovery of invested capital proportionally from
10 those using the pipeline system, and over the expected useful life of the pipeline.

11 **Q. Please discuss the application of the above factors to Alliance.**

12 A. The Alliance pipeline system was originally approved by the Federal Energy Regulatory
13 Commission (“FERC”), with an estimated economic life of 25 years. As such, the
14 original contractual agreements and transportation rates were developed on the
15 assumption of a 25-year economic life.

16 A supply and market demand study undertaken by Alliance as part of this
17 depreciation study has not indicated that it is likely that the Alliance system will be
18 uneconomic after the year 2025. It is currently anticipated that the system will be
19 contracted for service through contract renewals and will be competitive with other
20 natural gas pipelines sourcing supply from the Western Canadian Sedimentary Basin for
21 the next 20-year period, however, the contracting circumstances beyond 2034 are not
22 known. Therefore an economic planning horizon extending beyond 2034 is not
23 reasonable.

1 The depreciation rates of most federally regulated North American transmission
 2 pipelines have recognized the economic influences in the determination of the remaining
 3 lives of the systems. Over a period through 1999 most regulators have approved a 25-
 4 year planning horizon into the depreciation rates. Additionally, the concept of planning
 5 horizons was widely used for regulatory purposes.

6 **Q. Please discuss and evaluate the relationship between economic life and depreciation**
 7 **in the case of Alliance.**

8 A. It is the view of Gannett Fleming that recognition of an economic life must be
 9 incorporated into the depreciation rates of Alliance. The planning horizon is meant to
 10 indicate the average date of significant terminal pipeline retirement. As this date is based
 11 on an average of the expected retirement of significant portions of the pipeline system,
 12 the planning horizon is not the expected date of cessation of natural gas transportation
 13 service on the Alliance Pipeline. For example, it may be expected that not all of the
 14 mainline compressors or compression equipment will retire at one time due to economic
 15 conditions. Rather a pattern of rationalization of compression equipment developed in
 16 the future based on the facts and circumstances at that time may be the most reasonable
 17 approach. As such, a significant portion of the compression equipment may terminally
 18 retire prior to the planning horizon date and a significant portion may retire after.

19 However, the planning horizon represents a reasonable average expectation at this time.
 20 Based on the review of the criteria discussed above, Gannett Fleming views that the
 21 economic planning horizon developed internally by Alliance is reasonable. Therefore,
 22 Gannett Fleming recommends the incorporation of a 20-year planning horizon into the
 23 depreciation rate calculations. Additionally, Gannett Fleming recommends that Alliance

1 monitors the recovery of its investment in this line in order that subsequent capital
 2 additions are fully recovered through the period ending over which the investment
 3 provides service to the customer. The planning horizon is incorporated in the estimated
 4 survivor characteristics by truncating the survivor curve which represents the physical
 5 life of the facilities at the attained age of each vintage as of December 31, 2034.

6 **III. Calculation of Annual and Accrued Depreciation**

7 **Q. Please discuss the group depreciation procedures used in the calculation of annual
 8 and accrued depreciation.**

9 A. When more than a single item of property is under consideration, a group procedure for
 10 depreciation is appropriate because normally all of the items within a group do not have
 11 identical service lives, but have lives that are dispersed over a range of time. There are
 12 two primary group procedures, namely, the average service life and equal life group
 13 procedures.

14 In the average service life procedure, the rate of annual depreciation is based on
 15 the average service life of the group, and this rate is applied to the surviving balances of
 16 the group's cost. A characteristic of this procedure is that the cost of plant retired prior to
 17 average life is not fully recouped at the time of retirement, whereas the cost of plant
 18 retired subsequent to the average life is more than fully recouped. Over the entire life
 19 cycle, the portion of cost not recouped prior to average life is balanced by the cost
 20 recouped subsequent to average life.

21 In the Equal Life Group ("ELG") procedure, the property group is subdivided
 22 according to service life. That is, each equal life group includes that portion of the
 23 property which experiences the life of that specific group. The relative size of each equal

1 life group is determined from the property's life dispersion curve. The calculated
 2 depreciation for the property group is the summation of the calculated depreciation based
 3 on the service life of each equal life group.

4 In the determination of the depreciation rates in this study, the use of the average
 5 service life procedure has been used. While the equal life group procedure provides an
 6 enhanced matching of depreciation expense to the consumption of service value, the
 7 average service life procedure is widely used throughout North America and was used in
 8 order to conform to past regulatory practices of this company and by other FERC
 9 regulated transmission pipelines.

10 **Q. Please discuss the monitoring of book accumulated depreciation.**

11 A. For the purposes of calculating remaining life accrual rates, the book depreciation reserve
 12 for each plant account is allocated among vintages in proportion to the calculated accrued
 13 depreciation for the account. The calculated accrued depreciation for each depreciable
 14 property group represents that portion of the depreciable cost of the group which would
 15 not be allocated to expense through future depreciation accruals if current forecasts of
 16 service life characteristics and net salvage materialize, and are used as a basis for
 17 depreciation accounting.

18 In the average life group procedure, the remaining life annual accrual for each
 19 vintage is determined by dividing future book accruals (original cost less book reserve)
 20 by the average remaining life for the surviving original cost of that vintage. The average
 21 remaining life is defined by the estimated future survivor curve.

22 The annual accrual rate for each account is equal to the sum of the remaining life
 23 annual accruals divided by the total original cost. The composite remaining life is

1 calculated by dividing the sum of the future book accruals by the sum of the remaining
 2 life annual accruals.

3 **IV. Results of Study**

4 **Q. Please discuss any applicable qualification of the study's results.**

5 A. The calculated annual and accrued depreciation are the principal results of the study.
 6 Continued surveillance and periodic revisions are normally required to maintain
 7 continued use of appropriate annual depreciation accrual rates. An assumption that
 8 accrual rates can remain unchanged over a long period of time implies a disregard for the
 9 inherent variability in service lives for the change of the composition of property in
 10 service. The annual accrual rates and the accrued depreciation were calculated in
 11 accordance with the straight line method, using the equal life group procedure based on
 12 estimates which reflect considerations of current historical evidence and expected future
 13 conditions.

14 **Q. Please describe the detailed tabulations of the study.**

15 A. The service life estimates were based on judgment that incorporated statistical analysis of
 16 retirement data, discussions with management and consideration of estimates made for
 17 other pipelines.

18 The tables of the calculated annual depreciation applicable to depreciable assets
 19 as of December 31, 2014 are presented in account sequence starting on page V-2 of the
 20 supporting documents. The tables indicate the estimated average survivor curves used in
 21 the calculations. The tables set forth, for each installation year, the original cost,
 22 calculated accrued depreciation, and the calculated annual accrual.

V. Estimation of Survivor Curves

Q. Please explain the concept and application of average service life.

A. The use of an average service life for a property group implies that the various units in the group have different lives. Thus, the average life may be obtained by determining the separate lives of each of the units, or by constructing a survivor curve by plotting the number of units which survive at successive ages. A discussion of the general concept of survivor curves is presented. Also, the Iowa type survivor curves are reviewed.

Q. Please explain and discuss survivor curves.

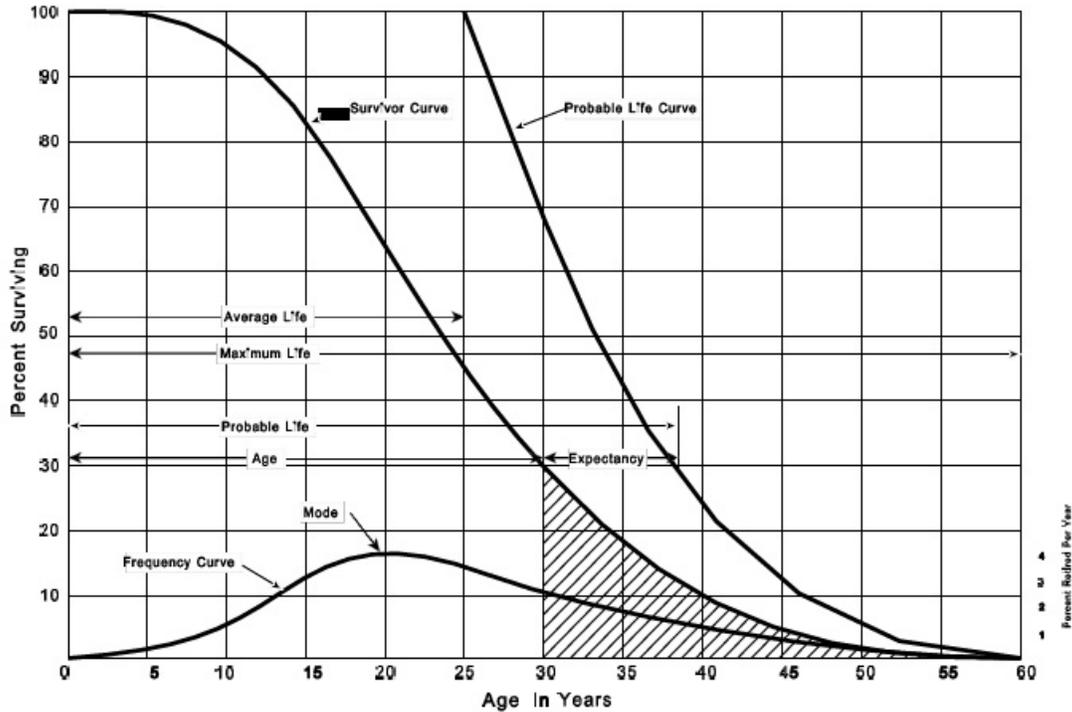

A. The survivor curve graphically depicts the amount of property existing at each age throughout the life of an original group. From the survivor curve, the average life of the group, the remaining life expectancy, the probable life, and the frequency curve can be calculated. In Figure 1, a typical smooth survivor curve and the derived curves are illustrated. The average life is obtained by calculating the area under the survivor curve, from age zero to the maximum age, and dividing this area by the ordinate at age zero. The remaining life expectancy at any age can be calculated by obtaining the area under

1 the curve, from the observation age to the maximum age, and dividing this area by the
 2 percent surviving at the observation age. For example, in Figure 1, the remaining life at
 3 age 30 is equal to the crosshatched area under the survivor curve divided by 29.5 percent
 4 surviving at age 30. The probable life at any age is developed by adding the age and
 5 remaining life. If the probable life of the property is calculated for each year of age, the
 6 probable life curve shown in the chart can be developed. The frequency curve presents
 7 the number of units retired in each age interval. It is derived by obtaining the differences
 8 between the amount of property surviving at the beginning and at the end of each
 9 interval.

10 **Q. Please explain “Iowa type curves.”**

11 A. The range of survivor characteristics usually experienced by utility and industrial
 12 properties is encompassed by a system of generalized survivor curves known as the Iowa
 13 type curves. There are four families in the Iowa system, labeled in accordance with the
 14 location of the modes of the retirements in relationship to the average life and the relative
 15 height of the modes. The left moded curves, presented in Figure 2, are those in which the
 16 greatest frequency of retirement occurs to the left of, or prior to, average service life. The
 17 symmetrical moded curves, presented in Figure 3, are those in which the greatest
 18 frequency of retirement occurs at average service life. The right moded curves, presented
 19 in Figure 4, are those in which the greatest frequency occurs to the right of, or after,
 20 average service life. The origin moded curves, presented in Figure 5, are those in which
 21 the greatest frequency of retirement occurs at the origin, or immediately after age zero.
 22 The letter designation of each family of curves (L, S, R or O) represents the location of
 23 the mode of the associated frequency curve with respect to the average service life. The

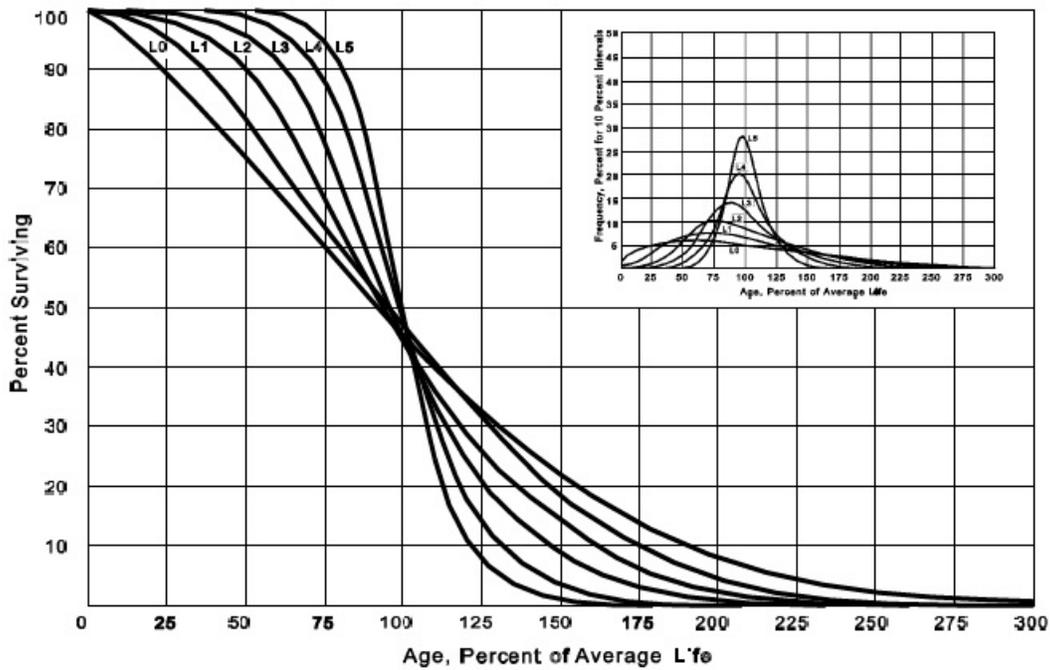

1 numbers represent the relative heights of the modes of the frequency curves within each
 2 family.

3 **Figure 1. A Typical Survivor Curve and Derived Curves**

4 The Iowa curves were developed at the Iowa State College Engineering Experiment
 5 Station through an extensive process of observation and classification of the ages at
 6 which industrial property had been retired. A report of the study which resulted in the
 7 classification of property survivor characteristics into 18 type curves, which constitute
 8 three of the four families, was published in 1935 in the form of the Experiment Station's
 9 Bulletin 125.1 These curve types have also been presented in subsequent Experiment
 10 Station bulletins and in the text, "Engineering Valuation and Depreciation."² In 1957,
 11 Frank V. B. Couch, Jr., an Iowa State College graduate student, submitted a thesis

1 presenting his development of the fourth family consisting of the four O type survivor
2 curves.

2 **Q. Please discuss the retirement rate method of analysis.**

3 A. The retirement rate method is an actuarial method of deriving survivor curves using the
 4 average rates at which property of each age group is retired. The method relates to
 5 property groups for which aged accounting experience is available and is the method
 6 used to develop the original stub survivor curves in this study. The method (also known
 7 as the annual rate method) is illustrated through the use of an example in the following
 8 text, and is also explained in several publications, including "Statistical Analyses of
 9 Industrial Property Retirements," 4 "Engineering Valuation and "Depreciation," 5 and
 10 "Depreciation Systems."6

11 The average rate of retirement used in the calculation of the percent surviving for
 12 the survivor curve (life table) requires two sets of data: first, the property retired during a
 13 period of observation, identified by the property's age at retirement; and second, the

1 property exposed to retirement at the beginning of the age intervals during the same
2 period. The period of observation is referred to as the experience band, and the band of
3 years which represent the installation dates of the property exposed to retirement during
4 the experience band is referred to as the placement band. An example of the calculations
5 used in the development of a life table follows. The example includes schedules of
6 annual aged property transactions, a schedule of plant exposed to retirement, a life table
7 and illustrations of smoothing the stub survivor curve.

8 **Q. Please discuss the schedules of annual transactions in plant records.**

9 A. The property group used to illustrate the retirement rate method is observed for the
10 experience band 2005-2014 during which there were placements during the years 2000-
11 2014. In order to illustrate the summation of the aged data by age interval, the data were
12 compiled in the manner presented in Schedules 1 and 2 on the following pages. In
13 Schedule 1, the year of installation (year placed) and the year of retirement are shown.
14 The age interval during which a retirement occurred is determined from this information.
15 In the example which follows, \$10,000 of the dollars invested in 2000 were retired in
16 2005. The \$10,000 retirement occurred during the age interval between 4½ and 5½ years
17 on the basis that approximately one-half of the amount of property was installed prior to
18 and subsequent to July 1 of each year. That is, on the average, property installed during a
19 year is placed in service at the midpoint of the year for the purpose of the analysis. All
20 retirements also are stated as occurring at the midpoint of a one-year age interval of time,
21 except the first age interval which encompasses only one-half year.

SCHEDULE 1. RETIREMENTS FOR EACH YEAR 2005-2014

^c Sale with Continued Use

Parentheses Denote Credit Amount.

2

3

The total retirements occurring in each age interval in a band are determined by summing

4

the amounts for each transaction year-installation year combination for that age interval.

1 For example, the total of \$143,000 retired for age interval 4½-5½ is the sum of the
 2 retirements entered on Schedule 1 immediately above the stair step line drawn on the
 3 table beginning with the 2005 retirements of 2000 installations and ending with the 2014
 4 retirements of the 2009 installations. Thus, the total amount of 143 for age interval 4½-
 5 5½ equals the sum of:

$$10 + 12 + 13 + 11 + 13 + 13 + 15 + 17 + 19 + 20.$$

6
 7 In Schedule 2, other transactions which affect the group are recorded in a similar manner.
 8 The entries illustrated include transfers and sales. The entries which are credits to the
 9 plant account are shown in parentheses. The items recorded on this schedule are not
 10 totaled with the retirements, but are used in developing the exposures at the beginning of
 11 each age interval.

12 **Q. Please discuss the schedule of plant exposed to retirement.**

13 A. The development of the amount of plant exposed to retirement at the beginning of each
 14 age interval is illustrated in Schedule 3 on the following page. The surviving plant at the
 15 beginning of each year from 2005 through 2014 is recorded by year in the portion of the
 16 table headed “Annual Survivors at the Beginning of the Year.” The last amount entered
 17 in each column is the amount of new plant added to the group during the year. The
 18 amounts entered in Schedule 3 for each successive year following the beginning balance
 19 or addition, are obtained by adding or subtracting the net entries shown on Schedules 1
 20 and 2. For the purpose of determining the plant exposed to retirement, transfers-in are
 21 considered as being exposed to retirement in this group at the beginning of the year in
 22 which they occurred, and the sales and transfers-out are considered to be removed from
 23 the plant exposed to retirement at the beginning of the following year. Thus, the amounts

1 of plant shown at the beginning of each year are the amounts of plant from each
 2 placement year considered to be exposed to retirement at the beginning of each
 3 successive transaction year. For example, the exposures for the installation year 2006 are
 4 calculated in the following manner:

Exposures at age 0	= amount of addition	= \$750,000
Exposures at age ½	= \$750,000 - \$ 8,000	= \$742,000
Exposures at age 1½	= \$742,000 - \$18,000	= \$724,000
Exposures at age 2½	= \$724,000 - \$20,000 - \$19,000	= \$685,000
Exposures at age 3½	= \$685,000 - \$22,000	= \$663,000

5
 6 For the entire experience band 2005-2014, the total exposures at the beginning of an age
 7 interval are obtained by summing diagonally in a manner similar to the summing of the
 8 retirements during an age interval (Schedule 1). For example, the figure of 3,789, shown
 9 as the total exposures at the beginning of age interval 4½-5½, is obtained by summing:

$$255 + 268 + 284 + 311 + 334 + 374 + 405 + 448 + 501 + 609.$$

^aAdditions during the year.

1 **Q. Please discuss the original life table.**

2 A. The original life table, illustrated in Schedule 4 on the following page, is developed from
 3 the totals shown on the schedules of retirements and exposures, Schedules 1 and 3,
 4 respectively. The exposures at the beginning of the age interval are obtained from the
 5 corresponding age interval of the exposure schedule, and the retirements during the age
 6 interval are obtained from the corresponding age interval of the retirement schedule. The
 7 retirement ratio is the result of dividing the retirements during the age interval by the
 8 exposures at the beginning of the age interval. The percent surviving at the beginning of
 9 each age interval is derived from survivor ratios, each of which equals one minus the
 10 retirement ratio. The percent surviving is developed by starting with 100% at age zero
 11 and successively multiplying the percent surviving at the beginning of each interval by
 12 the survivor ratio, i.e., one minus the retirement ratio for that age interval. The
 13 calculations necessary to determine the percent surviving at age 5½ are as follows:

Percent surviving at age 4½	= 88.15
Exposures at age 4½	= 3,789,000
Retirements from age 4½ to 5½	= 143,000
Retirement Ratio	= 143,000 ÷ 3,789,000 = 0.0377
Survivor Ratio	= 1.000 - 0.0377 = 0.9623
Percent surviving at age 5½	= (88.15) x (0.9623) = 84.83

14
 15 The totals of the exposures and retirements (columns 2 and 3) are shown for the purpose
 16 of checking with the respective totals in Schedules 1 and 3. The ratio of the total
 17 retirements to the total exposures, other than for each age interval, is meaningless. The
 18 original survivor curve is plotted from the original life table (column 6, Schedule 4).
 19 When the curve terminates at a percent surviving greater than zero, it is called a stub
 20 survivor curve. Survivor curves developed from retirement rate studies generally are stub
 21 curves.

SCHEDULE 4. ORIGINAL LIFE TABLE

12.5	323	44	0.1362	0.8638	48.90
13.5	<u>167</u>	<u>26</u>	0.1557	0.8443	42.24
					35.66
Total	<u>44,780</u>	<u>1,606</u>			

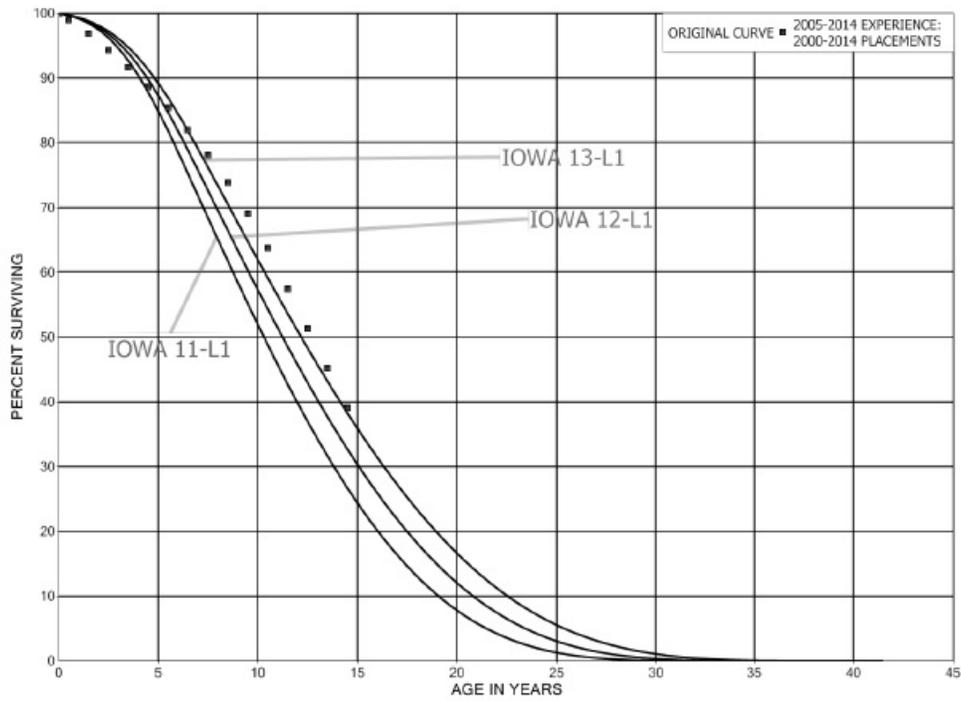

Column 2 from Schedule 3, Column 12, Plant Exposed to Retirement. Column 3 from Schedule 1, Column 12, Retirements for Each Year. Column 4 = Column 3 divided by Column 2. Column 5 = 1.0000 minus Column 4. Column 6 = Column 5 multiplied by Column 6 as of the Preceding Age Interval.

- 1
- 2 **Q. Please explain the process of smoothing the original survivor curve.**
- 3 A. The smoothing of the original survivor curve eliminates any irregularities and serves as
- 4 the basis for the preliminary extrapolation to zero percent surviving of the original stub
- 5 curve. Even if the original survivor curve is complete from 100% to zero percent, it is
- 6 desirable to eliminate any irregularities, as there is still an extrapolation for the vintages
- 7 which have not yet lived to the age at which the curve reaches zero percent. In this study,
- 8 the smoothing of the original curve with established type curves was used to eliminate
- 9 irregularities in the original curve.

1 The Iowa type curves are used in this study to smooth those original stub curves which
2 are expressed as percents surviving at ages in years. Each original survivor curve was compared
3 to the Iowa curves using visual and mathematical matching in order to determine the better
4 fitting smooth curves. In Figures 6, 7, and 8, the original curve developed in Schedule 4 is
5 compared with the L, S, and R Iowa type curves which most nearly fit the original survivor
6 curve. In Figure 6, the L1 curve with an average life between 12 and 13 years appears to be the
7 best fit. In Figure 7, the S0 type curve with a 12-year average life appears to be the best fit and
8 appears to be better than the L1 fitting. In Figure 8, the R1 type curve with a 12-year average
9 life appears to be the best fit and appears to be better than either the L1 or the S0.

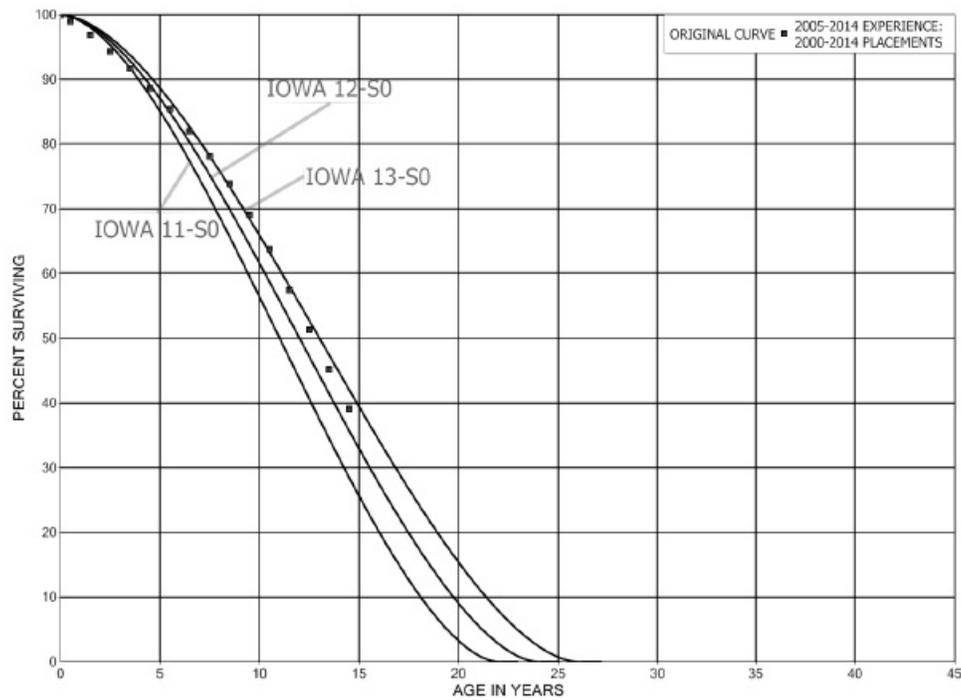

10 In Figure 9, the three fittings, 12-L1, 12-S0 and 12-R1 are drawn for comparison
11 purposes. It is probable that the 12-R1 Iowa curve would be selected as the most representative
12 of the plotted survivor characteristics of the group.

Ms. Sheri Young
Secretary of the Board
National Energy Board
517 10th Avenue SW
Calgary, Alberta
T2R 0A8

**Re: RH-002-2014
Alliance Pipeline Ltd. as General Partner of the Alliance Pipeline Limited Partnership
Application Pursuant to Part IV of the *National Energy Board Act* for Approval of New
Services and related Tolls and Tariffs for Services on the Alliance Pipeline
NEB File Number: OF-Tolls-Group1-A159-2014 01
Depreciation Study Filing and Reserve Account Termination**

Dear Ms. Young

In accordance with Condition 14 of National Energy Board Order TG-012-2015 issued on June 24, 2015 in conjunction with the Board's RH-002-2014 Reasons for Decision, and Board directives contained within that Decision,¹ Alliance Pipeline Ltd., as General Partner of the Alliance Pipeline Limited Partnership, (Alliance) hereby submits for approval a depreciation study, and concurrently requests that its associated reserve account be terminated.

On October 7, 2015, Alliance submitted a report to the Board that established a schedule of baseline distributions in compliance with Condition 13 of Board Order TG-012-2015. Alliance also advised the Board that to the extent that Alliance's pre-tax distributions in any year exceed the applicable baseline pre-tax distribution amount, the variance would be held in a reserve account, pending the filing for Board approval of a depreciation study.

Alliance retained Gannett Fleming Canada ULC (Gannett Fleming) to conduct a depreciation study, which was based on Alliance's natural gas transmission assets as of December 31, 2014 (see Attachment 1). The resulting depreciation rates were based on the straight line method using the average service life procedure, applied on a remaining life basis. The study adopted an economic planning horizon ending December 31, 2034, reflecting current economic parameters representing the constraints impacting the overall pipeline life. Also attached to this submission is a natural gas supply and demand analysis conducted internally by Alliance, which supports this economic planning horizon approach (see Attachment 2). The resultant depreciation rate applicable to Alliance's Total Transmission Plant was 2.77%, with an overall composite depreciation rate of 2.75%.

¹ NEB RH-002-2014 Reasons for Decision, Chapter 8.1.1, page 73.

The results of the Gannett Fleming study were then updated to reflect Alliance's natural gas transmission assets as of December 31, 2015 (see Attachment 3). Utilizing the Original Cost of assets at December, 31, 2015, Future Accruals were adjusted to reflect the net book value of assets as of December 31, 2015. The Composite Remaining Life was adjusted by one year. For each account, the Annual Depreciation amount was calculated by dividing the Future Accruals amount by the corresponding Composite Remaining Life quantity. Likewise, each Annual Accrual Rate was calculated by dividing the Annual Depreciation amount by the corresponding Original Cost. Accordingly, as a result of this analysis, the overall composite depreciation rate applicable to the Alliance system, as of January 1, 2016, is 2.70%.

In its RH-002-2014 Reasons for Decision, the Board noted that Alliance's decrease in its depreciation rate to 2.8% was not supported by a depreciation study. Prior to making any distributions from its reserve account, the Board stated that Alliance must file for approval, a depreciation study to support its proposed depreciation rate. The Board further stated that if the study indicates that the applied-for rate is appropriate, Alliance may distribute any excess returns, including any reserve balances.² The attached depreciation study demonstrates that the applied-for rate is appropriate, and furthermore, substantiates that there certainly is no argument to increase the depreciation rate on a go-forward basis. Consequently, the reserve account no longer serves any purpose, and should be allowed to terminate.

Requested Relief

Alliance Pipeline Ltd., in its capacity as the General Partner of Alliance Pipeline Limited Partnership, hereby applies to the Board for an Order pursuant to Part IV of the *National Energy Board Act* approving its attached depreciation study and the associated composite depreciation rate of 2.70%, as well as the termination of its reserve account.

Please contact the undersigned if you have any questions.

Sincerely,

ALLIANCE PIPELINE LTD.

Attention: Mr. Neil Coghlan,
Controller

Pursuant to your request, we have conducted a depreciation study related to natural gas transmission pipeline assets of Alliance Pipeline Limited Partnership as of December 31, 2014. Our report presents a description of the methods used in the estimation of depreciation, the analyses undertaken to estimate the equal life group of the asset groups, and the summary and detailed tabulations of annual and accrued depreciation.

The calculated annual depreciation accrual rates presented in the report are applicable to plant in service assets as of December 31, 2014. The depreciation rates are based on the straight-line method, average service life procedure applied on a remaining life basis. An annual review of the depreciation rates using the same estimates and methods is recommended.

Respectfully submitted,

GANNETT FLEMING CANADA ULC

**ALLIANCE PIPELINE LIMITED PARTNERSHIP
 DEPRECIATION STUDY**

EXECUTIVE SUMMARY

Pursuant to Alliance Pipeline Limited Partnership’s (“Alliance” or the “Company”) request, Gannett Fleming Canada ULC (“Gannett Fleming”) conducted a depreciation study related to the natural gas transmission (“transmission”) assets as of December 31, 2014. The purpose of this study was to determine the annual depreciation accrual rates and amounts for regulatory objectives.

The depreciation rates are based on the straight line method using the Average Service Life (“ASL”) procedure and were applied on a remaining life basis. The calculations were based on attained ages and estimated average service life, and forecasting net salvage characteristic for each depreciable group of assets. Variances between the calculated accrued depreciation and the book accumulated depreciation as of December 31, 2014 are amortized over the remaining life of assets.

This study has adopted an economic planning horizon ending December 31, 2034, which reflects the current economic parameters representing the constraints impacting the overall pipeline life.

Gannett Fleming recommends the calculated annual depreciation accrual rates set forth herein apply specifically to transmission plant in service as of December 31, 2014 as summarized by Table 1 of the study by account detail. Supporting data and calculations are provided as well within the study.

Finally, this study results in an annual depreciation expense accrual of \$63.4 million when applied to depreciable plant balances as of December 31, 2014. The study results are summarized at an aggregate functional group level as follows:

SUMMARY OF ORIGINAL COST, ACCRUAL PERCENTAGES AND AMOUNTS

PLANT GROUP (1)	ORIGINAL COST	ANNUAL ACCRUAL	
	\$'s (2)	%'s (3)	\$'s (4)
TRANSMISSION	2,289,058,915	2.77	63,412,367
OTHER ACCOUNTS	458,795,870	2.65	12,163,315
TOTAL PLANT IN SERVICE	2,747,854,785	2.75	75,575,682

PART I. INTRODUCTION

ALLIANCE PIPELINE LIMITED PARTNERSHIP
DEPRECIATION STUDY
PART I. INTRODUCTION

SCOPE

This report sets forth the results of the depreciation study for Alliance Pipeline Limited Partnership, to determine the annual depreciation accrual rates and amounts for regulatory purposes applicable to the original cost of transmission plant at December 31, 2014. The rates and amounts are based on the straight line, remaining life method of depreciation. This report also describes the concepts, methods and judgments which underlie the recommended annual depreciation accrual rates related to plant in service as of December 31, 2014.

The service life estimates resulting from the study were based on: informed engineering judgment which incorporated analyses of historical plant retirement data as recorded through December 31, 2014; a review of Company practice and outlook as they relate to plant operation and retirement; and consideration of current practice in the gas industry, including knowledge of service lives used for other large diameter transmission pipeline companies.

PLAN OF REPORT

Part I. Introduction, contains statements with respect to the plan of the report, and the basis of the study. Part II. Development of Depreciation Parameters, presents descriptions of the methods used in the service life and net salvage studies. Part III. Calculation of Annual and Accrued Depreciation presents the methods and procedures used in the calculation of depreciation. Part IV. Results of Study, presents summaries by depreciable group of annual and accrued depreciation. Part V. Detail Depreciation Calculations presents the detailed tabulations of annual and accrued depreciation.

BASIS OF THE STUDY

Depreciation

For most accounts, the annual and accrued depreciation were calculated by the straight line method using the ASL procedure applied on a remaining life basis. All types

of calculations were based on original cost, attained ages, and estimated service lives as of December 31, 2014.

The straight line method, ASL procedure is a commonly used depreciation calculation procedure that has been widely accepted in jurisdictions throughout North America. Gannett Fleming recommends its continued use for regulatory purposes.

Service Life Estimates

The service life estimates used in the depreciation and amortization calculations were based on informed judgment which incorporated a review of management's plans, policies and outlook, a general knowledge of the natural gas transmission pipeline industry, and comparisons of the service life estimates from our studies of other large diameter transmission pipelines. The use of survivor curves to reflect the expected dispersion of retirement provides a consistent method of estimating depreciation for gas plant. Iowa type survivor curves were used to depict the estimated survivor curves for the plant accounts not subject to amortization accounting.

The procedure for estimating service lives consisted of compiling historical data for the plant accounts or depreciable groups, analyzing this history through the use of widely accepted techniques, and forecasting the survivor characteristics for each depreciable group on the basis of interpretations of the historical data analyses and the probable future. The combination of the historical experience and the estimated future yielded estimated survivor curves from which the average service lives were derived.

The depreciation rates should be reviewed periodically to reflect the changes that result from plant and accumulated depreciation account activity. A depreciation reserve deficiency or surplus will develop if future capital expenditures vary significantly from those anticipated in this study.

PART II. DEVELOPMENT OF DEPRECIATIONS PARAMETERS

PART II. DEVELOPMENT OF DEPRECIATION PARAMETERS

DEPRECIATION

Depreciation, in public utility regulation, is the loss in service value not restored by current maintenance, incurred in connection with the consumption or prospective retirement of utility plant in the course of service from causes which are known to be in current operation and against which the utility is not protected by insurance. Among causes to be given consideration are wear and tear, deterioration, action of the elements, inadequacy, obsolescence, changes in the art, changes in demand, and the requirements of public authorities.

Depreciation, as used in accounting, is a method of distributing fixed capital costs, less net salvage, over a period of time by allocating annual amounts to expense. Each annual amount of such depreciation expense is part of that year's total cost of providing gas transportation service. Normally, the period of time over which the fixed capital cost is allocated to the cost of service is equal to the period of time over which an item renders service, that is, the item's service life. The most prevalent method of allocation is to distribute an equal amount of cost to each year of service life. This method is known as the straight-line method of depreciation.

The calculation of annual and accrued depreciation based on the straight line method requires the estimation of survivor curves and is described in the following sections of this report. The development of the proposed depreciation rates also requires the selection of appropriate depreciation procedures, as discussed in Part III of this report.

ESTIMATION OF SURVIVOR CURVES

Survivor Curves

The use of an average service life for linear pipelines recognizes that assets within the property accounts that can have different lives. Thus, the average life may be obtained by determining the separate lives of each of the units, or by constructing a survivor curve by plotting the number of units which survive at successive ages using the retirement rate method of analysis.

The range of survivor characteristics usually experienced by utility and industrial properties is encompassed by a system of generalized survivor curves known as the Iowa type curves. There are four families in the Iowa system, labeled in accordance with the location of the modes of the retirements in relationship to the average life and relative height of the modes. The left-moded curves are those in which the greatest frequency of retirement occurs to the left of, or prior to, average service life. The symmetrical-moded curves are those in which the greatest frequency of retirement occurs at average service life. The right-moded curves are those in which the greatest frequency occurs to the right of, or after, the average service life. The origin-moded curves are those in which the greatest frequency of retirement occurs at the origin, or immediately after age 0. The letter designation of each family of curves (L, S, R or O) represents the mode of the associated frequency curve with respect to the average service life. The numerical subscripts represent the relative heights of the modes of the frequency curves within each family.

A discussion of the general concept of survivor curves and the retirement rate method is presented in Appendix A of this report.

Survivor Curve Judgments

The survivor curve estimates were based on judgment which considered a number of factors. The primary factors were the statistical analysis of data; current policies and outlook as determined during conversations with management personnel and on the knowledge Gannett Fleming developed through the completion of numerous electric utility studies.

The following discussion, dealing with a number of accounts which comprise the majority of the investment analyzed, presents an overview of the factors considered by Gannett Fleming in the determination of the average service life estimates. The survivor curve estimates for the remainder of the accounts not discussed in the following sections were based on similar considerations.

The following were the peer group of companies reviewed in order to develop average service life estimates:

- TransCanada Pipelines Limited;

- Kinder Morgan;
- Enbridge Pipelines Inc.; and
- FortisBC Energy Inc.

The above companies were considered as peer companies on the basis of the following criteria:

- All have had depreciation studies recently completed by Gannett Fleming. As such Gannett Fleming is familiar with the physical plant, operating circumstances and management policies affecting depreciation for each company;
- All are large diameter, regulated, long haul pipelines; and
- All have a significant level of retirement experience for which studies of actual historic retirement transactions were made.

Following is a specific discussion of the factors considered in the determination of the average service life for the accounts with significant amounts of investment.

Account 465.00 – Mainline Pipe - This account represents 63.7% of the depreciable plant as of December 31, 2014. The average service life indication for this account recognized the indications from the Pipeline Integrity and Corridor Management group which provided information regarding the increased standards of the Alliance pipe as compared to the peer industry installations. The pipeline was built to an increased standard due to the requirement to operate at a higher than normal operating pressure.

The National Energy Board of Canada (“NEB”) required that Alliance, like all new large diameter pipelines, complete a baseline pigging program within five years of being placed into service. Additionally, the pipeline is subjected to a five to seven year inspection pigging cycle in the periods following the baseline inspection. Given the original in-service date of 2000, this aggressive inspection pigging program is very proactive in nature. It is also noted that the inspection programs are completed using high resolution inspection tools.

The technology and materials employed in the milling of the pipe employed state of the art processes. The testing of the pipe at the time of construction was far more extensive than the testing required of the pipe installed by other peer large diameter pipelines. The increased testing and more aggressive pigging inspection programs are

a result of the higher operating pressure of the Alliance system as compared to historic natural gas transmission pipelines.

Given the system integrity programs, the increased testing requirements at the time of the Alliance pipe manufacture, and the proactive pipe inspection program, Gannett Fleming recommends the use of a 70 average service life. Additionally Gannett Fleming views that the Iowa R4 retirement dispersion curve is appropriate. Therefore, Gannett Fleming has incorporated the use of the Iowa 70-R4 curve into the depreciation rate calculations for this account.

Account 466.00 – Compressor - This account represents 16.2% of the depreciable plant as of December 31, 2014. The average service life indication for this account was based on the comments of the internal operating staff, and on the experience of Gannett Fleming in the selection of compression average service life estimates for the peer group of companies. The Alliance system is comprised of two distinct compressing functions. Firstly, the “field compression” which is comprised of a mix of reciprocating and turbine equipment to bring the receipt pressure up to 1,250 psi. Over the past 15 years of operating history, some of the reciprocating equipment has required replacement. The view of the operating staff is that field compression equipment would have a life expectancy of 30 years.

In addition to the field compression equipment, the Alliance system includes a number of “mainline compressors” which increase the operating pressure from 1,250 psi to 1,760 psi. This equipment is all driven by turbine engines that run at or above capacity. While this equipment has shown to be reliable to date, it is subjected to on-going inspections every 4,000 operating hours, with larger inspections undertaken at 8,000 hours. Additionally, the equipment is overhauled every 16,000 to 24,000 hours. It is the view of the operating staff that this mainline compression equipment should have a life expectancy of at least 35 years. Based on the experience of Gannett Fleming and the views of the internal Alliance operating staff, an Iowa 35-R2.5 is recommended for this account.

Account 469.10 – Lateral Pipe - This account represents 11.7% of the depreciable plant as of December 31, 2014. This pipe is typically smaller in diameter and of shorter length used as receipt and delivery laterals. Most investment in this

account relates to approximately 730 km of lateral pipelines connected to 52 natural gas receipt locations, primarily at gas processing facilities in northwestern Alberta and northeastern British Columbia.

The average service life of laterals is shorter than that used for the mainline pipe. Laterals are subject to the natural gas supply of the specific supply source or delivery market. The smaller diameter lateral pipe is also not internally inspected and subjected to an increased number of forces of retirement.

Given the increased number of forces of future retirement of laterals, combined with the experience of the broader group of peer pipelines, Gannett Fleming views that the lowa 50-R2 is appropriate at this time.

Account 467.00 – Meter Station - This account represents 2.3% of the depreciable plant as of December 31, 2011 and relates to the assets at both the receipt and delivery points. Booster compression equipment is also included in this account at five receipt points. The metering within the Alliance system is completely comprised of ultra-sonic equipment. To date the heads on the ultra-sonic meters have required replacement. Alliance has received a waiver of the requirement of Measurement Canada Standard S.S.06 which will allow for a reduced frequency of testing and proving of the meters. The internal Alliance metering staff has indicated an expected life expectancy of 35 years.

Given that the entire fleet is comprised of ultra-sonic meters, and that Alliance is subjected to less frequent testing, Gannett Fleming view is that an average service life that is on the long side of the peer pipeline group is reasonable. Therefore, Gannett Fleming recommends the lowa 35-R2.5 for this account.

Remaining Accounts - The above analysis provides the consideration relating to almost 94% of the depreciable plant. The analysis of the accounts relating to the remaining 6% of the investment as of December 31, 2014 considered a similar review of operational comments, peer reviews and experience of Gannett Fleming.

Economic Planning Horizon

The service life of the Alliance Pipeline Limited Partnership assets is restricted not only by physical forces of retirement such as wear and tear and deterioration, but

also, and more significantly, by economic forces of retirement. Generally, physical forces of retirement are less likely to occur than retirement of large portions of the pipeline system due to economic forces. Specifically, the economic exhaustion of natural gas supply, the changing North American marketplace for natural gas demand, and the competitive influences in the Western Canada Sedimentary Basin have a significant impact on the estimated service lives of the Alliance system.

The concept referred to with the terms “economic life” or “economic planning horizon” or “truncation date” (which has similar meaning within depreciation literature) is the key parameter used to set appropriate depreciation rates that accurately reflect the annual consumption in service value. Appropriate depreciation rates also help to ensure that both long term generational equity and a reasonable opportunity for the recovery of investment are achievable, over the expected useful life of the pipeline assets.

The economic planning horizon for a system comprised of one large single asset, is generally set to a single date that represents the estimated end of the planning horizon (or economic life) of the entire system. Gannett Fleming views that the determination of the anticipated economic life of large diameter transmission pipelines can be based on a number of different factors. While these factors are criteria for the development of an economic planning horizon from a theoretical standpoint, it is important to note that not all factors affecting economic life may be relevant to every transmission pipeline. Generally, the appropriate economic life is developed from the merger of a number of these factors.

Gannett Fleming views that the following are appropriate factors to consider in determining an economic planning horizon for large diameter transmission pipelines:

1. Availability of supply to the pipeline;
2. Availability of market demand;
3. Consumption of service value;
4. Engineering based retirement studies;
5. Competitiveness of the pipeline;
6. Opportunity for the recovery of the investment;
7. Projected long term use of the pipeline;
8. Approved economic planning horizons of peer companies; and

9. Management discretion.

When consideration is given to the use of the above factors, whether individually considered or reviewed in combinations, it is critical to note that the overall goal of inclusion of economic life considerations in the development of depreciation rates is to provide for a reasonable assurance of recovery of invested capital proportionally from those using the pipeline system, and over the expected useful life of the pipeline.

The Alliance pipeline system was originally approved by the NEB, with an estimated economic life of 25 years. As such, the original contractual agreements and transportation tolls were developed on the assumption of a 25-year economic life.

A supply and market demand study undertaken by Alliance as part of this depreciation study has not indicated that it is likely that the Alliance system will be uneconomic after the year 2025. While it is currently anticipated that the system will be contracted for service through contract renewals and will be competitive with other natural gas pipelines sourcing supply from the Western Canadian Sedimentary Basin for the next 20-year period, however, the contracting circumstances beyond 2034 are not known. Therefore, an economic planning horizon extending beyond 2034 is not reasonable.

The depreciation rates of most federally regulated North American transmission pipelines have recognized the economic influences in the determination of the remaining lives of the systems. Over a period through 1999 most regulators have approved a 25-year planning horizon into the depreciation rates. As such, the concept of planning horizons was widely used for regulatory purposes.

It is the view of Gannett Fleming that recognition of an economic life must be incorporated into the depreciation rates of Alliance. The planning horizon is meant to indicate the average date of significant terminal pipeline retirement. As this date is based on an average of the expected retirement of significant portions of the pipeline system, the planning horizon is not the expected date of cessation of natural gas transportation service on the Alliance Pipeline. For example, it may be expected that not all of the mainline compressors or compression equipment will retire at one time due to economic conditions. Rather a pattern of rationalization of compression equipment developed in the future based on the facts and circumstances at that time may be the

most reasonable approach. As such, a significant portion of the compression equipment may terminally retire prior to the planning horizon date and a significant portion may retire after. However, the planning horizon represents a reasonable average expectation at this time.

Based on the review of the criteria discussed above, Gannett Fleming views that the economic planning horizon developed internally by Alliance is reasonable. Therefore, Gannett Fleming recommends the incorporation of a 20-year planning horizon into the depreciation rate calculations. Additionally, Gannett Fleming recommends that Alliance monitor the recovery of its investment in this line in order that subsequent capital additions are fully recovered through the period ending over which the investment provides service to the customer. The planning horizon is incorporated in the estimated survivor characteristics by truncating the survivor curve which represents the physical life of the facilities at the attained age of each vintage as of December 31, 2034.

PART III. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

PART III. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

Group Depreciation Procedures

When more than a single item of property is under consideration, a group procedure for depreciation is appropriate because normally all of the items within a group do not have identical service lives, but have lives that are dispersed over a range of time. There are two primary group procedures, namely, the average service life and equal life group procedures.

In the average service life procedure, the rate of annual depreciation is based on the average service life of the group, and this rate is applied to the surviving balances of the group's cost. A characteristic of this procedure is that the cost of plant retired prior to average life is not fully recouped at the time of retirement, whereas the cost of plant retired subsequent to the average life is more than fully recouped. Over the entire life cycle, the portion of cost not recouped prior to average life is balanced by the cost recouped subsequent to average life.

In the Equal Life Group ("ELG") procedure, the property group is subdivided according to service life. That is, each equal life group includes that portion of the property which experiences the life of that specific group. The relative size of each equal life group is determined from the property's life dispersion curve. The calculated depreciation for the property group is the summation of the calculated depreciation based on the service life of each equal life group.

In the determination of the depreciation rates in this study, the use of the average service life procedure has been used. While the equal life group procedure provides an enhanced matching of depreciation expense to the consumption of service value, the average service life procedure is widely used throughout North America and was used in order to conform to past regulatory practices of this company and by other NEB regulated transmission pipelines.

MONITORING OF BOOK ACCUMULATED DEPRECIATION

For the purposes of calculating remaining life accrual rates, the book depreciation reserve for each plant account is allocated among vintages in proportion to the calculated accrued depreciation for the account. The calculated accrued depreciation for each depreciable property group represents that portion of the depreciable cost of the group which would not be allocated to expense through future depreciation accruals if current forecasts of service life characteristics and net salvage materialize and are used as a basis for depreciation accounting.

In the average life group procedure, the remaining life annual accrual for each vintage is determined by dividing future book accruals (original cost less book reserve) by the average remaining life for the surviving original cost of that vintage. The average remaining life is defined by the estimated future survivor curve.

The annual accrual rate for each account is equal to the sum of the remaining life annual accruals divided by the total original cost. The composite remaining life is calculated by dividing the sum of the future book accruals by the sum of the remaining life annual accruals.

PART IV. RESULTS OF STUDY

PART IV. RESULTS OF STUDY

QUALIFICATION OF RESULTS

The calculated annual and accrued depreciation are the principal results of the study. Continued surveillance and periodic revisions are normally required to maintain continued use of appropriate annual depreciation accrual rates. An assumption that accrual rates can remain unchanged over a long period of time implies a disregard for the inherent variability in service lives for the change of the composition of property in service. The annual accrual rates and the accrued depreciation were calculated in accordance with the straight line method, using the equal life group procedure based on estimates which reflect considerations of current historical evidence and expected future conditions.

DESCRIPTION OF DETAILED TABULATIONS

The service life estimates were based on judgment that incorporated statistical analysis of retirement data, discussions with management and consideration of estimates made for other pipelines.

The tables of the calculated annual depreciation applicable to depreciable assets as of December 31, 2014 are presented in account sequence starting on page V-2 of the supporting documents. The tables indicate the estimated average survivor curves used in the calculations. The tables set forth, for each installation year, the original cost, calculated accrued depreciation, and the calculated annual accrual.

APPENDIX A

ESTIMATION OF SURIVOR CURVES

ESTIMATION OF SURVIVOR CURVES

Average Service Life

The use of an average service life for a property group implies that the various units in the group have different lives. Thus, the average life may be obtained by determining the separate lives of each of the units, or by constructing a survivor curve by plotting the number of units which survive at successive ages. A discussion of the general concept of survivor curves is presented. Also, the Iowa type survivor curves are reviewed.

SURVIVOR CURVES

The survivor curve graphically depicts the amount of property existing at each age throughout the life of an original group. From the survivor curve, the average life of the group, the remaining life expectancy, the probable life, and the frequency curve can be calculated. In Figure 1, a typical smooth survivor curve and the derived curves are illustrated. The average life is obtained by calculating the area under the survivor curve, from age zero to the maximum age, and dividing this area by the ordinate at age zero. The remaining life expectancy at any age can be calculated by obtaining the area under the curve, from the observation age to the maximum age, and dividing this area by the percent surviving at the observation age. For example, in Figure 1, the remaining life at age 30 is equal to the crosshatched area under the survivor curve divided by 29.5 percent surviving at age 30. The probable life at any age is developed by adding the age and remaining life. If the probable life of the property is calculated for each year of age, the probable life curve shown in the chart can be developed. The frequency curve presents the number of units retired in each age interval. It is derived by obtaining the differences between the amount of property surviving at the beginning and at the end of each interval.

Iowa Type Curves

The range of survivor characteristics usually experienced by utility and industrial properties is encompassed by a system of generalized survivor curves known as the

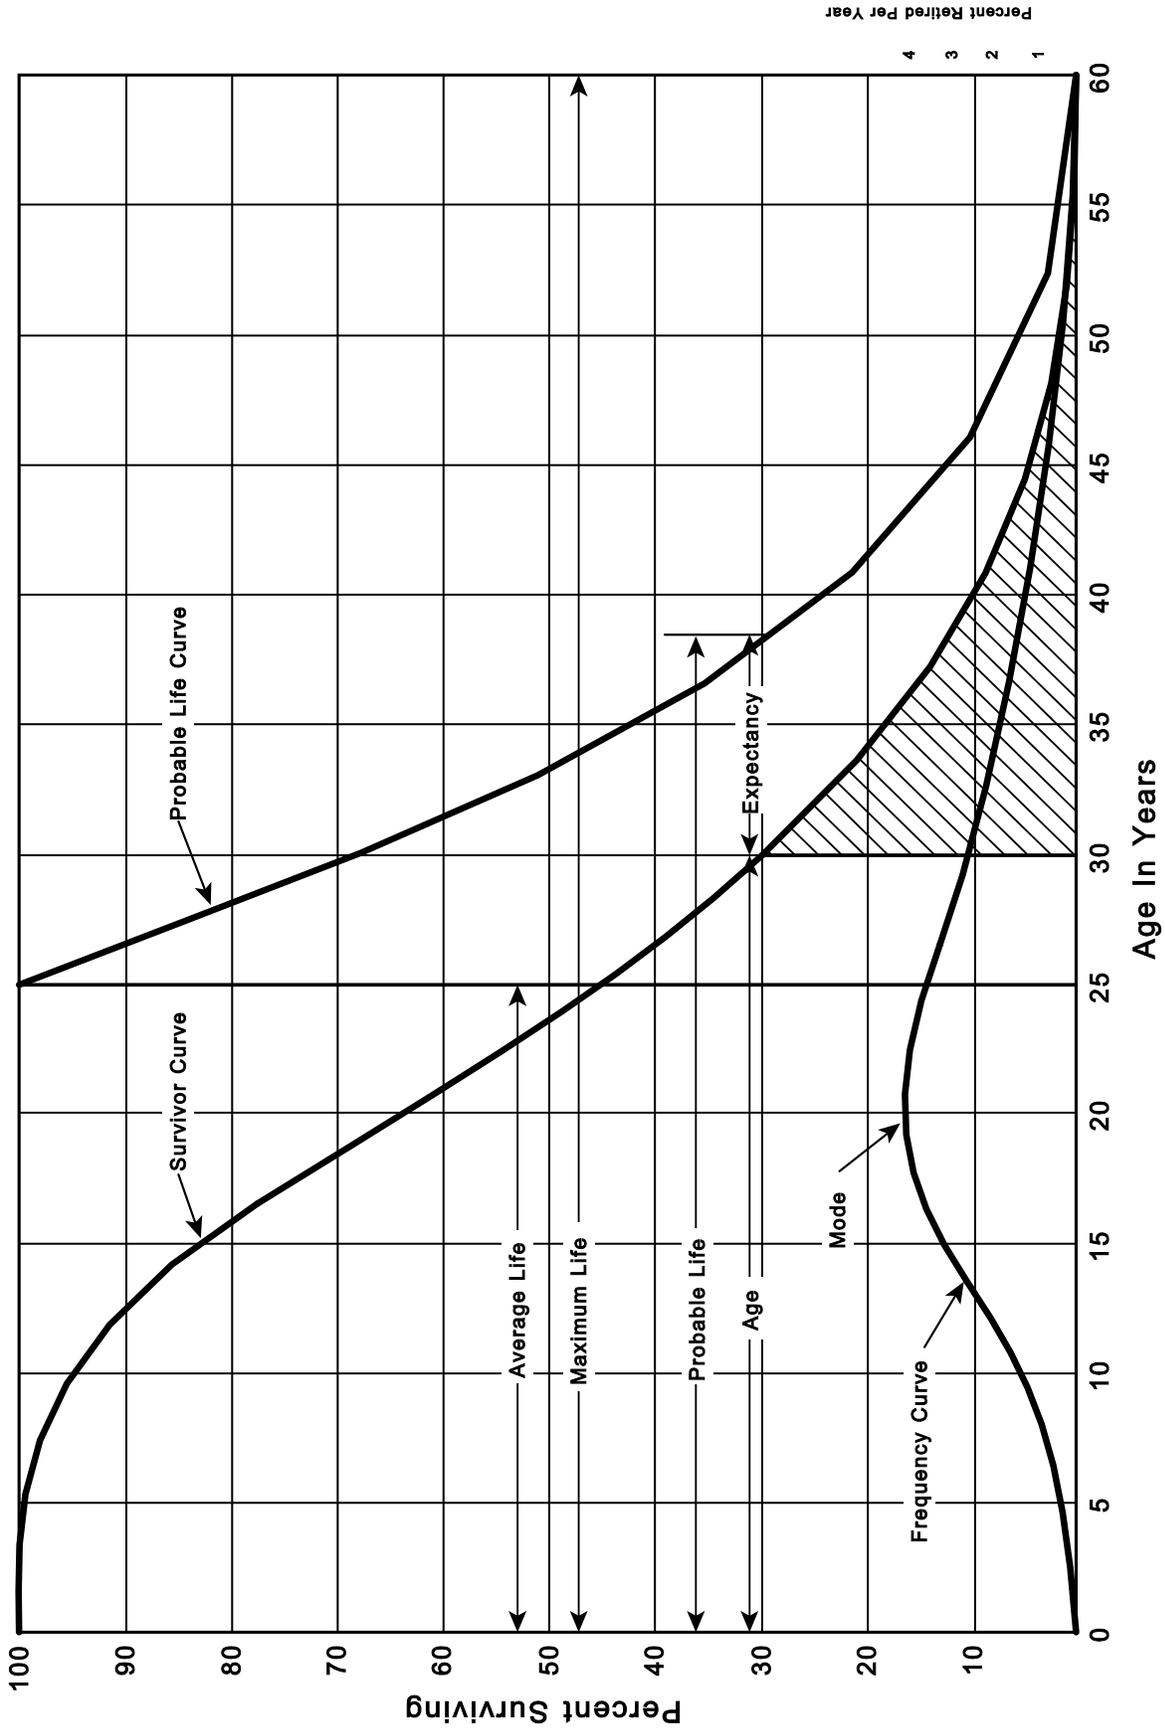

Figure 1. A Typical Survivor Curve and Derived Curves

Iowa type curves. There are four families in the Iowa system, labeled in accordance with the location of the modes of the retirements in relationship to the average life and the relative height of the modes. The left moded curves, presented in Figure 2, are those in which the greatest frequency of retirement occurs to the left of, or prior to, average service life. The symmetrical moded curves, presented in Figure 3, are those in which the greatest frequency of retirement occurs at average service life. The right moded curves, presented in Figure 4, are those in which the greatest frequency occurs to the right of, or after, average service life. The origin moded curves, presented in Figure 5, are those in which the greatest frequency of retirement occurs at the origin, or immediately after age zero. The letter designation of each family of curves (L, S, R or O) represents the location of the mode of the associated frequency curve with respect to the average service life. The numbers represent the relative heights of the modes of the frequency curves within each family.

The Iowa curves were developed at the Iowa State College Engineering Experiment Station through an extensive process of observation and classification of the ages at which industrial property had been retired. A report of the study which resulted in the classification of property survivor characteristics into 18 type curves, which constitute three of the four families, was published in 1935 in the form of the Experiment Station's Bulletin 125.¹ These curve types have also been presented in subsequent Experiment Station bulletins and in the text, "Engineering Valuation and Depreciation."² In 1957, Frank V. B. Couch, Jr., an Iowa State College graduate student, submitted a thesis³ presenting his development of the fourth family consisting of the four O type survivor curves.

Retirement Rate Method of Analysis

The retirement rate method is an actuarial method of deriving survivor curves using the average rates at which property of each age group is retired. The method relates to property groups for which aged accounting experience is available and is the method used to develop the original stub survivor curves in this study. The method (also known as the annual rate method) is illustrated through the use of an example in the following text, and is also explained in several publications, including "Statistical Analyses of Industrial Property Retirements,"⁴ "Engineering Valuation and Depreciation,"⁵ and "Depreciation Systems."⁶

The average rate of retirement used in the calculation of the percent surviving for the survivor curve (life table) requires two sets of data: first, the property retired during a period of observation, identified by the property's age at retirement; and second, the property exposed to retirement at the beginning of the age intervals during the same period. The period of observation is referred to as the experience band, and the band of years which represent the installation dates of the property exposed to retirement during the experience band is referred to as the placement band. An example of the calculations used in the development of a life table follows. The example includes schedules of annual aged property transactions, a schedule of plant exposed to retirement, a life table and illustrations of smoothing the stub survivor curve.

Schedules of Annual Transactions in Plant Records

The property group used to illustrate the retirement rate method is observed for the experience band 2005-2014 during which there were placements during the years 2000-2014. In order to illustrate the summation of the aged data by age interval, the data were compiled in the manner presented in Schedules 1 and 2 on the following pages. In Schedule 1, the year of installation (year placed) and the year of retirement are shown. The age interval during which a retirement occurred is determined from this information. In the example which follows, \$10,000 of the dollars invested in 2000 were

Parentheses Denote Credit Amount.

retired in 2005. The \$10,000 retirement occurred during the age interval between 4½ and 5½ years on the basis that approximately one-half of the amount of property was installed prior to and subsequent to July 1 of each year. That is, on the average, property installed during a year is placed in service at the midpoint of the year for the purpose of the analysis. All retirements also are stated as occurring at the midpoint of a one-year age interval of time, except the first age interval which encompasses only one-half year.

The total retirements occurring in each age interval in a band are determined by summing the amounts for each transaction year-installation year combination for that age interval. For example, the total of \$143,000 retired for age interval 4½-5½ is the sum of the retirements entered on Schedule 1 immediately above the stair step line drawn on the table beginning with the 2005 retirements of 2000 installations and ending with the 2014 retirements of the 2009 installations. Thus, the total amount of 143 for age interval 4½-5½ equals the sum of:

$$10 + 12 + 13 + 11 + 13 + 13 + 15 + 17 + 19 + 20.$$

In Schedule 2, other transactions which affect the group are recorded in a similar manner. The entries illustrated include transfers and sales. The entries which are credits to the plant account are shown in parentheses. The items recorded on this schedule are not totaled with the retirements, but are used in developing the exposures at the beginning of each age interval.

Schedule of Plant Exposed to Retirement

The development of the amount of plant exposed to retirement at the beginning of each age interval is illustrated in Schedule 3 on the following page. The surviving plant at the beginning of each year from 2005 through 2014 is recorded by year in the portion of the table headed "Annual Survivors at the Beginning of the Year." The last amount entered in each column is the amount of new plant added to the group during the year. The amounts entered in Schedule 3 for each successive year following the beginning balance or addition, are obtained by adding or subtracting the net entries

^a Additions during the year.

shown on Schedules 1 and 2. For the purpose of determining the plant exposed to retirement, transfers-in are considered as being exposed to retirement in this group at the beginning of the year in which they occurred, and the sales and transfers-out are considered to be removed from the plant exposed to retirement at the beginning of the following year. Thus, the amounts of plant shown at the beginning of each year are the amounts of plant from each placement year considered to be exposed to retirement at the beginning of each successive transaction year. For example, the exposures for the installation year 2006 are calculated in the following manner:

Exposures at age 0	= amount of addition	= \$750,000
Exposures at age ½	= \$750,000 - \$ 8,000	= \$742,000
Exposures at age 1½	= \$742,000 - \$18,000	= \$724,000
Exposures at age 2½	= \$724,000 - \$20,000 - \$19,000	= \$685,000
Exposures at age 3½	= \$685,000 - \$22,000	= \$663,000

For the entire experience band 2005-2014, the total exposures at the beginning of an age interval are obtained by summing diagonally in a manner similar to the summing of the retirements during an age interval (Schedule 1). For example, the figure of 3,789, shown as the total exposures at the beginning of age interval 4½-5½, is obtained by summing:

$$255 + 268 + 284 + 311 + 334 + 374 + 405 + 448 + 501 + 609.$$

Original Life Table

The original life table, illustrated in Schedule 4 on the following page, is developed from the totals shown on the schedules of retirements and exposures, Schedules 1 and 3, respectively. The exposures at the beginning of the age interval are obtained from the corresponding age interval of the exposure schedule, and the retirements during the age interval are obtained from the corresponding age interval of the retirement schedule. The retirement ratio is the result of dividing the retirements during the age interval by the exposures at the beginning of the age interval. The percent surviving at the beginning of each age interval is derived from survivor ratios, each of which equals one minus the retirement ratio. The percent surviving is developed by starting with 100% at age zero and successively multiplying the percent

					35.66
Total	<u>44,780</u>	<u>1,606</u>			

Column 2 from Schedule 3, Column 12, Plant Exposed to Retirement.

Column 3 from Schedule 1, Column 12, Retirements for Each Year.

Column 4 = Column 3 divided by Column 2.

Column 5 = 1.0000 minus Column 4.

Column 6 = Column 5 multiplied by Column 6 as of the Preceding Age Interval.

surviving at the beginning of each interval by the survivor ratio, i.e., one minus the retirement ratio for that age interval. The calculations necessary to determine the percent surviving at age 5½ are as follows:

Percent surviving at age 4½	=	88.15	
Exposures at age 4½	=	3,789,000	
Retirements from age 4½ to 5½	=	143,000	
Retirement Ratio	=	143,000 ÷ 3,789,000	= 0.0377
Survivor Ratio	=	1.000 - 0.0377	= 0.9623
Percent surviving at age 5½	=	(88.15) x (0.9623)	= 84.83

The totals of the exposures and retirements (columns 2 and 3) are shown for the purpose of checking with the respective totals in Schedules 1 and 3. The ratio of the total retirements to the total exposures, other than for each age interval, is meaningless. The original survivor curve is plotted from the original life table (column 6, Schedule 4). When the curve terminates at a percent surviving greater than zero, it is called a stub survivor curve. Survivor curves developed from retirement rate studies generally are stub curves.

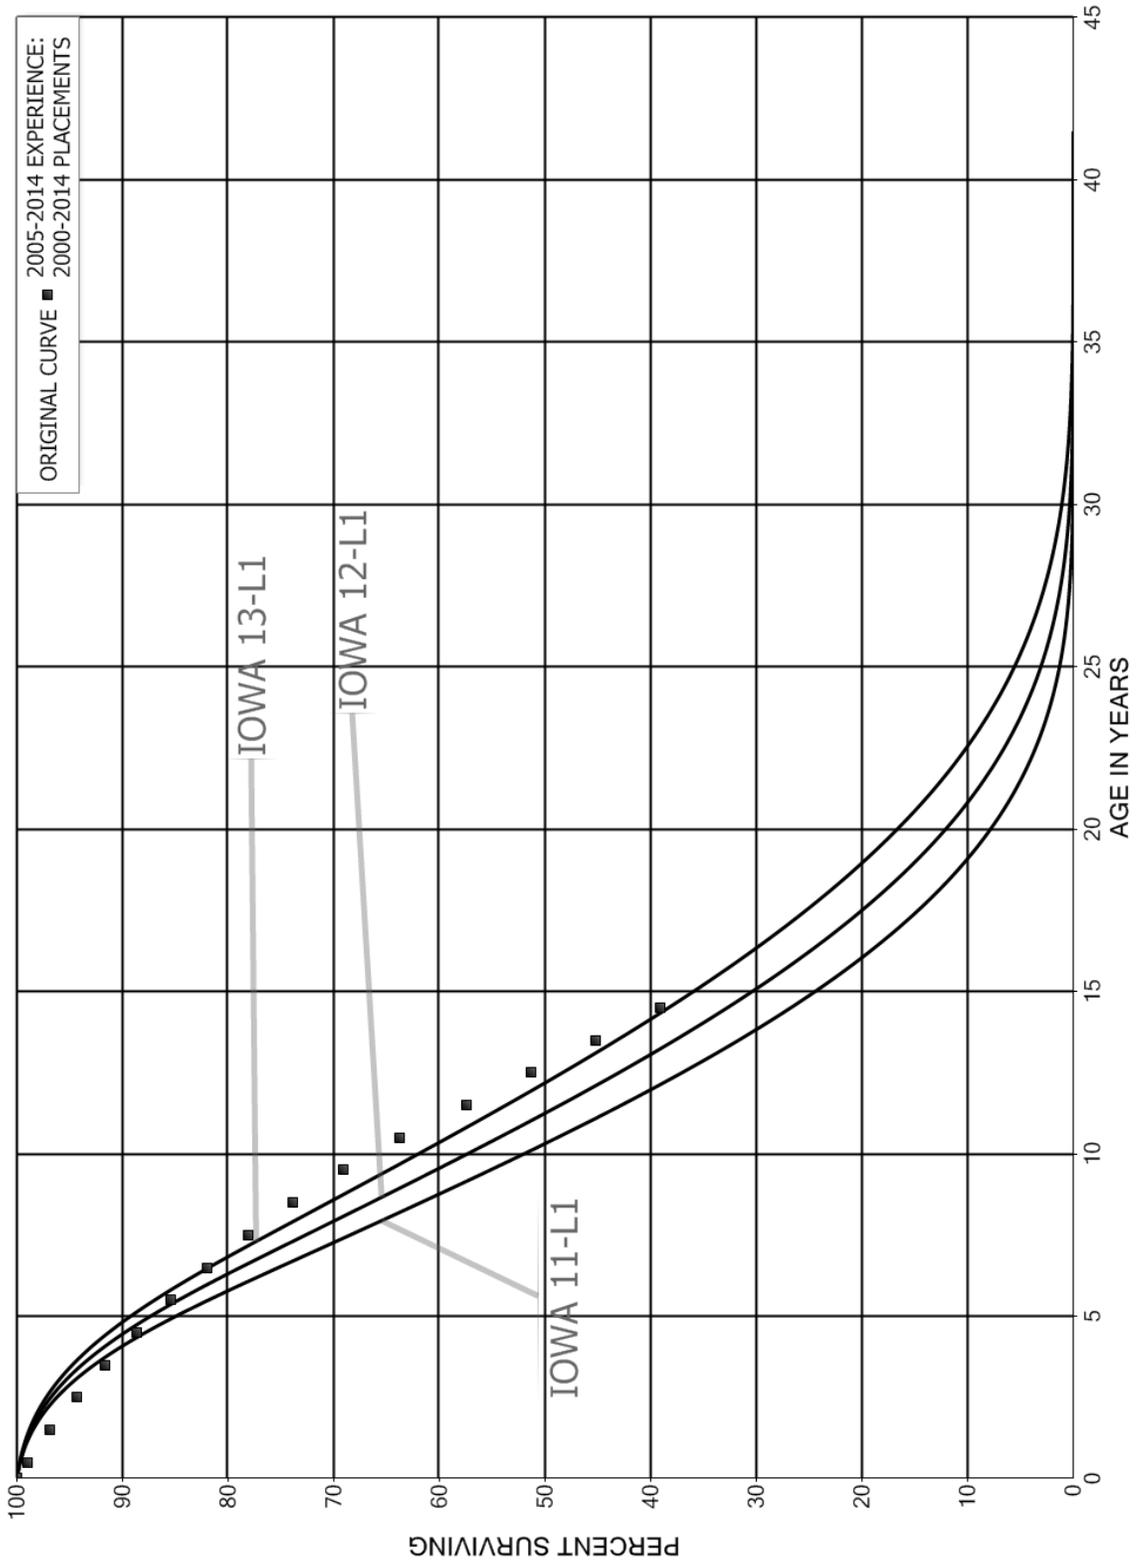

Smoothing the Original Survivor Curve

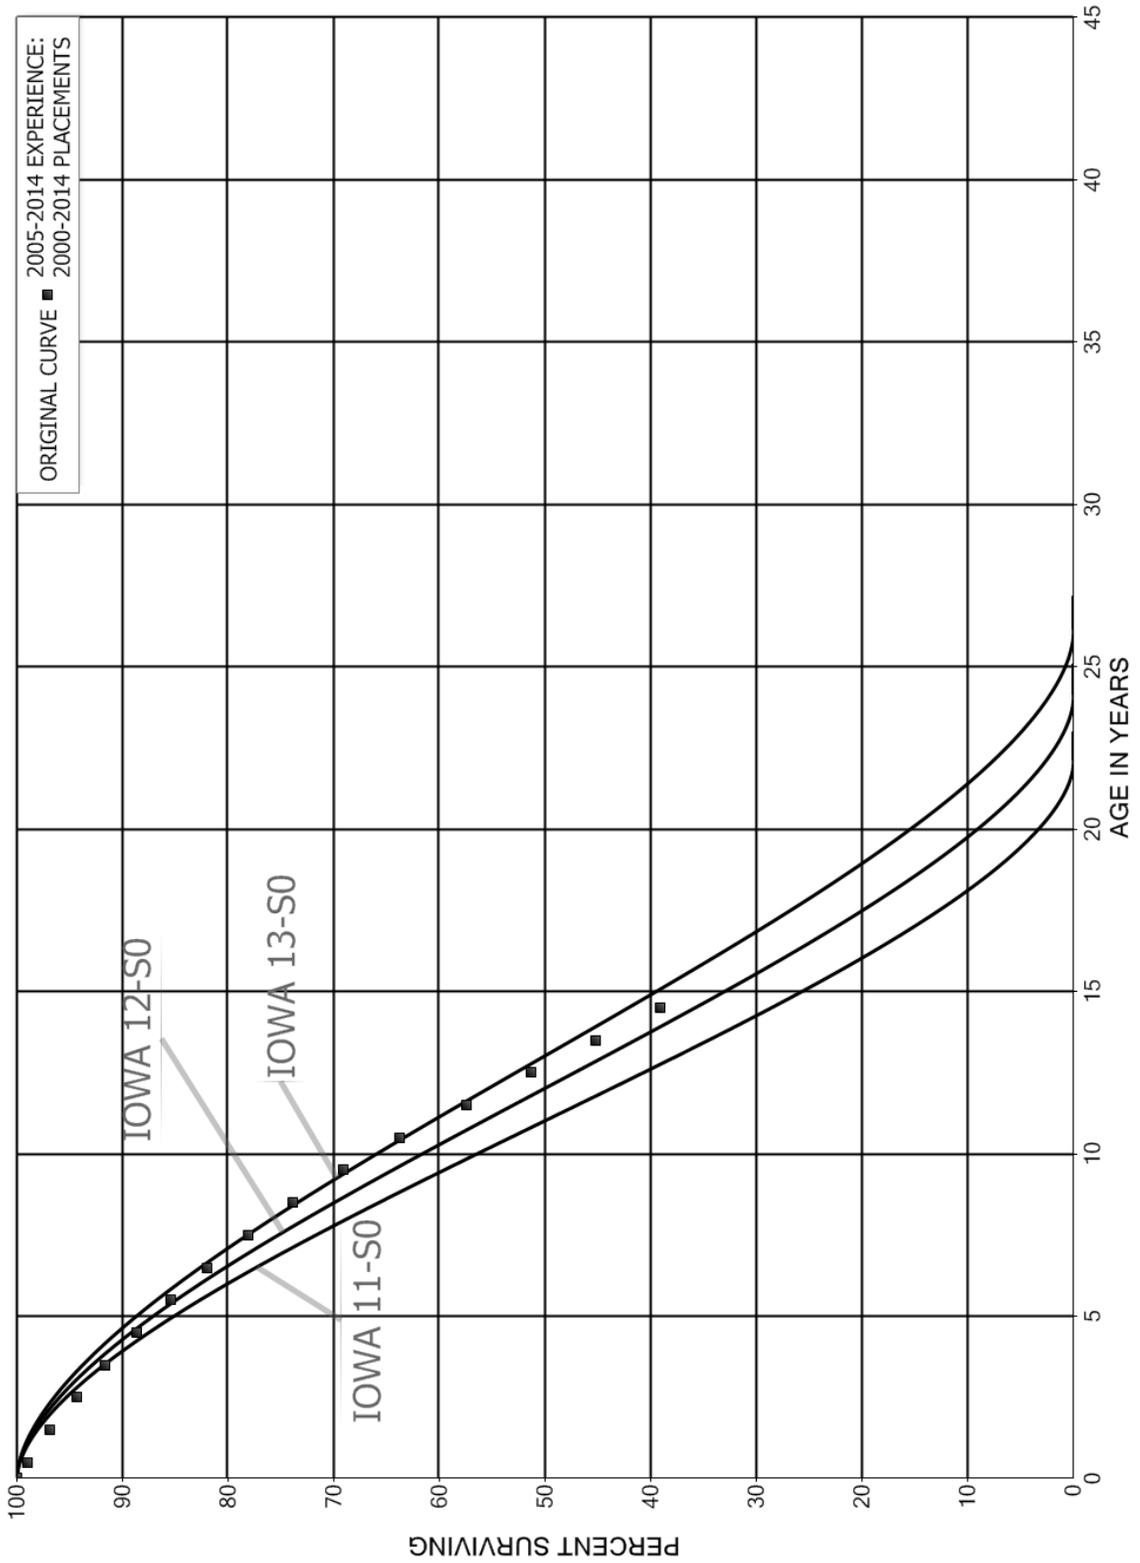

The smoothing of the original survivor curve eliminates any irregularities and serves as the basis for the preliminary extrapolation to zero percent surviving of the original stub curve. Even if the original survivor curve is complete from 100% to zero percent, it is desirable to eliminate any irregularities, as there is still an extrapolation for the vintages which have not yet lived to the age at which the curve reaches zero percent. In this study, the smoothing of the original curve with established type curves was used to eliminate irregularities in the original curve.

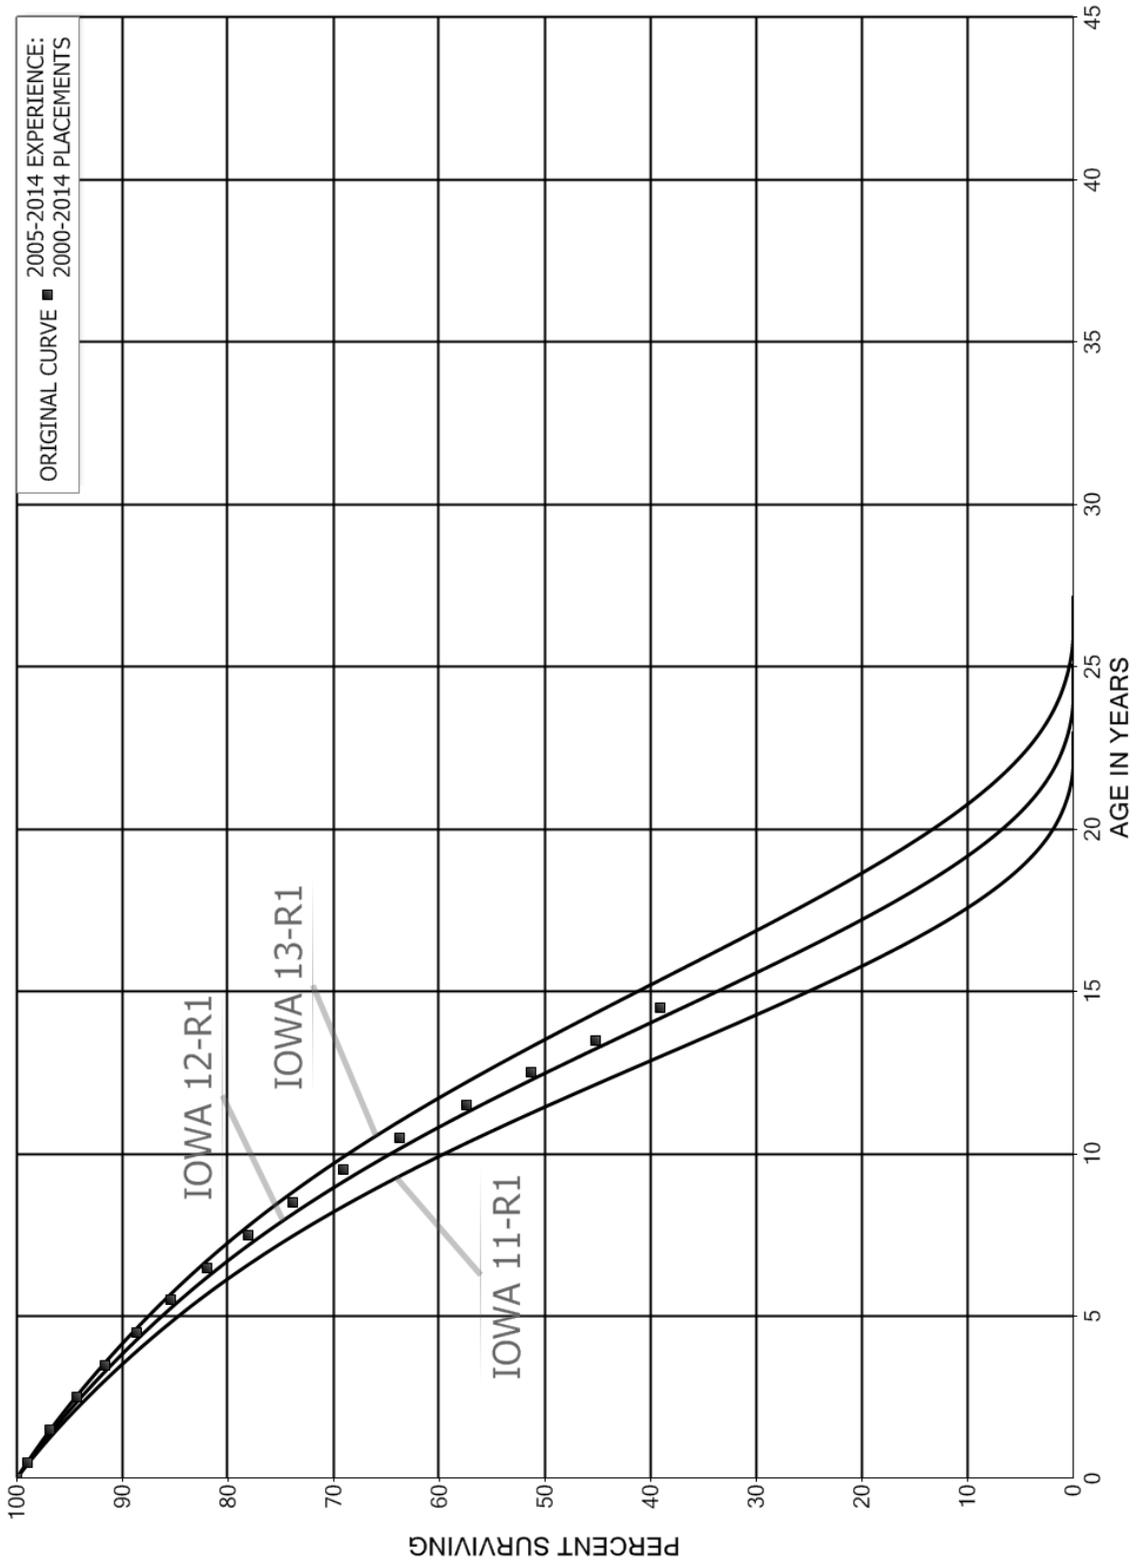

The lowa type curves are used in this study to smooth those original stub curves which are expressed as percents surviving at ages in years. Each original survivor curve was compared to the lowa curves using visual and mathematical matching in order to determine the better fitting smooth curves. In Figures 6, 7, and 8, the original curve developed in Schedule 4 is compared with the L, S, and R lowa type curves which most nearly fit the original survivor curve. In Figure 6, the L1 curve with an

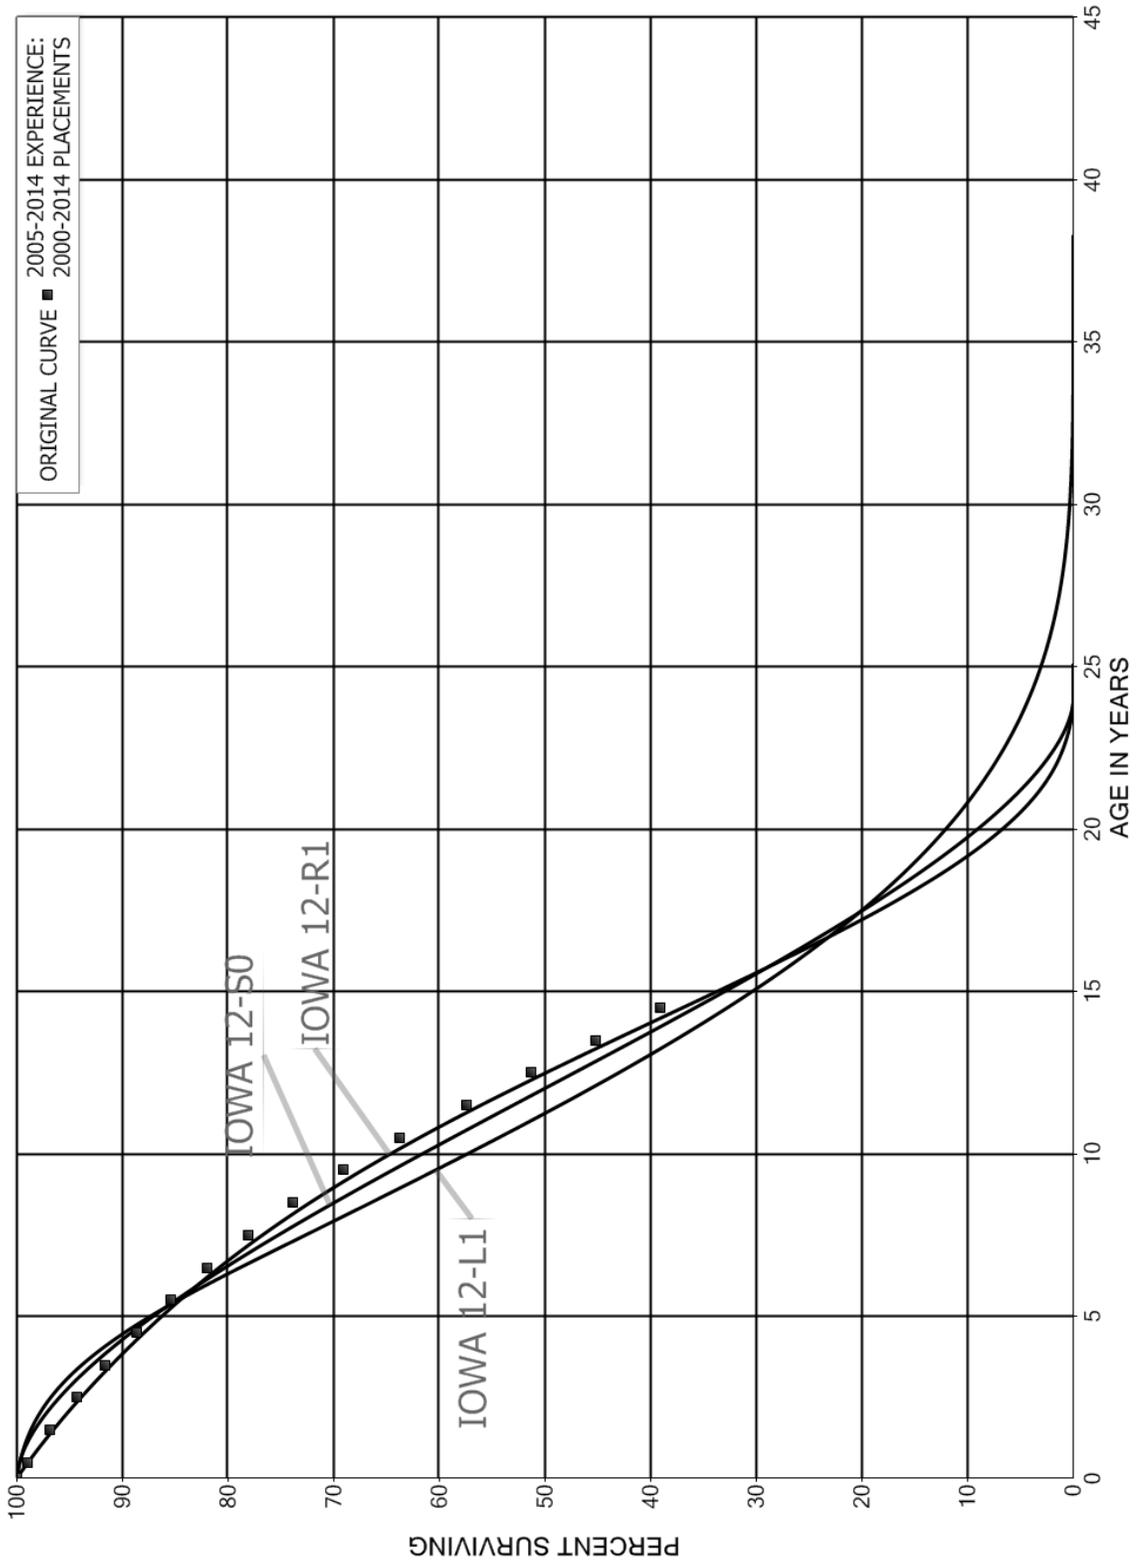

average life between 12 and 13 years appears to be the best fit. In Figure 7, the S0 type curve with a 12-year average life appears to be the best fit and appears to be better than the L1 fitting. In Figure 8, the R1 type curve with a 12-year average life appears to be the best fit and appears to be better than either the L1 or the S0.

In Figure 9, the three fittings, 12-L1, 12-S0 and 12-R1 are drawn for comparison purposes. It is probable that the 12-R1 lowa curve would be selected as the most representative of the plotted survivor characteristics of the group.

Attachment 2

Supply and Demand Analysis

1. Economic Life of Pipeline

To identify Alliance’s economic life of pipeline, Alliance has used information from the EIA’s 2015 Annual Energy Outlook (2015 AEO) which provides forecast data extending out to 2040. A review of implications from the EIA’s forecast suggests that Alliance may have difficulty maintaining throughput above the 50% utilization level beyond the mid-point of the 2030’s. The 2015 AEO forecasts Canadian export pipeline flows to the United States. Their forecast suggests that such flows will reach a low point in the mid-2030’s. The reason behind the decline of Canadian imports to the U.S. is primarily the significant growth of US production relative to demand growth, as shown in the chart below.

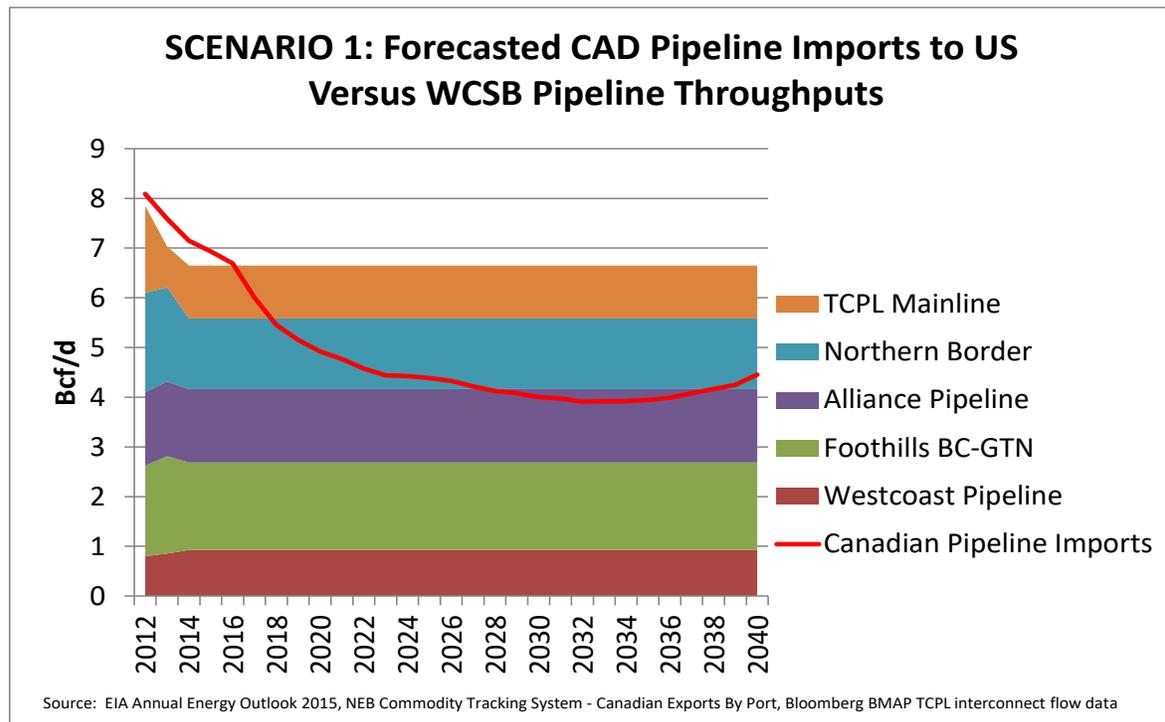

By making assumptions about the distribution of Canadian imports to the US across the five major WCSB export pipelines, a range of impacts to Alliance can be estimated. In all scenarios examined here, current export levels through Huntingdon and Kingsgate (Westcoast and GTN) are assumed to remain level as these westbound flows are, in Alliance’s view, among the least likely to experience displacement from growing US supplies of the WCSB export pipelines. The primary reason is that market demand, market access and supply competition appear relatively stable for Western Canadian Sedimentary Basin (WCSB)-sourced Pacific Northwest pipeline flows.

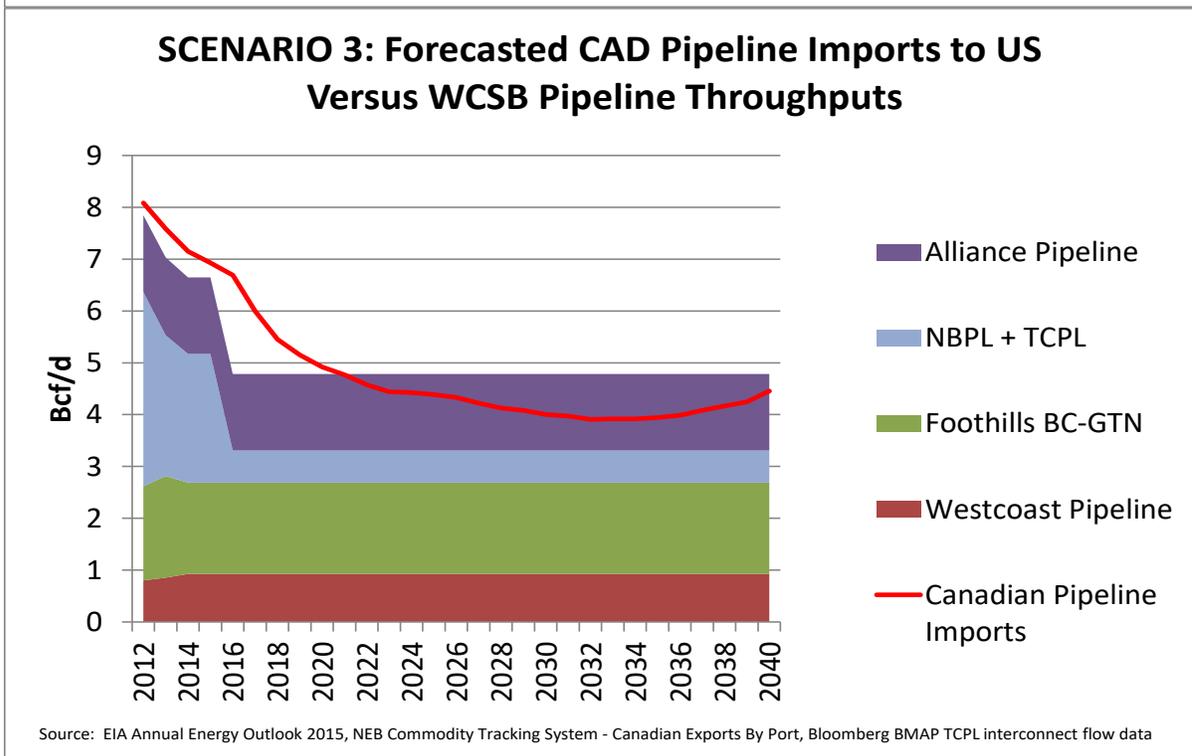

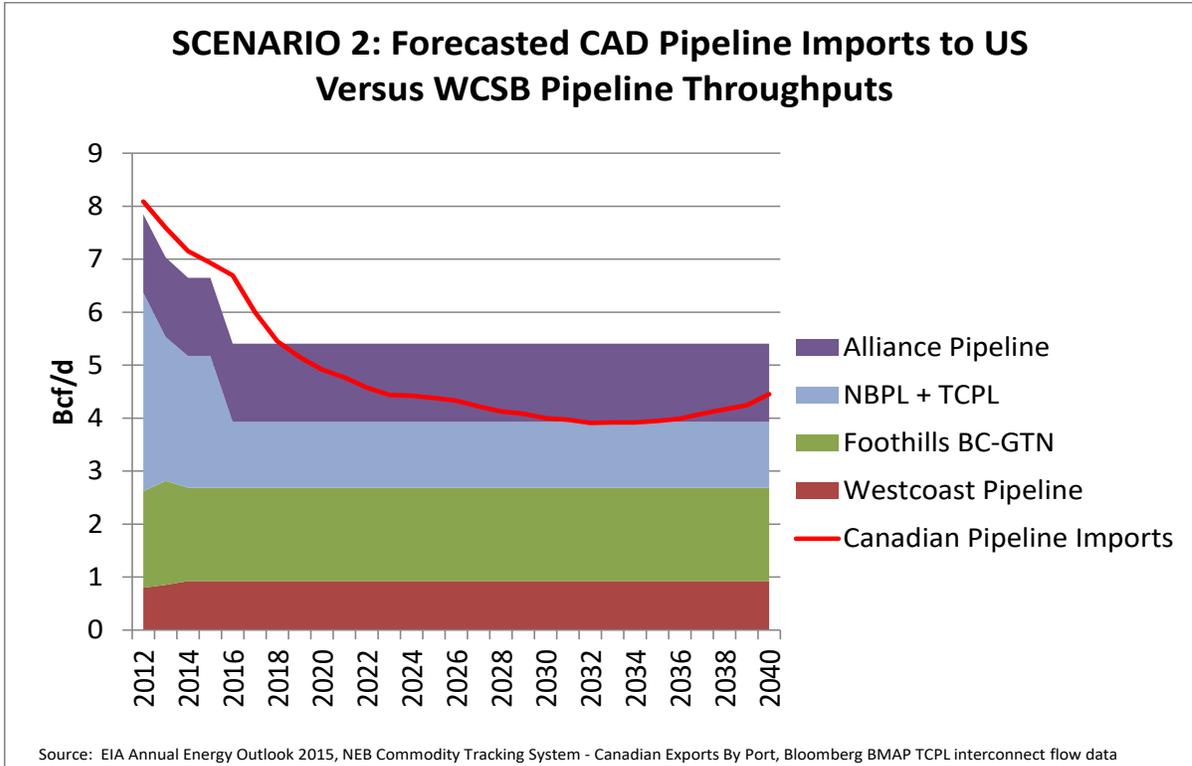

In contrast, Canadian deliveries to US markets in the US North-East, Mid-Atlantic and Midwest regions appear vulnerable to potentially significant displacement from growing production from the Marcellus and Utica shale plays generally concentrated in the Mid-Atlantic region. The Appalachian region is expected to grow by approximately 6 Bcf/d over the period from 2015 through 2040. Alliance, Northern Border and the TransCanada Mainline are therefore assumed to have greater risk of displacement as these pipelines deliver to the markets that are among those most impacted by the production growth of the Marcellus and Utica shales.

Scenario 1 shown below assumes that Northern Border and TransCanada experience the greatest risk of displacement and consequently deliver no Canadian volumes to the US by the mid-2030's. Under this assumption, Alliance flows are impacted minimally and there is no significant risk to the continued economic operation of the pipeline.

Scenario 2 assumes that Northern Border and TransCanada Mainline combined flows of WCSB volumes are reduced to 50% of 2014 levels. With this assumption, WCSB volumes available to move on Alliance Pipeline fall to virtually nothing by the mid-2030's.

The most likely impact to Alliance can potentially be determined by looking to the average of these two "book-end" scenarios. In this average scenario (labelled Scenario 3), Alliance would potentially lose over half of its throughput for a sustained period in the middle of the 2030's. As a result, the Gannett-Fleming determination that economic life would extend through 2034 but not further, appears a reasonable estimate.

To summarize these scenarios, Alliance likely faces significant economic challenges to continued existing operations if as little as 500 mmcf/d of Canadian volumes move on Northern Border or the TransCanada Mainline combined, given the total import levels

forecasted by the EIA. Alliance believes it is certainly feasible that the TransCanada Mainline and Northern Border would be able to accommodate significantly reduced flows from Canada without shutting in because these systems also are able to move significant volumes of gas from US production. For example, Northern Border has significant receipt capability from Bakken production in North Dakota and also other Rockies production from its interconnect with the 400 mmcf/d Bison Pipeline. Likewise, the TransCanada Mainline is expected to receive significant volumes of Marcellus and Utica production from its infrastructure in Southern Ontario and Quebec, which help to maintain revenue and throughput for the system. These factors support the credibility of a scenario where displacement of Canadian volumes is not an “all or nothing” scenario for these two pipeline systems. It is Alliance’s view that WCSB flows of at least 500 mmcf/d on Northern Border/TransCanada Mainline is a relatively conservative assumption and is supportive of a 20-year economic life for Alliance Pipeline under the EIA’s forecast assumptions.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Energy Probe Research Foundation (EP)

Interrogatory

Reference:

Exhibit 4, Tab 5, Schedule 1, page 5, *Table 2 Summary of Key Depreciation Parameters*

Question(s):

For each of the proposed parameters please provide the amount of increase or decrease in the 2024 depreciation expense compared to the combined EGD and Union depreciation expense using the current parameters.

Response:

The following response was prepared by Concentric Energy Advisors, Inc.:

Concentric has calculated the depreciation rates for all assets as at December 31, 2021 using the currently approved depreciation parameters and included them at Attachment 1. As it is not possible to separate the Union assets from the EGD assets, the depreciation parameters have been applied to the asset base as a whole. Consequently, the depreciation expense has been calculated twice – once with the EGD parameters and once with the Union parameters. In circumstances where EGD or Union did not have a comparable account in the previous study Concentric has selected the currently recommended parameters.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Energy Probe Research Foundation (EP)

Interrogatory

Reference:

Exhibit 4, Tab 5, Schedule 1, page 25, *Account 456 Underground Storage Compressor Equipment*

Preamble:

“The Tecumseh site consists of eleven slow-speed reciprocating integral compressors.”

Question(s):

In the EB-2022-0086 Decision the OEB approved the retirement of seven of the eleven compressors at Tecumseh. Did Concentric use this information in its study? If the answer is no, please explain why not and how this retirement would affect the results of the study. If the answer is yes, please explain how this affected the results of the study.

Response:

The following response was prepared by Concentric:

Concentric notes that the above referenced decision (EB-2022-0086) was issued in November 2022. The Enbridge Gas Depreciation Study was completed in October 2022, on data as at the end of 2021. As such, the approval of the application for replacement pipeline and retirement of the units was not available at the time study was completed. However, Concentric was made aware during the operating interviews that were conducted in August 2021, that an on-going review of the compression requirements related to the storage fields and transmission operations may result in the retirement of a number of compression units and that a new transmission pipeline may be required in 2023.

While not specifically noted in the depreciation study, the knowledge of the potential retirement was factored into the average service life estimates for Account 456.00 – Underground Storage – Compression Equipment. Specifically, the 40-R4 Iowa curve selected for Account 456.00 as shown in the Concentric report at page 6-30 identifies an expectation of significant retirement activity beginning at approximately 35 through age 55. As such the OEB approval of the project in Decision EB-2022-0086 does not have any impact on the average service life recommendation made by Concentric in Account 456.00.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Industrial Gas Users Association (IGUA)

Interrogatory

Reference:

Exhibit 4, Tab 5, Schedule 1, Attachment 1, page 4-3.

Preamble:

The following table summarizes the applied for amortization accounts included in the Concentric report.

Account	Title	Investment	Recommended Amortization Period in Years
474.00	Regulators	\$488,870,931	25
475.00	Mains Envision	\$181,264,676	25
483.00	Office Furniture and Equipment	\$29,776,062	15
486.00	Tools and Work Equipment	\$79,966,854	15
487.70	Rental - NGV Appl	\$864,755	15
487.80	Rental – NGV Stations	\$7,774,175	20
488.00	Communication Structures and Equipment	\$11,224,609	10
490.00	Computer Equipment	\$30,306,679	4
490.30	Computer Equipment – WAMS	\$4,680,899	10
491.01	Software Acquired Intangibles	\$155,164,785	4
491.02	Software Developed Intangibles	\$38,776,288	4
491.03	CIS Acquired Software	\$87,626,214	10
491.04	WAMS	\$85,221,905	10

Question(s):

- a) Please provide an explanation for each of the recommended amortization periods listed above, including a comparison to any available peer data.

- b) Please confirm that for assets such as computers and software, Concentric is recommending new asset classes post-2023 with new rates. If not confirmed, please explain.
- c) Further to the response to (b), please calculate the revised depreciation expense if the 2023 amortization rates for the asset classes were not adopted and instead the costs were amortized using the previously approved rates.
- d) Please provide empirical evidence from EGI that an amortization period of 4-years is a reasonable period of time for computer equipment and software.
- e) Regarding computer equipment and software, please provide a listing of all major assets included in the accounts, the expected useful life for the assets, and the basis upon which the expected useful life has been determined (i.e., contractual agreements, management best estimate, past experience, etc.).

Response:

- a) The following response has been provided by Concentric Energy Advisors, Inc.:

Please see response at Exhibit I.4.5-IGUA-26 and its accompanying Attachment 1 for the peer review used by Concentric in completing the depreciation study. The amortization periods in the chart listed are recommended in the study are based on the experience of Concentric, a review of Enbridge Gas policy regarding replacement of the assets within these accounts, and industry trends.

- b) The following response has been provided by Concentric Energy Advisors, Inc.:

Confirmed.

- c) The revised depreciation expense if the 2024 amortization rates for the computer hardware and software asset classes were not adopted and instead the costs were amortized using the previously approved rates is \$935.1 million. Note, this assumes that amortization accounting will still be implemented in 2024.

- c) The following response has been provided by Concentric Energy Advisors, Inc.:

Please see response at Exhibit I.4.5-STAFF-171 Attachment 5 for the operational and management staff interview notes. Further, page 15 of that attachment describes empirical evidence from Enbridge Gas that four years is an appropriate period for computer equipment and software.

d) Please see Table 1 for major software assets:

Table 1
Major Software Assets

Line No.	Asset	Expected useful life (years)	Gross Book Value (\$ million)
		(a)	(b)
1	CIS Replacement	8	9.9
2	Operations Digital system (2019)	8	8.4
3	Extranet Web 2.0 (2018)	2	5.9
4	Extranet Web 3.0 (2019)	2	5.1
5	GIS/GPS Upgrade	2	6.2
6	AWS Program	8	12.2
7	HANA Upgrade	7	14.1
8	WAMS Replacement	3	12.2
9	CIS Integration	8	40.2
10	EAM Software	2	13.6
11	PureConnect Program	2	5.0
12	Dawn Foxboro DCS Upgrade	4	6.6
13	GMAS Upgrade	6	27.0

The decision for the remaining useful life of these assets is based upon the expected use of the asset within the organization. Note the gross book value excludes overheads.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Industrial Gas Users Association (IGUA)

Interrogatory

Reference:

Exhibit 4, Tab 5, Schedule 1, pages 7 and 8, paragraph 18.

Preamble:

At paragraph 18, Enbridge Gas states:

“Concentric recommended the use of a credit adjusted risk-free (CARF) rate as an appropriate discount rate on the basis that the CARF is consistent with discount rates mandated by accounting standards for asset retirement obligations for financial statement disclosures and estimating the discount rate in securitization calculations. The CARF is also aligned with other pipelines in similar applications to the Canadian Energy Regulator (CER). Enbridge Gas’s CARF was 3.78% at the time the substantive work on the depreciation study was performed, which approximates the discount rate of 3.75% used by Concentric.”

Question(s):

- a) Please provide a summary of all jurisdictions studied by Concentric, and in particular by Mr. Kennedy, where the CDNS method for recovering net salvage costs is used or has been used. Please also provide a brief history of the use of CDNS in the jurisdiction including any relevant facts regarding its implementation or discontinuation as applicable.
- b) For each jurisdiction included in response to (a), please provide the current discount rate used to calculate net salvage under CDNS, if available, the historical discount rate used if CDNS is not currently used, and the discount rate recommended by Concentric. For each discount rate provided please also provide the stated rationale for the discount rate. For example, whether the rate was reflective of a credit adjusted risk-free or some other basis, as well as whether the rate is the approved or applied for rate.
- c) Please provide reference to the US GAAP standard, and a copy of the specific codified guidance, that requires the use of a credit adjusted risk-free rate as the discount rate in a CDNS calculation. Please provide the same information for asset retirement obligation calculations.

- d) Please confirm that the calculation of net salvage collected under CDNS is not equivalent to an asset retirement obligation calculation under US GAAP. If not confirmed, please fully explain and provide in an working Excel file illustrative calculations demonstrating how both calculations are equivalent.

Response:

The following response has been prepared by Concentric Energy Advisors, Inc.:

- a) The CDNS method of net salvage analysis is usually grouped with a more broad category of inflation adjusted net salvage calculations. The following list includes the jurisdictions that use an inflation adjusted calculation for which Concentric is aware:
- The Ontario Energy Board approved the use of the CDNS method for the legacy Enbridge Gas Assets in a 2012 net salvage review (proceeding EB-2012-0459);
 - The CDNS method was approved by the Alberta Utilities Commission (AUC) and its predecessors (Alberta Energy and Utilities Board) from the 1980's through 2004 for TransAlta Utilities Limited and AltaLink. In EUB Decision 2003-061, AltaLink was ordered to revert to the Traditional method of net salvage analysis.
 - The National Energy Board of Canada (now the Canada Energy Regulator) mandated the use of an inflation adjusted net salvage calculation for all NEB regulated group 1 pipelines in NEB Decisions RH-2-2008 (the LMCI Decision). The LMCI net salvage calculations are very similar to the CDNS calculations used in this current proceeding.
 - Mr. Kennedy is aware that the United States Nuclear Regulatory Commission (NRC) regulations require licensees of nuclear power plants to submit data every two years, and annually in some cases, on the status of funds to be put aside to cover the cost of decommissioning their nuclear plants (known as the Decommissioning Funding Status (DFS) Report). The NRC staff independently analyzes each of these reports to determine whether the agency has reasonable assurance the licensees are providing sufficient funding for radiological decommissioning of the reactor when it is permanently shut down. This assurance is referred to as "decommissioning funding assurance (DFA)".
- b) For each of the jurisdictions identified above, Mr. Kennedy is aware of the general practice as outlined in response to part a) of this question but is not aware of the specific deals of each application or the precise discount rates used in an application. However, the following outlines Mr. Kennedy's understanding of the discount rate used, in specific cases where Mr. Kennedy entered evidence on this topic:

- In OEB Decision EB-2012-0459 the OEB mandated that the CDNS calculations be updated in a compliance filing to use a discount rate generally at the mid-point of the proposed 2.38% and 4.3%, however the order was based on the resultant amount of refund of the SRC surplus and a precise rate was identified.
 - Mr. Kennedy is not aware of the discount rate used in the applications filed by TransAlta Utilities Inc. prior to the year 2000 and noted above the EUB mandated the discounted use of the CDNS method in 2003.
 - While Mr. Kennedy is aware that the group 1 pipelines were mandated to use credit adjusted risk-free rates, Mr. Kennedy is not aware of the precise rates used in the NEB (and CER) applications.
 - Mr. Kennedy has not participated in any of the applications before the NRC and is not aware of the discount rates used in the DRS calculations.
- c) USGAAP does not specifically provide guidance related to CDNS calculations. However, USGAAP does provide guidance suggesting the use of a credit adjusted risk-free rate in the calculation of Asset Retirement Obligations. In accordance with the copyright restrictions of Original Pronouncements of the Financial Accounting Standards Board, a copy of the standard cannot be copied and provided. However, Section 8 of FASB 143 states:

8. An expected present value technique will usually be the only appropriate technique with which to estimate the fair value of a liability for an asset retirement obligation. An entity, when using that technique, shall discount the expected cash flows using a credit-adjusted risk-free rate. Thus, the effect of an entity's credit standing is reflected in the discount rate rather than in the expected cash flows. [Emphasis added]

While a copy of the Standard cannot be provided, the fasb.org Website does permit links to the be used. As such, the link to the public website is:

https://fasb.org/Page/ShowPdf?path=aop_FAS143.pdf&title=FAS+143+%28AS+AM+ENDED%29&acceptedDisclaimer=true&Submit=

As noted in the above quote, the discount rate to be used in an ARO calculated is to be the credit adjusted risk-free rate.

- d) Confirmed. However, Concentric notes that the mechanics of the obligation are very similar to the CDNS calculations used in this current application. Concentric also notes that the use of an ARO in compliance with USGAAP is contingent upon requirements resulting from legal obligations, whereas the use of recovery of future net salvage costs in depreciation rates do not require a legal obligation for the removal of assets.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Industrial Gas Users Association (IGUA)

Interrogatory

Reference:

Exhibit 4, Tab 5, Schedule 1, pages 9 to 15.

Preamble:

Enbridge Gas reports several reclassifications of assets between USA accounts. The IGUA requests further details on the impact of the reclassifications on depreciation and net salvage.

Question(s):

Please prepare a working Excel schedule that separately reports the impact of each transfer on the forecast depreciation and net salvage costs for each account. Please prepare the calculations using both the applied for rates in one Excel file and the previously approved rates in the second file.

Response:

The following response has been provided by Concentric:

Concentric is unable to provide a working Excel schedule that separately reports the impact of each transfer as the data at the account level was provided on a combined basis.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Industrial Gas Users Association (IGUA)

Interrogatory

Reference:

Exhibit 4, Tab 5, Schedule 1, Attachment 1, page 3-3.

Preamble:

Concentric provides an example in a table comparing the ELG and ALG procedure, and concludes: *First, using the ALG procedure, after the first 5 years, no depreciation has been collected for the asset remaining in service. Essentially, the concept of depreciation expense matching the assets providing service is not met.*

Question(s):

- a) Please confirm that the example may not properly reflect the results of a mass property account where a significant portion of a vintage of assets are retired at or after the average service life, and over a relatively short period of time. For example, if 95% of the vintage of assets are retired at approximately year 50, does Concentric agree that the difference under ELG and ALG would be less significant. If not confirmed, please explain.
- b) Notwithstanding the simplified example provided by Concentric, does Concentric agree that while \$1,000 of accumulated depreciation is removed under the ALG example in year 5, from an accounting perspective both assets were charged \$100 of depreciation per year (i.e, \$500 in total up to year 5), as opposed to just one asset being charged \$1,000 of depreciation expense? For example, the asset that was retired would have in theory been charged \$500 of depreciation expense (\$100 per year) and would have negative accumulated depreciation of \$500 with the retirement of \$1,000 in year 5, whereas the second asset would also have \$500 of depreciation accumulated. If not confirmed, please reconcile the above with the required accounting entries to record mass property depreciation under US GAAP and best practices for regulated utilities.
- c) Please confirm that the determination of depreciation under either ELG or ALG is an estimate. If not confirmed, please explain.

- d) Please confirm that Concentric expects that future updates to the estimated lives of at least some of the asset classes will be required whether an ELG or ALG procedure is applied. If not confirmed, please explain.
- e) Please confirm that adoption of the ELG procedure will increase the depreciation expense for EGI, all else being equal. If not confirmed, please explain.
- f) Concentric has advised that EGI continues to consider the adoption of modified depreciation expense in the future to reflect an economic depreciation expense based on an economic planning horizon. Adoption of an economic planning horizon approach will truncate the lives of the assets and further increase depreciation expense as Concentric's calculations demonstrate. EGI is applying to increase depreciation expense by \$193.9 million in 2024. Please quantify the portion of this increase that is related to the change from the ALG and generation arrangement procedures to ELG. Please also provide the detailed calculations in Excel showing the derivation of the change on an account-by-account basis.

Response:

The following response has been provided by Concentric:

- a) Concentric agrees that the example provided in the depreciation report is a simplified example, used to explain the concept of Average Life Group versus Equal Life Group. For the impact of ALG on the Enbridge Gas depreciation study, please see response to Exhibit I.4.5-STAFF-173 part e).
- b) Confirmed.
- c) All depreciation parameters are an estimate, however the depreciation expense and rate that result from the estimates are based on mathematical formulas. As such, the depreciation expense and rates themselves are mathematically derived figures based on an underlying estimate.
- d) Confirmed.
- e) All straight line depreciation procedures accrue the same amount of depreciation expense over the life of the account. However, the immediate impact of a change to ELG for Enbridge Gas is an increase in the depreciation expense. This increase will lessen in later years, and eventually it is expected that the ELG procedure will result in lower accruals than ALG.
- f) Concentric provided the depreciation expense using the ALG procedure in response at Exhibit I.4.5-STAFF-173 part e). It is expected that the change from the

Generation Arrangement results in minimal depreciation impact as the Generation Arrangement and ELG use very similar calculations. Due to the extraordinary amount of effort to perform the Generation Arrangement calculations for every account, Concentric has not included these calculations as part of this response.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Industrial Gas Users Association (IGUA)

Interrogatory

Reference:

Exhibit 4, Tab 5, Schedule 1, Attachment 1, page 3-10.

Preamble:

Concentric discusses four alternatives to address the collection of salvage costs

Question(s):

- a) Please prepare a schedule (in a working Excel file) that provides the last ten years of negative net salvage collected by EGD and Union, as well as the last 10 years of actual salvage costs incurred (i.e., 2013 to 2022).
- b) Please also provide a schedule showing the build up of the accumulated net salvage balance using the opening balance at the beginning of the 10-year period for each entity.
- c) Please provide a forecast of the net salvage to be collected and the salvage costs forecast to be incurred for the next 10 years (i.e., 2023 to 2032).

Response:

- a-b) Please see Attachment 1. Enbridge Gas is not able to quantify the actual amounts collected. The attachment is populated based on the site restoration cost provision included within accumulated depreciation, net of costs incurred over time. Please see response at Exhibit I.1.8-Staff-17 for further details.
- c) Please see the 2023 to 2026 forecast in response at Exhibit I.1.8-STAFF-17, part f). Enbridge Gas is only able to provide forecast data for 2023 to 2026 as the data is not available for the 2027 to 2032 period.

Table 1 - Historical Net Salvage by Utility in \$ Million

Year	EGD					Union				EGI			
	Opening Balance	Cost of Removal	Adjustments	Clearance Adjustment	Closing Balance	Opening Balance	Cost of Removal	Adjustments	Closing Balance	Opening Balance	Cost of Removal	Adjustments	Closing Balance

ENBRIDGE GAS INC.

Answer to Interrogatory from
Industrial Gas Users Association (IGUA)

Interrogatory

Reference:

Exhibit 4, Tab 5, Schedule 1, Attachment 1, page 3-12.

Preamble:

Concentric states that for the CDNS calculation it first calculates the historic indications of salvage costs, then escalates these costs at a rate of 2% to the future date the costs are incurred and finally discounts the costs back at an assumed credit adjusted risk-free rate of 3.75%.

Question(s):

- a) Please provide a working Excel model that calculates the CDNS recommended salvage rate for each account. Please ensure that all support related to the determination of the 2% inflation and the credit adjusted risk-free rate are included in the model and that a change to one of the parameters provides for an update of both the CDNS salvage rate and the forecast costs by account.
- b) For each account, please summarize all adjustments made by Concentric to the historic indications of salvage costs that were in addition to applying an escalation rate to the historical costs. Additionally, please explain what escalation rates were applied to the costs, and why those rates are reasonable.
- c) Further to the response to (b), if available, please provide the derivation of the historic indications of salvage costs for each account in a working Excel file showing both the escalation of costs and any adjustments made to reflect current indications of costs.

Response:

The following response was provided by Concentric Energy Advisors, Inc.:

- a) Please see Attachment 1 for a working model of the CDNS calculations. Please note that the support for the inflation rate and credit adjusted risk-free rate are not

included in this model as both inflation rate and the credit adjusted risk-free rate are inputs into the system.

Please see response at Exhibit I.4.5-STAFF-168 for a discussion of the use of the 2% inflation and the 3.75% discount rates.

- b) There was no escalation of historic retirement costs made in the calculation of the CDNS amounts. All amounts used in the historical salvage analysis are included in Section 7 of the depreciation study. There were no changes made to the historic data used in this study.
- c) Please see part b).

Account 452.00
 Cost of Removal Estimate 0.15
 Average Age of Retirements 22.91 23
 Credit Adjusted Risk Free Rate 3.75

ENBRIDGE GAS INC.

Answer to Interrogatory from
Industrial Gas Users Association (IGUA)

Interrogatory

Reference:

Exhibit 4, Tab 5, Schedule 1, Attachment 1, Section 6.

Question(s):

- a) For all accounts included in Section 6, please provide revised lowa curves that reflect the actual retirement experience, the recommended curve, the historically approved curves for each of EGD and Union Gas, if different, and all other lowa curves studied by Concentric, including the residual measure of each of those curves.
- b) Please provide an illustrative calculation in a working Excel file for Account 466 demonstrating how Concentric has calculated its residual measures as between the reported retirements and the retirement curve for each of the curves studied. Please also outline any judgment applied by Concentric to its calculations or formulas used in the analysis and determination of residual measures.
- c) For each account, please provide the information included in each "Retirement Rate Analysis", for example at page 6-72, in an Excel file, including the age at the beginning of the interval, exposures at beginning of age interval, retirement during age interval, retirement ratio, survivor ratio, and % surviving. Please include a separate tab for each account.

Response:

The following response has been provided by Concentric:

- a) Please see Exhibit I.4.5 STAFF-171 Attachment 4 for all curves considered by Concentric in the completion of the depreciation study and their related residual measures.
- b) Concentric calculates its residual measure as described in the Depreciation Study, at Exhibit 4, Tab 5, Schedule 1, Attachment 1, pages 3 to 8, as below:

“The program that is used by Concentric for statistical smooth curve fitting utilizes an internal “goodness-of-fit” criterion known as the Residual Measure. This Residual Measure is based on a least squares solution of the differences between the stub curve (or original data points) and smooth survivor curve which also requires a balancing of the differences above and below the stub curve.

The criterion of goodness-of-fit is the mean square of the differences between the points on the stub and fitted smooth survivor curves. The residual measure, or standard error of estimate, shown in the output format is the square root of this mean square. As such, the lower the Residual Measure the better the statistical fit between the analyzed lowa curve and the observed data points. Concentric follows the widely used practice of fitting lowa curves up to one percent of the maximum exposures. This standard practice is utilized to minimize the influence of typically small retirements applied to similarly small exposures which may unduly affect the lowa curve fitting process. However, Concentric will recognize the observed data points beyond the one percent of maximum exposures if it is determined that the additional data is a valid consideration for life recommendation.”

- c) The “Retirement Rate Analysis” calculations provided in Section 6 of the Concentric Report are directly output in a PDF format from the proprietorial and copyrighted software package used by Concentric. As such, these pages are not able to be provided in an Excel format.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Industrial Gas Users Association (IGUA)

Interrogatory

Reference:

Exhibit 4, Tab 5, Schedule 1, Attachment 1, page 3-15.

Preamble:

Concentric states for Account 466 that Canadian gas distribution utility peers have a range of lives between 35 and 37 years. Concentric recommends a 30-R4 curve (as compared to 30-S3 previously approved) for Account 466 which has a residual measure of 3.3601.

Question(s):

- a) Please provide revised IOWA curves and residual measures for Account 466 using the following curves:
 - i. IOWA 35-R4.
 - ii. IOWA 37-R4.
 - iii. IOWA 40-R4.
- b) Please calculate, using the ELG and ALG procedures, the impact on depreciation and net salvage of the above changes in IOWA curve and provide all supporting calculations.
- c) From a review of observed retirement data on page 6-58, it appears that the compressor equipment has a significantly longer average service life than Concentric estimates. For example, approximately 80% of the investment is surviving beyond age 45. Please explain in detail the underlying characteristics of this account that are leading to the resulting retirement pattern and why, based on this information, the recommended survivor curve is reasonable as compared to a longer life curve. For example, please explain in detail what assets are included, why the observed life characteristics are occurring and why the results should be considered reasonable.
- d) Please comment on whether the compressor equipment undergoes routine maintenance over time to extend the useful life of the assets or whether the compressor equipment generally is replaced after a fixed period of time with or

without replacement. Please reconcile this discussion with the observed retirement pattern on page 6-58.

Please provide a detailed explanation of the characteristics of the assets in this account, the approach to maintenance, expected operational lives, and other considerations that are relevant to the useful life of the physical assets. Please also describe the normal life cycle of the assets, including any maintenance or refurbishment.

Response:

a) The following response has been provided by Concentric Energy Advisors, Inc.:

- i. The calculated Residual Measure for Account 466 using an Iowa 35-R4 is 2.5281.
- ii. The calculated Residual Measure for Account 466 using an Iowa 37-R4 is 2.1554.
- iii. The calculated Residual Measure for Account 466 using an Iowa 40-R4 is 1.6014.

Please see Attachment 1 for the revised Iowa Curves using the life parameters above.

b) The following response has been provided by Concentric Energy Advisors, Inc.:

Please see Attachment 2 for the calculations of the impact on depreciation using the above changes in Iowa curves. Please see Attachment 3 for the supporting calculations for each curve and life parameter.

c) The following response has been provided by Concentric Energy Advisors, Inc.:

The graph shown on page 6-58 is related to the actuarial analysis located on pages 6-59 through 6-60. When reviewing the actuarial analysis, it is noted that the exposures decrease rapidly from 1 billion dollars at age 0 to \$356 million at age 6.5 without any retirement activity. Further, by age 14.5 the exposures drop to 126 million with only 1.4 million dollars in retirements. That indicates that Enbridge Gas has invested a large amount of money in very recent years. As such, it is expected that the historical data indications may not be representative of the future retirement patterns. Therefore, it is appropriate to place less weighting on the actuarial analysis for this account.

d) Please see Exhibit 2, Tab 6, Schedule 2, page 180, Table 5.3.4-1 under Maintenance Strategies which outlines the maintenance approach taken to extend

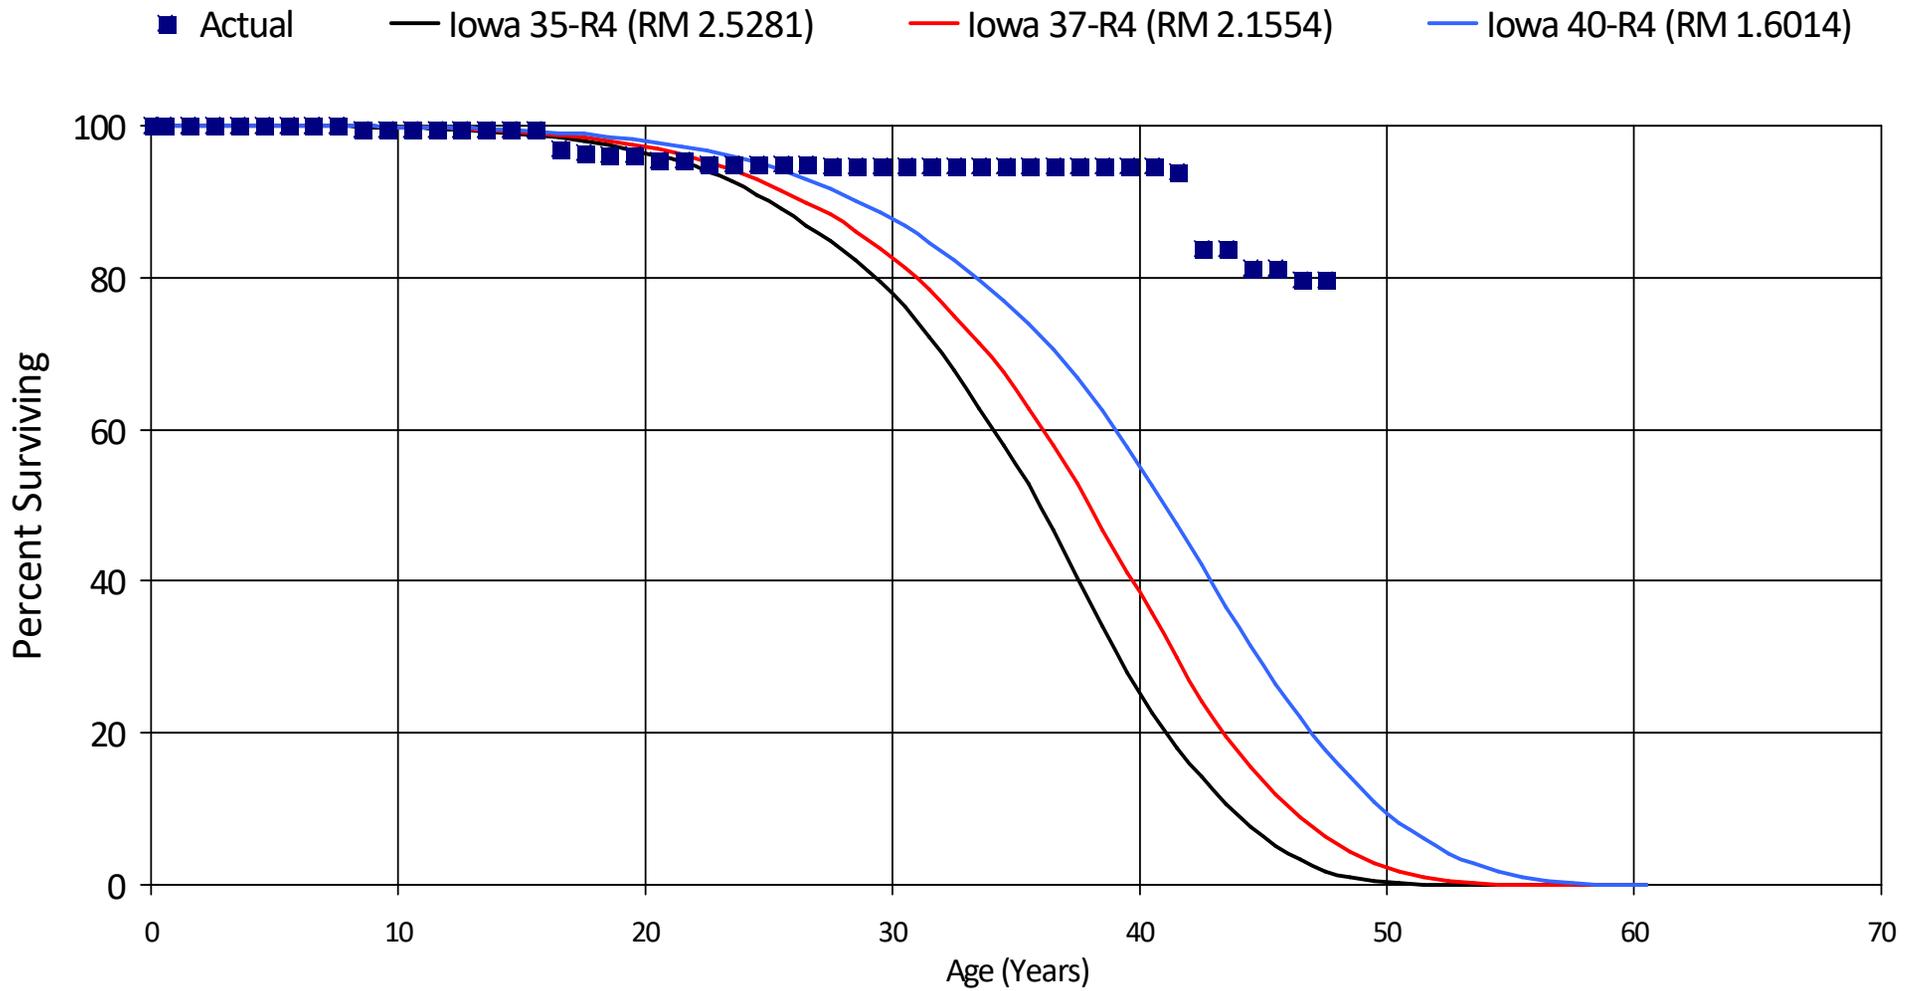

the useful life of compression station assets, and Section 5.3.5.1 on pages 182 to 184 which outlines the condition assessment methodology employed. Additionally, please see Section 5.3.5.4.1 on pages 187 to 190 which discusses the compressor modernization strategy that supports decision-making around asset renewal. Characteristics of the asset class are described in Section 5.3.5 on pages 181 to 288. While some smaller components within compressor stations are replaced within a fixed period of time through time-based replacement strategies outlined in Section 5.3.5.4.7 on page 191, replacement of major compression equipment is largely driven by discontinuation of Original Equipment Manufacturer (OEM) support and equipment reliability concerns as described in Section 5.3.5.4.1. While each OEM may support their product lines for different lengths of time, prior discussions with the OEM's for several of Enbridge Gas's most critical compressor equipment have suggested availability for equipment support will become limited after 40 years (See. EB-2020-0191, Exhibit C, Tab 2, Schedule 1, page 194, Section 5.5.5.2). However, Enbridge Gas continues to explore opportunities to extend equipment life through modernization of components at overhauls as provided at Exhibit 2, Tab 6, Schedule 2, Section 5.3.5.4.1.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Industrial Gas Users Association (IGUA)

Interrogatory

Reference:

Exhibit 4, Tab 5, Schedule 1, Attachment 2.

Preamble:

Concentric is proposing an increase in depreciation related to account 472.35 of \$8.9 million, with a proposed rate of 50.48% compared to the current rate of 2.32%. Concentric also reports that there is a truncation date (page 5-2) of 2023 for the Mainway assets.

Question(s):

- a) Please provide a further explanation for the truncation of these assets in 2023. Please advise when it became known to EGI that the life of the assets would be truncated in 2023. Further, please provide any evidence from the previous depreciation study that supports the previously used lives.
- b) If available, please provide the historical retirement data for this account.
- c) The surviving original cost for these assets in December 31, 2021 (Page 5-2) was \$15.9 million. The calculated accrual appears to result in a true up of depreciation in 2024. Please provide a schedule showing the actual depreciation charged to account 472.35 historically, as well as the forecast depreciation to be claimed.
- d) For account 482.04 the truncation date was 2022 and that there was no further depreciation forecast in 2024. Given this approach, please fully explain why a truncation of 2023, would result in forecast depreciation in 2024 for account 472.35, whereas a truncation of 2022 does not.
- e) Please provide the actual retirement date for the assets, and explain whether the assets have been retired. If the assets have not been retired, please explain when the assets will be retired.

Response:

- a) The Mainway assets in account 472.35 are expected to be retired once the new Greater Toronto Area (GTA) West site is constructed. At the time of the study, the forecasted retirement date was 2023 however this was subsequently updated for budget purposes to 2024. The GTA West Project will consolidate the Mainway, Burlington and Milton assets into one central location and as described at Exhibit 1, Tab 9, Schedule 1, page 23. The previous depreciation study completed by Fosters Associates did not have a truncation date for the Mainway assets. All structures and improvements for Union in the South rate zone used a common life assumption of 35 years. Please see EB-2011-0210, Exhibit D2, page 28.
- b) Please see Attachment 1. Note that Enbridge Gas is not able to identify the retirements specifically for Mainway since the related retirement transactions are grouped within the overall structures and improvement account.
- c) Please see Table 1.

Table 1
472.35 Accrued Depreciation

Account	Actual Depreciation 2021 LTD	Forecasted Depreciation 2022	Forecasted Depreciation 2023	Forecasted Depreciation 2024
472.35 Structures and Improvements – Mainway	\$3,958,252	\$369,745	\$369,745	\$9,075,267

- d) For account 482.04, it was assumed in our forecast that the building would be disposed of in 2022 and therefore no depreciation would be calculated on this asset in 2024. Account 472.35 had a calculated depreciation value in 2024 as the expected disposal date was updated to 2024 during the budget cycle.
- e) The forecasted disposal year for the Mainway assets is 2024.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Industrial Gas Users Association (IGUA)

Interrogatory

Reference:

Exhibit 4, Tab 5, Schedule 1, Attachment 1, page 3-17 and 3-18.

Preamble:

Concentric is proposing an increase in depreciation related to account 473.01 of \$48.1 million, with a proposed rate of 3.63% compared to the current rate of 2.27% for EGD and 3.02% for Union. No peer analysis appears to have been considered and the selected curve results in a worse residual measure than other alternatives.

Question(s):

- a) Please provide revised lowa curves and residual measures for Account 473.01 using the following curves:
 - i. lowa 45-L1.0.
 - ii. lowa 45-L0.5.
 - iii. lowa 50-L1.0.
 - iv. lowa 50-L0.5.
- b) Please calculate, using the EGL and ALG procedures, the impact on depreciation and net salvage of the above changes in lowa curve and provide all supporting calculations.
- c) From a review of retirement data on page 6-71, it appears that the assets in this account have an unusual life with rapid retirements through age 40.5 and then a stabilization of retirements thereafter with another increase in retirements after approximately age 60.5. Please explain in detail the underlying characteristics of this account that are leading to the resulting retirement pattern and why, based on this information, the recommended survivor curve is reasonable as compared to a longer life curve. For example, please explain in detail what assets are included, why the observed life characteristics are occurring and why the results are considered reasonable.
- d) Please provide a detailed explanation of the characteristics of the assets in this account, the approach to maintenance, expected operational lives, and other considerations that are relevant to the useful life of the physical assets. Please also

describe the normal life cycle of the assets, including any maintenance or refurbishment.

- e) Please comment on whether the assets in this account undergo routine maintenance over time to extend the useful life of the assets or whether the assets are generally replaced after a fixed period of time with or without replacement. Please reconcile this discussion with the observed staged retirement pattern on page 6-71.
- f) Given the long apparent life of the assets in this account, has Concentric attempted to model an O curve (i.e., an O4 curve) against the observed retirement data. If not, why not?
- g) Please provide the curve fit for this account that results in the best residual measure for the observed retirement data both through age 50.5 and through the entirety of the observed data. If the result is achieved by two different curves, please provide both. Please also provide the lowa curve and the calculated depreciation expense (including net salvage), using each curve.

Response:

- a) The following response has been provided by Concentric Energy Advisors, Inc.:
 - i. The calculated Residual Measure for Account 473.01 using an Iowa 45-L1 is 0.9574.
 - ii. The calculated Residual Measure for Account 473.01 using an Iowa 45-L0.5 is 0.8171.
 - iii. The calculated Residual Measure for Account 473.01 using an Iowa 50-L1 is 1.1223.
 - iv. The calculated Residual Measure for Account 473.01 using an Iowa 50-L0.5 is 0.9796.

Please see Attachment 1 for the revised Iowa Curves using the life parameters above.

- b) The following response has been provided by Concentric Energy Advisors, Inc.

Please see Attachment 2 for the impact on depreciation and net salvage with the above changes to the Iowa curves. Please see Attachment 3 for the supporting calculations.

- c) The following response has been provided by Concentric Energy Advisors, Inc.:

The retirement data graphed on page 6-71 relates to the actuarial analysis shown on pages 6-72 through 6-76. Concentric follows the widely-used practice of fitting lowa curves up to 1% of the maximum exposures. This standard practice is utilized to minimize the influence of typically small retirements applied to similarly small exposures which may unduly affect the lowa curve fitting process. Concentric does however recognize the observed data points beyond the 1% of maximum exposures, if it is determined that the additional data is a valid consideration for life recommendation. Account 473.01 reaches the one percent point at age 65.5. As such, minimal weighting is placed on data points beyond age 65.5.

Concentric does not solely rely on historical results in its recommendations. Concentric begins analyses on historical retirement patterns and then discusses the historical indications through operational and management interviews with knowledgeable Enbridge Gas personnel. These operational and management interviews also discuss any future expectations that Company personnel may view as life parameter influencing factors. Concentric also performs a peer comparison analyses, which is combined with knowledge of other utility company practices and recommendations, to evaluate life and net salvage parameters. Concentric then performs a visual analysis of the recommendations to the observed data. Lastly, through the knowledge and experience in each jurisdiction and regulator, Concentric must make considerations in the parameter selections. With the above analyses and considerations, Concentric will qualitatively base the life parameter recommendations to ensure the best possible life and net salvage predictions. In the circumstances of Account 473.01, the currently approved lives of 50-R1.5 and 45-L1.5 were considered, along with results from the peer analysis, included in response at Exhibit I.4.5-IGUA-26 Attachment 1. Concentric placed highest weighting on the retirements through age 52.5 as these were the years of the highest retirement activity and largest exposures. Of the total retirement experience of 413 million dollars, 400 million dollars occurred before age 53.5, representing 98 percent of the total retirement activity. These retirements indicate that a life shortening may be appropriate. However, the historical data from age 53.5 through age 65.5, combined with the peer analysis, discussions with Enbridge Gas operations and management staff, and the professional judgement of Concentric indicated that a life shortening was not reasonable at this time. As such, Concentric recommends a slight change to the mode of the lowa curve from an L1.5 to an S1 and to maintain the currently approved average service life of 45 years.

- d) Characteristics and expected operational life for steel services are similar to those described for steel mains under Exhibit 2, Tab 6, Schedule 2, pages 85 to 94 Sections 5.2.3.4, 5.2.3.4.1, 5.2.3.4.1.2.1, page 96, and pages 96 to 98, Section

5.2.3.4.2. Approach to maintenance includes corrosion control, cathodic protection surveys, and leak management as described on page 82, Table 5.2.3-2.

- e) The assets are not replaced after a fixed period of time. Their condition is monitored through maintenance activities provided in part d). Upon discovery of leaks or damage, or at the request of third parties wishing to construct new infrastructure which conflicts with the asset location, assets are typically replaced under the service replacement program described in Exhibit 2, Tab 6, Schedule 2, Section 5.2.3.6.2.4.
- f) The following response has been provided by Concentric Energy Advisors, Inc.:

The O family of Iowa curves are not a good fit to the historical data for this account as the maximum life indications are unreasonably long. The O4 curve, as suggested in this question, results in a maximum life of 440 percent of the average life. For this account, with an average life of 45 years, that would result in some metal services remaining in service for 198 years, far beyond the expected maximum life of these assets. In comparison, the maximum life as indicated by the S1 curve, as recommended by Concentric is 200 percent of the average life, or 90 years. This is a more reasonable estimate for the assets in this account. Additionally, the remaining life increases in the O4 curve through 110 percent of life. This is contrary to the nature of most utility assets, including metal services.

Further, the O4 curve will result in an increase in the depreciation expense in the newest vintages due to the assumption that the highest retirement ratio occurs in year one. As this account has had over 100 million dollars installed in 2021, this results in a large increase in overall depreciation expense for this account.

Concentric always considers all curve shapes when selecting life parameters. However, Concentric rarely views an O4 or any O curve to be realistic of the expected retirement patterns for natural gas or electric assets as an O curve assumes the highest retirement ration occurs in the first years of the accounts life. As such, an O shape curve was not modelled when selecting a life parameter for this account.

- g) The following response has been provided by Concentric Energy Advisors, Inc.:

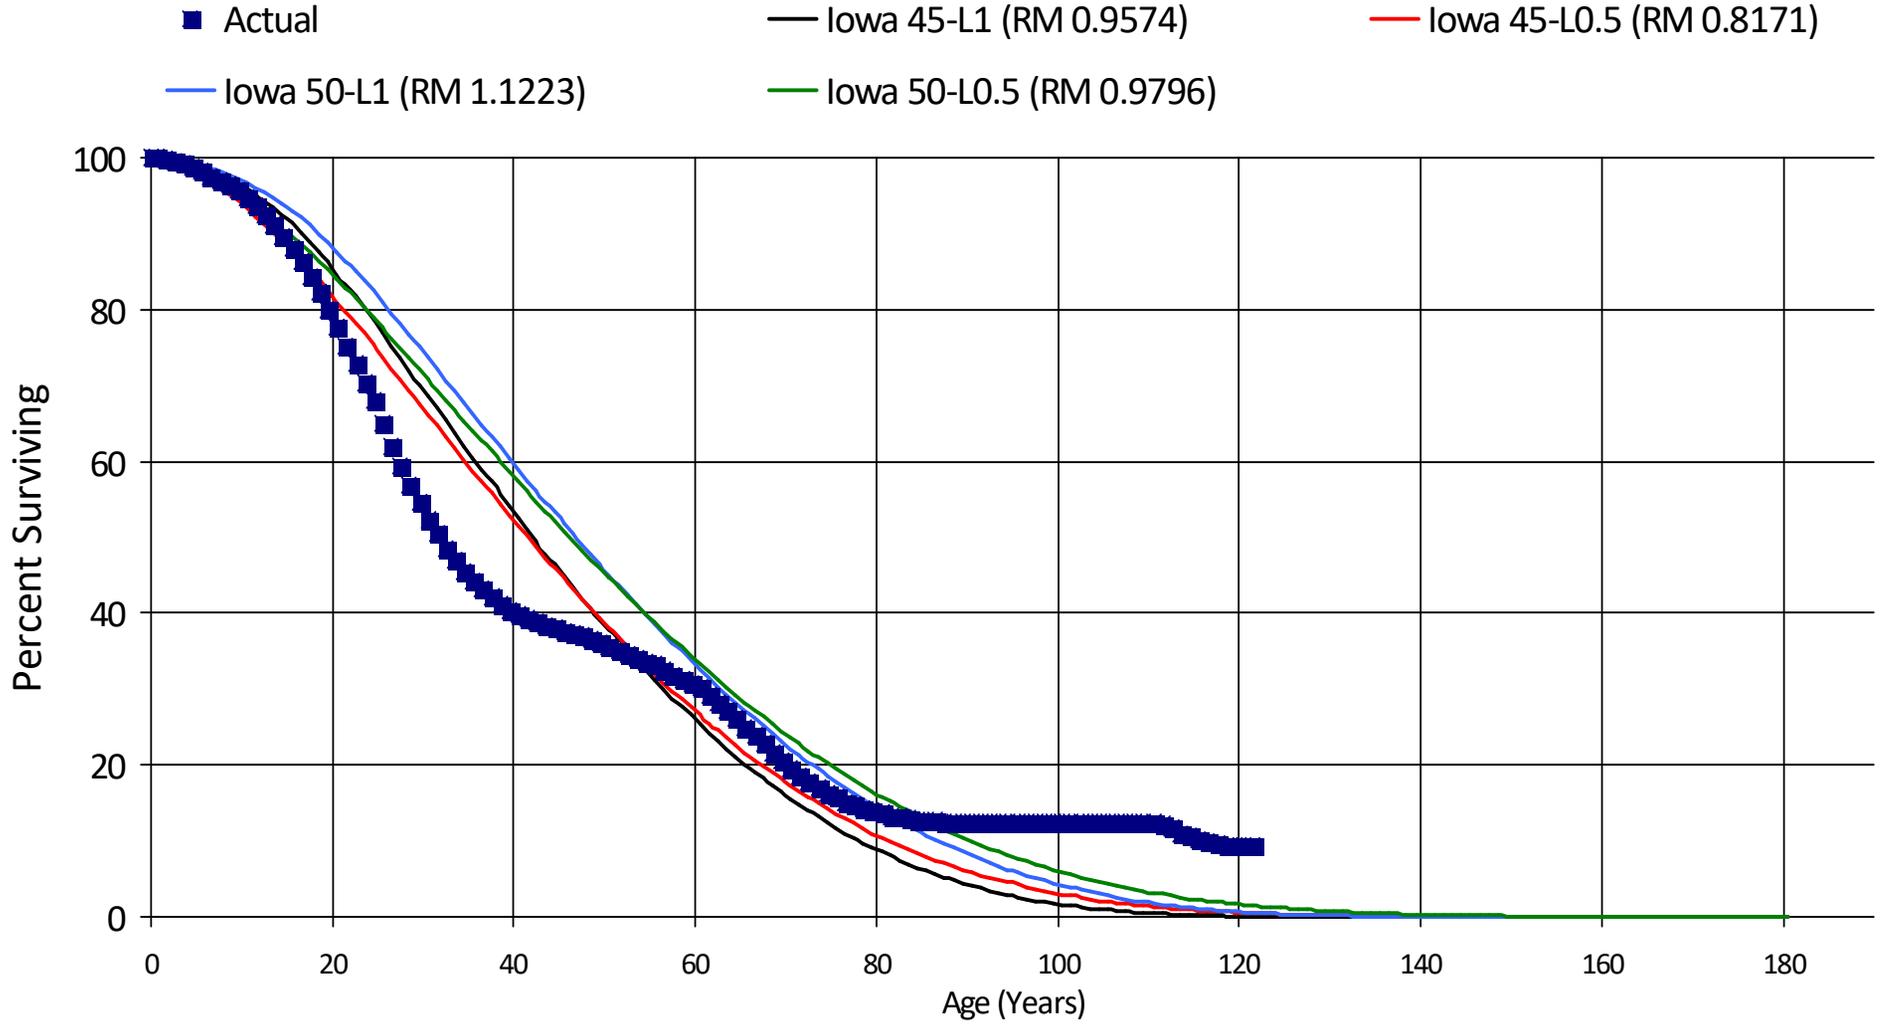

The curve that provides the best residual measure for the data through age 50.5 is an Iowa 38-L0.5 with a RM of 0.2688. The curve that provides the best residual measure through the entirety of the observed data is an Iowa 44-L0.5 with a RM of 0.8098. Please see Attachment 4 for the Iowa Curves. The calculated Depreciation Expense including Net Salvage using an Iowa 38-L0.5 is \$24,441,262. The calculated Depreciation Expense including Net Salvage using an Iowa 44-L0.5 is \$19,836,140.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Industrial Gas Users Association (IGUA)

Interrogatory

Reference:

Exhibit 4, Tab 5, Schedule 1, Attachment 1, page 3-18 and 3-19.

Preamble:

For Account 474 - regulators - Concentric is proposing an increase in the depreciation rate to 8.86% (from 5.00%) despite no collection of net salvage and a proposed extension of the life from 20-SQ to 25-SQ.

Question(s):

- a) Please provide a detailed calculation of the 8.86% depreciation rate and reconcile this rate with the previously approved rate of 5.00% for Union under the generation arrangement procedure.
- b) Concentric states the “investment in this account is more heavily weighted towards the historic Union assets” but it is noted in Attachment 2 that \$315.9 million of the historical investment was in EGD and only \$192.5 million is in Union. Please reconcile this information with Concentric’s statement.
- c) No Iowa curve was provided for the assets in Account 474. Please fully explain why this is the case and if retirement data exists, please provide the previously approved and applied for Iowa curves mapped against that data.
- d) Please provide a detailed explanation of the characteristics of the assets in this account, the approach to maintenance, expected operational lives, and other considerations that are relevant to the useful life of the physical assets. Please describe the normal life cycle of the assets, including any maintenance or refurbishment.

Response:

The following response has been provided by Concentric.

- a) Concentric has recreated the depreciation calculations for Account 474 in Excel format at Attachment 1 in order to respond to this request.
- Columns A and B (Year and Original Cost) are from the Enbridge Gas accounting records;
 - Column C (Calculated Accumulated Depreciation) is based on the widely accepted ELG calculations and can not be created in Excel;
 - Column D (Allocated Actual Booked Amount) allocates the booked accumulated depreciation amount on the basis of the calculated accumulated depreciation;
 - Column E (Accumulated Depreciation Factor) is provided for informational purposes and is not used in the depreciation calculations;
 - Column F (Net Book Value) is calculated as Column B (Original Cost) less Column D (Allocated Actual Booked Amount);
 - Column G (ELG Remaining Life) is based on the widely accepted ELG calculations as published in Iowa State Bulletin 155 and are calculated within Concentric's proprietary software. The calculations cannot be re-created in Excel without a significant amount of modelling;
 - Column H (Annual Accrual) is Column F (Net Book Value) divided by Column G (ELG Remaining Life) with a minimum remaining life of 1 year;
 - Columns I, J, and K (Average Age, Composite Average Age Calculation, and Direct Weighted ELG Composite R/L Calculation) are provided for informational purposes and are not used in the depreciation calculations.

The whole life depreciation rate for Account 474 is 4% based on the selection of the Iowa 25-SQ. This account has an accumulated depreciation amount of \$59,858,893, compared to the calculated (theoretical) accumulated depreciation amount of \$184,821,830. This means that Enbridge Gas is under-accrued by \$124,962,937. This is recovered over the remaining life of each vintage in order to ensure that each vintage has been fully accrued at the time of retirement. As such, the true up of the accumulated depreciation variance results in a depreciation rate that is higher than the whole life rate.

The currently approved depreciation rate for this account is based on the whole life rate of 5 percent. This does not allow for the true up of the accumulated depreciation variance. As such, Concentric recommends the theoretically correct depreciation rate of 8.86 percent be used for this account.

b) The following response has been provided by Concentric.

Concentric notes that the table included in Exhibit 4, Tab 5, Schedule 1, Attachment 2 is as at 2024, while the depreciation study is as at 2021.

c) The following response has been provided by Concentric.

There is no lowa curve provided for this account as it is an amortized account as seen in the table on page 4-3 of the Depreciation Study. For the amortized account there is no lowa curve provided as the retirement patterns are based primarily on company policy and how the assets live in the specific utility.

d) Please see Exhibit 2, Tab 6, Schedule 2, page 123 under pressure control, page 126 Table 5.2.4-3 under Pressure Control, and pages 154-168 for a description of the function and characteristics, expected operational lives and other considerations relevant to the useful lives of the assets in this account, and page 125, Table 5.2.4-2 and page 150, Table 5.2.5-3 for maintenance strategies.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Industrial Gas Users Association (IGUA)

Interrogatory

Reference:

Exhibit 4, Tab 5, Schedule 1, Attachment 1, page 3-19.

Preamble:

Concentric states for Account 475.21 that Canadian peers have a range of lives between 55 and 80 years. Concentric recommends a 55-R3 curve (as compared to 61-R3 previously approved for EGD or other curves) for Account 475.21. The calculated residual measure for the 55-R3 curve is inferior to other residual measures.

Question(s):

- a) Please provide revised lowa curves and residual measures for Account 475.21 using the following curves:
 - i. lowa 60-R3.
 - ii. lowa 61-R3.
 - iii. lowa 70-R3.
 - iv. lowa 80-R3
- b) Please calculate, using the ELG and ALG procedures, the impact on depreciation and net salvage of the above changes in lowa curve and provide all supporting calculations.
- c) Has Concentric modeled whether an R2 or R2.5 curve may have a better visual fit to the observed retirement data through age 40.5? If not, why not. Please provide a revised lowa curve and residual measure using a 60-R2 and 60-R2.5 curve. Further, please provide the same information for a 65 and 70 year life.
- d) From a review of retirement data on page 6-83, it appears that there is a relatively consistent retirement of assets at each age, as depicted by the actual retirement pattern. However, a significant portion of the assets continues to survive well beyond the average life. Please explain in detail the underlying characteristics of this account that are leading to the resulting retirement pattern and why, based on this information, the recommended survivor curve is reasonable as compared to a longer life curve. For example, please explain in detail what assets are included, why the

observed life characteristics are occurring and why the results are considered reasonable.

- e) Please provide a detailed explanation of the characteristics of the assets in this account, the approach to maintenance, expected operational lives, and other considerations that are relevant to the useful life of the physical assets. Please also describe the normal life cycle of the assets, including any maintenance or refurbishment.

Response:

The following response has been provided by Concentric:

- a)
- i. The calculated Residual Measure for Account 475.21 using an Iowa 60-R3 is 3.3526.
 - ii. The calculated Residual Measure for Account 475.21 using an Iowa 61-R3 is 3.2601.
 - iii. The calculated Residual Measure for Account 475.21 using an Iowa 70-R3 is 2.4246.
 - iv. The calculated Residual Measure for Account 475.21 using an Iowa 80-R3 is 1.5254.

Please see Attachment 1 for the revised Iowa Curves using the life parameters above.

- b) Please see Attachment 2 for the impact on depreciation and net salvage with the above changes to the Iowa curves. Please see Attachment 3 for the supporting calculations.
- c) Concentric included R2 and R2.5 shaped curves in the actuarial analysis, however, Concentric did not perform a T-cut analysis at age 40.5 when analyzing any curve selection. All curves considered included the data points beyond age 40.5 as those points were deemed to be relevant to the historical retirement experience.

The calculated Residual Measure for Account 475.21 using an Iowa 60-R2 is 0.0988.

The calculated Residual Measure for Account 475.21 using an Iowa 60-R2.5 is 0.0705.

The calculated Residual Measure for Account 475.21 using an Iowa 70-R2 is 0.0669.

The calculated Residual Measure for Account 475.21 using an Iowa 70-R2.5 is 0.1727.

The calculated Residual Measure for Account 475.21 using an Iowa 80-R2 is 0.1505.

The calculated Residual Measure for Account 475.21 using an Iowa 80-R2.5 is 0.2470.

Please see Attachment 4 for the Iowa curves through age 40.5 that produce the Residual Measures listed above.

- d) Please see the response at Exhibit I.4.5-STAFF-178 part h) for the response to this question.

The following response has been provided by Enbridge Gas:

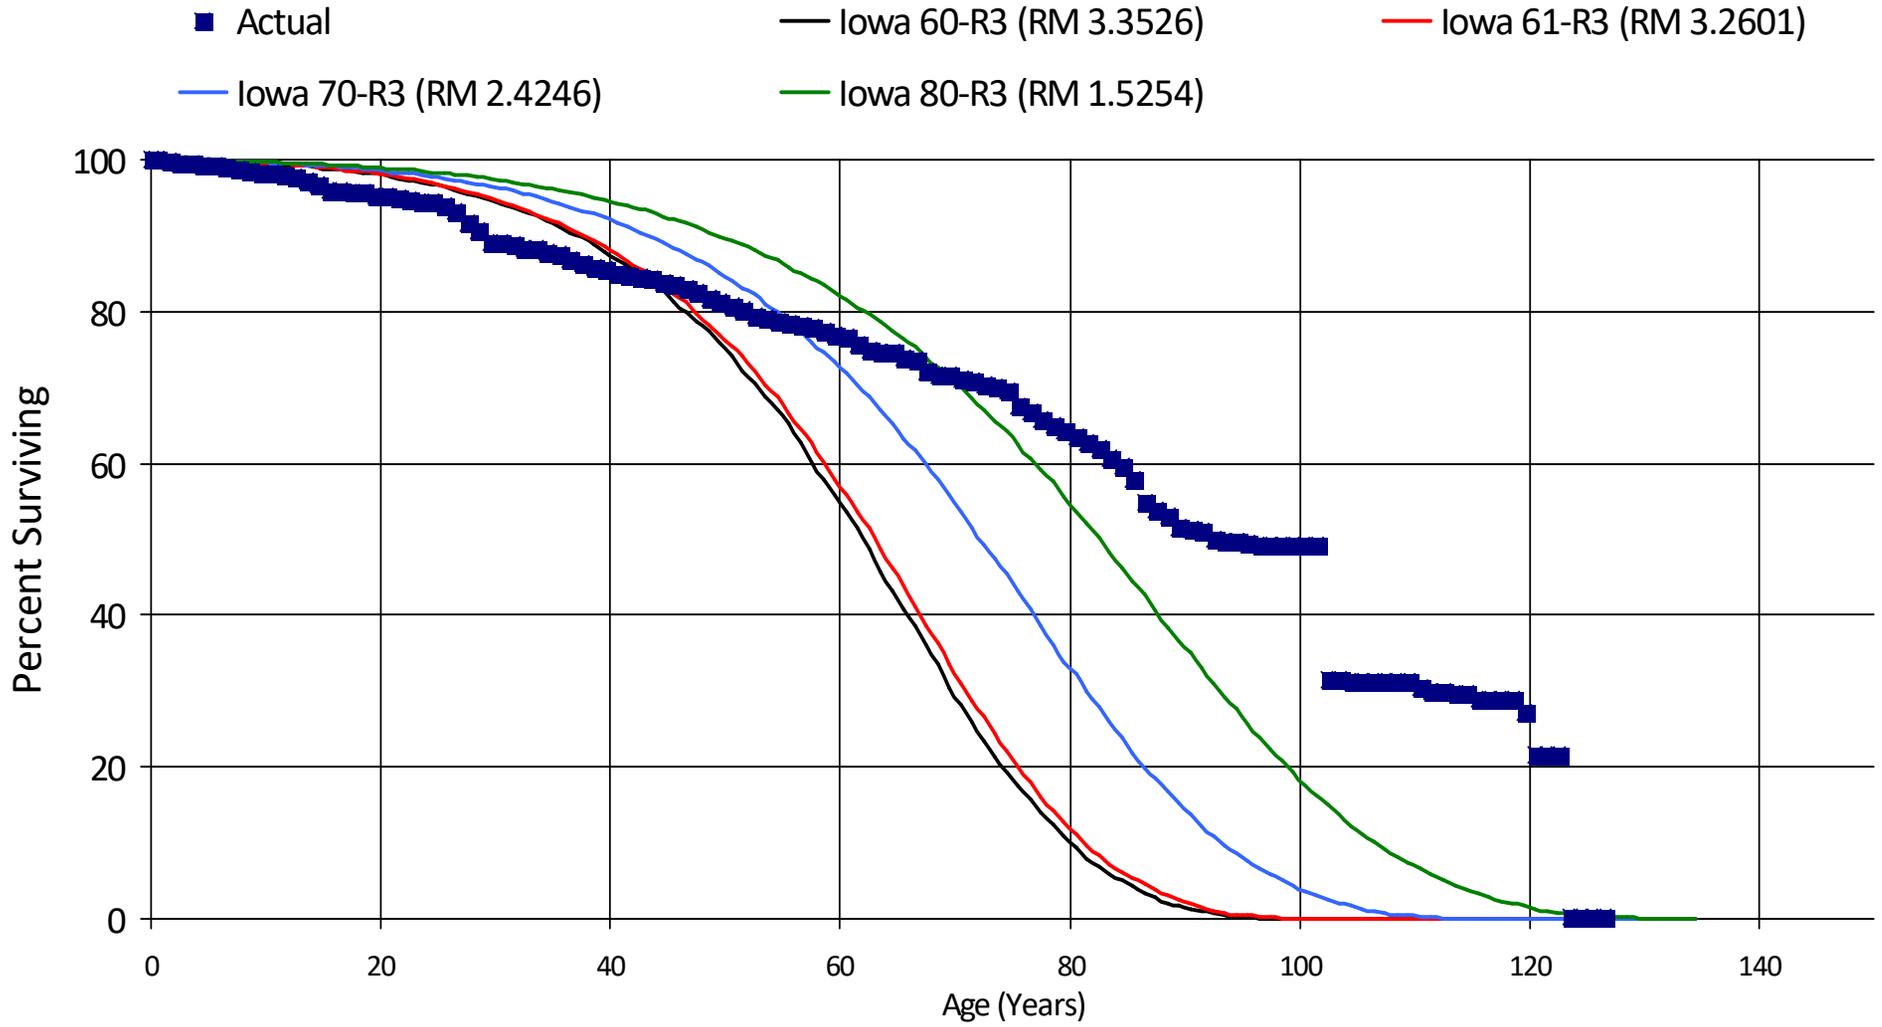

- e) Please see Exhibit 2, Tab 6, Schedule 2, pages 119-120, Table 5.2.3-4 and page 85, Section 5.2.3.4

ENBRIDGE GAS INC.

Answer to Interrogatory from
Industrial Gas Users Association (IGUA)

Interrogatory

Reference:

Exhibit 4, Tab 5, Schedule 1, Attachment 1, page 3-20.

Preamble:

Concentric is proposing an increase in the depreciation rate related to account 475.3 to 2.72% from 1.85% (EGD) and 2.35% (Union). The increase occurs despite holding net salvage largely unchanged, and results in a \$27.0 million increase in the depreciation provision per Attachment 2. The proposed 60-R4 Iowa curve is also on the low end of the peer range of 60-80 years for this asset class, and has a higher residual measure than other curves.

Question(s):

- a) Please provide revised Iowa curves and residual measures for Account 475.3 using the following curves:
 - i. Iowa 65-R3.5.
 - ii. Iowa 65-R3.0.
 - iii. Iowa 65-R4.0.
 - iv. Iowa 70-R2.0
- b) Please calculate, using the ELG and ALG procedures, the impact on depreciation and net salvage of the above changes in Iowa curve and provide all supporting calculations.
- c) Please provide a detailed explanation of the characteristics of the assets in this account, the approach to maintenance, expected operational lives, and other considerations that are relevant to the useful life of the physical assets. Please also describe the normal life cycle of the assets, including any maintenance or refurbishment.

Response:

The following response was provided by Concentric.

- a)
- i. The calculated Residual Measure for Account 475.30 using an Iowa 65-R3.5 is 0.3989.
 - ii. The calculated Residual Measure for Account 475.30 using an Iowa 65-R3 is 0.3571.
 - iii. The calculated Residual Measure for Account 475.30 using an Iowa 65-R4 is 0.4813.
 - iv. The calculated Residual Measure for Account 475.30 using an Iowa 70-R2 is 0.3116.

Please see Attachment 1 for the revised Iowa curves using the life parameters above.

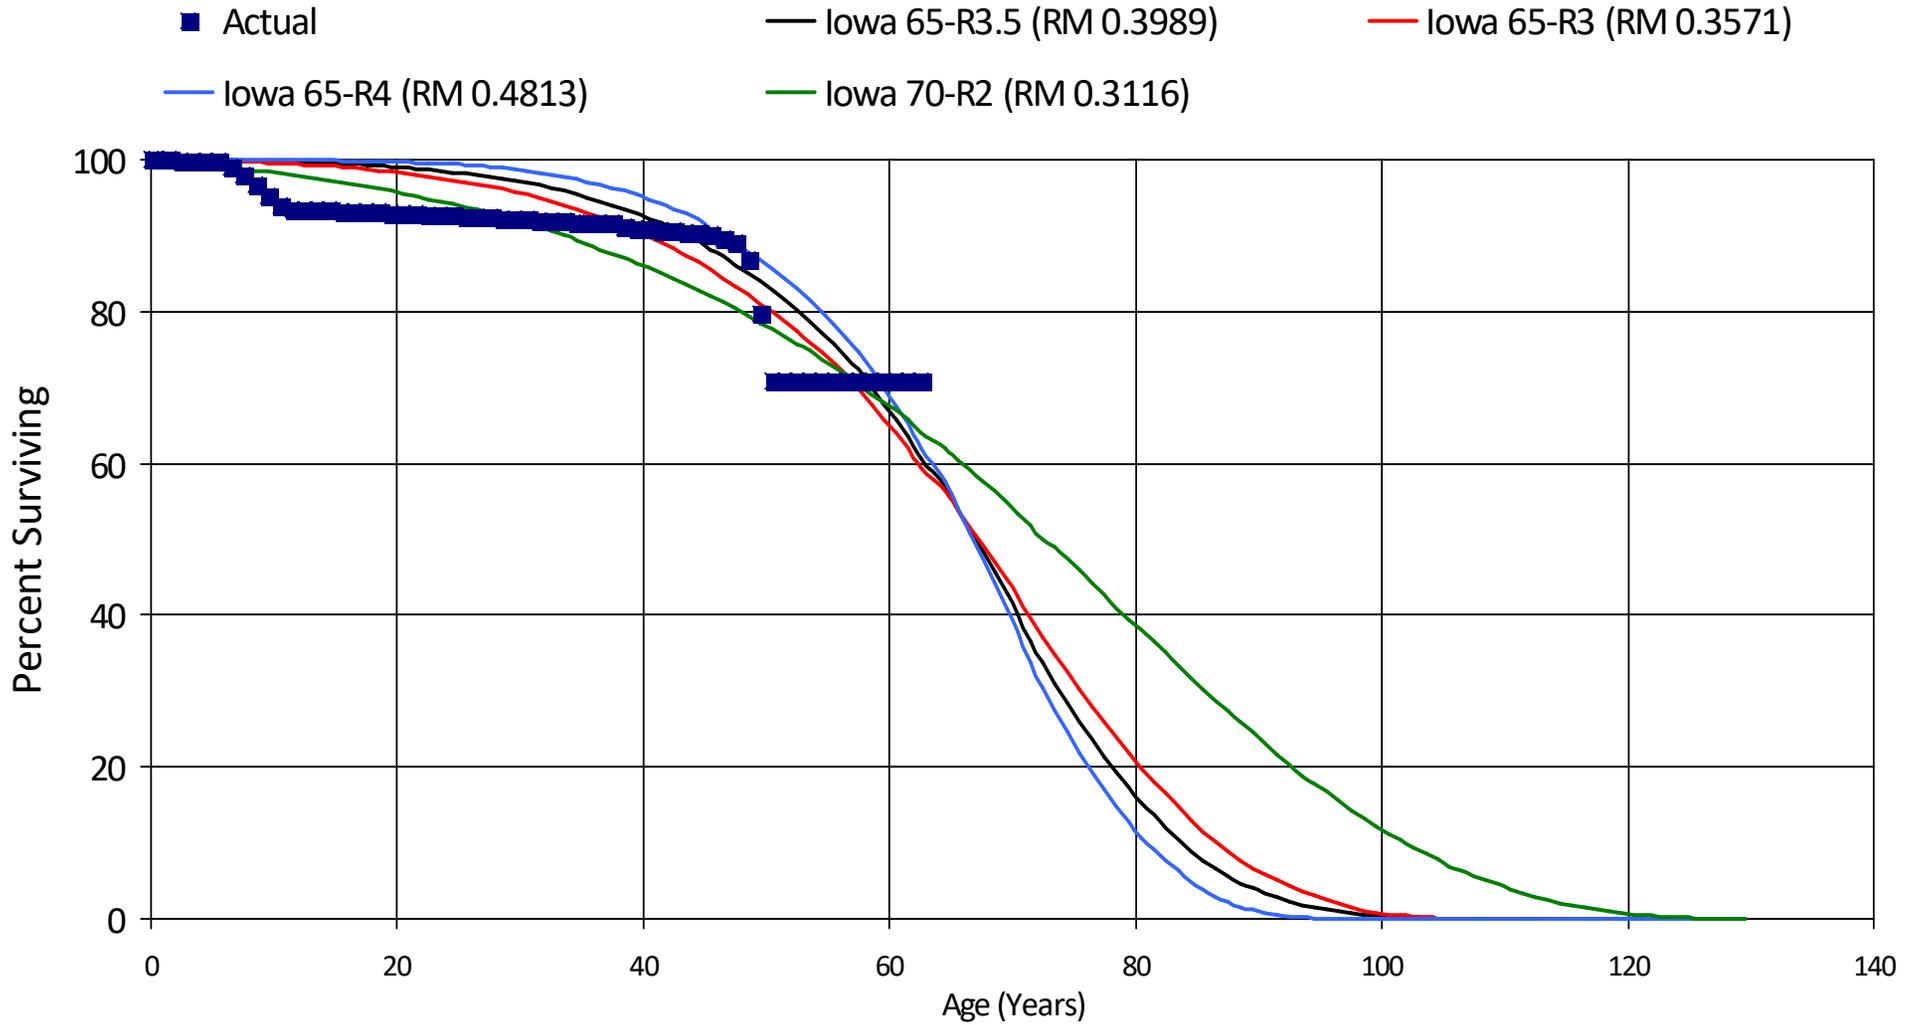

- b) Please see Attachment 2 for the impact on depreciation and net salvage with the above changes to the Iowa curves. Please see Attachment 3 for the supporting calculations.
- c) Please see Exhibit 2, Tab 6, Schedule 2, pages 98-107 for characteristics of assets, expected operational lives and considerations relevant to the useful life of physical assets in this account; and page 82, Table 5.2.3-2 for maintenance strategies.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Industrial Gas Users Association (IGUA)

Interrogatory

Reference:

Exhibit 4, Tab 5, Schedule 1, Attachment 1, pages 3-21.

Preamble:

For Account 478, Concentric recommends a 15-S2.5 curve, which does not appear to fit the retirement data well either visually or mathematically as per page 6-100. Further, Concentric's evidence refers to a potential advanced metering infrastructure program as apparent support for the recommended life.

Question(s):

- a) Please confirm that the average life of the meters based on the retirement data occurs at approximately age 27.5 to 28.5. If not confirmed, please explain.
- b) Has Concentric considered using an amortization account for these assets as opposed to the 15-S2.5 curve? Please fully explain why an amortization account would not be appropriate.
- c) Please calculate the impact on depreciation and net salvage costs of using a 30 year amortization account for Account 478 as opposed to the 15-S2.5 curve recommended by Concentric.
- d) Please provide a detailed explanation of the characteristics of the assets in this account, the approach to maintenance, expected operational lives, and other considerations that are relevant to the useful life of the physical assets. Please also describe the normal life cycle of the assets, including any maintenance or refurbishment.
- e) Please further expand on the relevance of an advanced metering initiative for this account, and why that initiative would impact the lives of the assets in this account.

Response:

- a) The following response was provided by Concentric Energy Advisors, Inc.:

Not confirmed. The historical retirements cross the 50 percent surviving between ages 27.5 and 28.5, however this should not be understood as the average age of the assets in this account. As the percent surviving is calculated based on varying levels of exposures, each vintage is not equally weighted when calculating the average age at retirement. A more accurate calculation of average age at retirement is obtained by multiplying the dollars retired by the age at retirement, divided by the total dollars of retirement. This calculation produces an average age at retirement of 19.6 years. Please see Attachment 1. Concentric recommends a life shorter than this to recognize the technical changes in meters installed today as compared to those installed historically, the influence of updated Measurement Canada testing requirements, and the potential upcoming AMI replacement program.

b) The following response was provided by Concentric Energy Advisors, Inc.:

Concentric considers all Iowa curves when recommending lives for each account. However, in this case, the characteristics of Account 478 do not align with amortization accounting where all assets will get retired at the end of the amortization period. There will be interim retirements, and some assets within the account that will live longer than the average life.

c) The following response was provided by Concentric Energy Advisors, Inc.:

Please see Attachment 2 for the impact on depreciation and net salvage when using 30-year amortization for this account.

d) Please see Exhibit 2, Tab 6, Schedule 2, pages 144 to 145 "Natural Gas Meters" for characteristics of assets, expected operational lives and considerations relevant to the useful life of physical assets in this account; and page 150, Table 5.2.5-3 for maintenance strategies.

e) General information on the Advanced Metering Infrastructure (AMI) pilot can be found at Exhibit 2, Tab 6, Schedule 2, page 170, Section 5.2.5.9.3 Advanced Meter Infrastructure Pilot. Further information on the benefits and future plans for advanced metering assets can be found at Exhibit 2, Tab 7, Schedule 2, Advanced Metering Infrastructure.

The following response was provided by Concentric Energy Advisors, Inc.:

AMI meters are subject to a differing set of forces of retirement as compared to analogue meters, and as such, it is the experience of Concentric that they generally have a shorter expected life. AMI meters may be retired due to changes in AMI technology (ie. AMI meters using cellular technology may need to be retired if the

underlying cellular technology changes), battery constraints, necessary upgrades to encoder receiver transmitters, and a variety of other technological limitations. As such, it is necessary to assign a shorter average life to ensure all technological changes are considered.
