Answer to Interrogatory from
Consumers Council of Canada (CCC)

Interrogatory

Reference:

Ex. 4/T1/S1/Attachment 1

Question(s):

Please provide all 2022 actual Operating Expense and O&M numbers when they become available.

Response:

Please see response at Exhibit I.4.1-EP-58, Attachment 1 for 2022 actual Operating Expenses.

Please see response at Exhibit I.1.1-SEC-74, Attachment 1 for 2022 actual O&M.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Energy Probe Research Foundation (EP)

Interrogatory

Reference:

Exhibit 4, Tab1, Schedule 1, *Table 2 Operating Expenses*

Question(s):

- a) Please provide a copy of Table 2 that shows for 2019-2024 the year over year percentage increase and the total,
 - i. for line 2 OM&A costs,
 - ii. the Total Operating Cost.
- b) Please provide OEB approved inflation factors for each of historic years.
- c) Please provide a schedule that shows OM&A and Total Operating costs to costs based on OEB inflation factors from 2019-2024.
- d) Please discuss in detail why OM&A and Total Operating costs exceed inflation in most years, while EGI is supposed to be providing lower costs due to amalgamation.

Response:

- a) Please see Attachment 1 for the year-over-year percentage and total increase for O&M and total operating costs as provided at Exhibit 4, Tab 1, Schedule 1, Table 2, updated March 8, 2023. 2022 Actuals have also been provided at Attachment 1.
- b) The historic OEB-approved inflation factors that were used within Enbridge Gas's price cap index (PCI) are included in Table 1.

Table 1
Price Cap Index

Year	2019	2020	2021	2022	2023
Inflation Factor	1.37%	1.61%	2.00%	1.70%	3.90%

- c) Please see Attachment 2 for schedule that shows 2019 to 2023 O&M and total operating costs as filed compared to costs based on OEB inflation factors.

Total operating costs in Exhibit 4, Tab 1, Schedule 1, Table 2, include Gas Supply related costs. Changes in Gas Supply costs are driven by OEB-approved reference prices rather than inflation. Accordingly, the total operating costs in Attachment 2 were normalized by excluding gas supply costs. In addition, DSM costs have been removed from total operating costs and O&M since DSM costs are approved in a separate filing.

Enbridge Gas is unable to provide 2024 comparatives since the 2024 OEB inflation factor has not been released.

- d) The OEB-approved inflation factor is determined using the average annual change in the GDP IPI FDD calculated on a two-year lag (for example the OEB inflation factor in 2022 is based on 2020 data). Therefore, in a period of rising inflation, actual costs would be expected to increase by more than the OEB inflation factor in a given year.

The main component of total operating costs that is impacted by inflation is O&M. Please see Exhibit 4, Tab 4, Schedule 1, paragraphs 13 to 17 and Figure 1 for a comparison of Utility O&M to GDP IPI FDD and PCI¹, including the impact of integration costs and synergy savings over the deferred rebasing term.

Gas Supply related costs are driven by OEB-approved reference prices rather than inflation.

Depreciation expense is driven by the timing and cost of assets placed into service and retirements rather than inflation.

¹ OEB-approved inflation less a stretch factor

Table 2
Utility Operating Cost Summary - EGI

Line No	Particulars (\$ millions)	Utility	2019	2020	2021	2022	2023	2024

Please update the tables on pages 3 and 4 to reflect actual data for 2022 as well as the corrections noted in the EGI letter of January 27, 2023.

Response:

Please see response at Exhibit I.4.1-LPMA-27, Attachment 1 for the update of tables included in Exhibit 4 for preliminary actual data for 2022, including Exhibit 4, Tab 1, Schedule 1, Attachment 1, pages 3 and 4.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 2, Schedule 1, pp. 14-15

Question(s):

Enbridge Gas holds third-party transportation contracts that are used to meet in-franchise demands on the distribution system for both sales service and DP customers. Enbridge Gas proposes to allocate the costs of these transportation contracts to in-franchise rate classes for recovery in delivery rates consistent with the purpose of the contracts. This proposal is consistent with the former Union Gas's approach for the cost of the two St. Clair Pipeline LP contracts that are recovered in in franchise delivery rates. In Table 3, Enbridge Gas has provided a list of these third-party contracts. One of these contracts is the Dawn to Union ECDA contract required by TransCanada to maintain flow into Enbridge Gas's system in Burlington.

- a) Please explain why a contract that is required by TransCanada to maintain flow into Enbridge Gas's system should be recovered in in-franchise delivery rates.
- b) Please confirm that volumes flowing as a result of the Dawn to Union ECDA contract is used to meet in-franchise demands on the distribution system.

Response:

- a) TransCanada has indicated that there must be a sufficient amount of firm contracted transportation capacity to the Union ECDA delivery area in order to justify their continued maintenance of the meter stations into the Union ECDA. Without these meter stations, the Union ECDA would lose key physical backstopping interconnections with TransCanada that would reduce the security of supply for all customers in this area.

Enbridge Gas is proposing to recover the costs of this contract in in-franchise delivery rates as the costs are incurred to ensure continued supply into the distribution system. By recovering the costs in delivery rates, the costs are recovered from all in-franchise customers. If Enbridge Gas recovered the costs in gas supply commodity or gas supply transportation rates, the cost would be

recovered from a subset of in-franchise customers¹. Recovery of the cost of the Dawn to Union ECDA contract in delivery rates is consistent with the current cost recovery of the two St. Clair Pipeline LP contracts in the Union rate zones.

b) Confirmed.

¹ Gas supply commodity charges are recovered from sales service customers. Gas supply transportation charges are recovered from sales service and bundled direct purchase customers.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 2, Schedule 3, pp. 1-2

Question(s):

Enbridge Gas as the provider of last resort, endeavours to size its pipeline systems to minimize the risk of failure in its ability to deliver gas to its customers. Customers are inherently risk averse and expect to be able to heat their homes and operate their businesses on the coldest day.

Please indicate the number of times that Enbridge Gas (former EGD and Union Gas) has had a major outage in the past 20 years during cold days, the cause of the outage and the number of customers impacted.

Response:

Enbridge Gas (formerly EGD and Union) has not experienced a major outage during cold days in the last 20 years.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 2, Schedule 3, pp. 3-4 and p. 33

Question(s):

EGD used a probabilistic method with one in five-year recurrence level to determine the design day. The EGD method was specifically designed for gas supply planning functions, which was to support contracting for space on upstream transportation systems. Enbridge Gas has proposed to adopt the method used by the former Union Gas with certain modifications, to determine the design criteria. Enbridge Gas has proposed that the design criteria be determined using the coldest day on record, as measured by heating degree days for a specified timeframe, adjusted for wind speed (set temperature method). The proposed harmonized method increases the design day demand by 0.4% or 34 TJ/day and includes an increase of 113 TJ/day in the EGD CDA offset by decreases in the EGD EDA, Union North and Union South rate zones of 17 TJ/day, 17 TJ/day and 44 TJ/day respectively. As a result of the proposal to use the Union Gas design day demand method, there are no incremental transmission or storage facilities required to serve the design day demand as the process was refined but did not materially change.

- a) Please confirm if EGD was unable to deliver natural gas to its customers on a cold day within the former EGD CDA at any time in the past 20 years. If yes, please provide details and the cause of disruption.
- b) If Enbridge Gas has been able to meet its requirements within the former EGD CDA, why is an increase in the design day demand of 113 TJ/day reasonable?
- c) Enbridge Gas has noted that the net increase of 34 TJ/day will not require incremental transmission or storage facilities. Please explain how the additional design day demand of 34 TJ/day will be met.
- d) Enbridge Gas has noted that harmonization of the design day methodology will lead to a decrease in the design day demand in the EGD EDA, Union North and Union South. Please explain if Enbridge Gas proposes to de-contract for transportation capacity within certain delivery areas to account for the decrease in design day demands.

- e) Please outline the impact on the Enbridge Gas distribution system if the existing design day demand methodology is continued.

Response:

- a) EGD had zero instances in the past 20 years where it couldn't deliver natural gas to its customers during cold days within the former EGD CDA.
- b) Yes, Enbridge Gas feels this is appropriate in its effort to find a harmonized approach that balances the needs of the customer during a very cold weather event. The increase of 113 TJ/day in the EGD CDA is offset by a decrease of 79 TJ/day in the EGD EDA, North and South rate zones. The increase in the EGD CDA is just as relevant and appropriate as the decrease in the other zones as Enbridge Gas strives to harmonize its methodologies. Enbridge Gas is proposing a comprehensive harmonization method to align all planning functions and the coldest day on record is just one aspect of that proposal. Please see response at Exhibit I.4.2-FRPO-118.

It is Enbridge Gas's opinion that regardless of the method chosen, the design criteria must align to the coldest weather that the customer may experience in their region. This is due to the critical nature of the service the gas system provides to protect customers and property from the impact of system outages during very cold weather.

Enbridge Gas must harmonize its internal processes (see part e)).

The proposed design criteria and design demand methods are the best approach because the methods:

- Align with the no failure approach by using the coldest day experienced.
- Meet customer expectations of reliable service during very cold weather.
- Protect granular customer information.
- Provide comparable data for regulatory reporting and to understand impact of developing technologies and energy transition.
- Being aligned with common design methods allows for clarity when studying and adopting an energy transition future
- Align with the integrated nature of the pipeline and storage assets.
- Are supported by third party consultants.
- Are a proven method in use for over 40 years and accepted by the OEB.

Simply put, when planning for integrated solutions, the Company must "speak the same language" and "be on the same page" across all planning functions. This is especially true of the distribution systems where the legacy utility assets are becoming directly connected to each other. For example, Oakville (South rate zone)

is now interconnected with Mississauga (Enbridge CDA). Due to the integrated nature of these facilities, the underlying processes to estimate the design demand (both design day and design hour) and determine the design criteria used to design the gas supply, storage, transmission, and distribution assets also need to be harmonized.

Enbridge Gas is the supplier and service provider of last resort and customers expect natural gas service will be available during very cold weather events. Customers are concerned about being negatively affected due to the loss of natural gas service. The harmonized method needs to consider the distribution system the most, where issues like customer demand exceeding the system capacity cannot be mitigated.

- c) Details on how Enbridge Gas plans to manage changes to the design day demands within the Gas Supply Plan are provided at Exhibit 4, Tab 2, Schedule 1, pages 11 to 12.
- d) The decrease to 2024 design day demand in the EGD EDA, Union North, Union South will not require de-contracting of TCPL FT transportation services. Instead, the proposed reduction in design day demand can be managed through other flexibility provided by the gas supply portfolio, including decreased use of LNG in Union North, decreased use of Dawn Parkway in Union South, and the diversion of FT services from the Enbridge EDA to the Enbridge CDA to serve increased design day in that delivery area.
- e) Please see response at Exhibit I.4.2-FRPO-118 for details on the impact the engineering assumption adjustments have on the EGD distribution system.

A continuation of the two previous design demand processes would result in dissimilar treatment of risk across customers within Ontario. The EGD method has less risk in the design demand development and more risk in the design criteria (design degree day) development whereas the Union method is the opposite. Without harmonization it will be impossible to connect systems together to obtain integration advantages where they have two very different design methods. As explained in response Exhibit I.4.2-FRPO-118, there are 5 key engineering assumptions that were previously not included for the EGD customers on the distribution system. These assumptions are improvements to developing design demand that aligns with actual consumption. These assumptions, which includes load trueing, peak hour factor adjustment, contract rate customer alignment, commercial customer diversification and general service forecast demand adjustments, would not be adopted.

The proposed method better aligns the development of customer demand with actual consumption and places the risk component on the weather assumptions.

Additionally, without harmonization, a misalignment in weather and design demand assumptions would exist between distribution, transmission, and gas supply with a potential consequence of not having sufficient assets or volumes to provide the energy our customers required. It would also require a portion of the cost savings identified in the AMP to be removed and projects reinstated causing an increase in the reinforcement budget forecast. Please also see response at Exhibit I.1.10-STAFF-33.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 2, Schedule 3, pp. 21-22

Question(s):

In Figure 1 on page 21, Enbridge Gas illustrated the hourly demand change over the design day. Enbridge Gas notes that customers typically consume gas in a diurnal pattern, low at night when people are sleeping and higher during the day when people are active. As the morning hour approaches, gas use increases to heat buildings and gas burning appliances such as hot water heaters. This usage peaks around 8 a.m. along with a secondary smaller increase in the late afternoon and early evening.

- a) Please confirm if the above trend has shifted post COVID with work from home and flexible work arrangements. Is there a softening of the Design Hour Demand during the peak period?
- b) Please provide a figure that shows the hourly demand change over the design day in 2020 and 2021 (coldest day in 2020 and 2021).

Response:

- a) No clear trend in customer hourly usage data has been observed as the result of COVID-19.
- b) A sample of three systems that are representative of the geographic region that Enbridge Gas serves are shown in Figures 1 to 3 as dimensionless profiles. These profiles represent the peak flow factor through these systems using actual recorded data on the coldest day in 2020 and 2021 with the temperatures noted in the legend. As provided at Exhibit 4, Tab 2, Schedule 3, the system peaks around 8 a.m. with a secondary smaller increase in the afternoon.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 2, Schedule 3, Attachment 1, pp. 11-14

Question(s):

Enbridge Gas engaged Guidehouse to conduct a comparative analysis of utility common practices for design day demand modelling, used for Gas Supply Planning in upstream contract sizing. One of the utilities that Guidehouse discussed was National Grid. National Grid uses the probabilistic approach to Design Day for its gas utilities serving Boston and Rhode Island, where the Design Day standard is based on once-in-35 years probability of occurrence of extreme weather conditions in Boston and once in 58.92 years in Rhode Island. In the Boston Gas and Rhode Island service territories, National Grid conducts a cost-benefit analysis that considers cost and risk of an outage compared to levels of investment in infrastructure and other solutions as part of its gas supply planning process.

To confirm its Design Day selection, National Grid Boston Gas uses the following approach:

1. Perform a statistical analysis of the coldest days recorded over a historical period.
 2. Conduct a cost-benefit analysis to evaluate the cost of maintaining the resources necessary to meet Design Day demand versus the cost to customers of experiencing service curtailments.
 3. Identify a design day standard that would maintain reliability at the lowest cost.
- a) Please provide Enbridge Gas's opinion on the approach to Design Day used by National Grid Boston Gas.
 - b) Did Boston Gas need to curtail supply as a result of its approach to Design Day on a very cold day within the last 30 years? If yes, please provide details.
 - c) Has Enbridge Gas conducted a cost-benefit analysis to evaluate the cost of maintaining the resources necessary to meet Design Day demand versus the cost to customers of experiencing service curtailments, at least, as it pertains to interruptible customers?

Response:

a) Synopsis of National Grid Boston Report – as it Relates to Design Day Standards

In the source document provided in the Guidehouse report National Grid Boston Gas' regulatory framework states it has an obligation to provide the lowest possible cost gas service while maintaining safe, and reliable service¹.

In the Massachusetts Department of Energy and Environmental Affairs' (Department's) decision in Eversource's Long Range Plan², the Department stated that it will no longer require companies to file a cost-benefit analysis for its planning standards with its future gas supply plans.

In 1995, the Department required local gas distribution companies ("LDC") to file cost-benefit analyses with their Plans to facilitate a full understanding of the cost implications of the Company's design standards. ... The analysis focuses on the marginal cost of damage associated with the supply outages compared to the marginal cost incremental capacity required to avoid supply disruptions, with the optimal standard found where the two costs are equal.

...the study offered too wide a range of standards to be useful in setting a specific standard, but instead relied on a combination of precedent, business judgment, and historical weather data to select the design winter and design day standards...

The Department agrees that the wide range of design standards produced by the cost-benefit analysis is not useful in this context. Moreover, the degree of uncertainty associated with estimating the cost of disruptions opens the cost-benefit analysis to subjective judgement, which limits the additional insight that such an analysis can provide.

Furthermore, the Company states that implementation of the cost-benefit analysis has not had a great impact on the selection of its design standards in this or previous filings (Tr. at 52-53). We note that the value of the study is primarily in its use as a check on the Company's design standards. Accordingly, for administrative efficiency, the Department will longer require the Company to file a cost-benefit analysis with its future plans. The Company may continue to build its design-year and design-day standards from the historical weather data and include a cost-benefit analysis only if such analysis is necessary to support the proposed design standards.³

¹ D.P.U. 18-148, October 30, 2020, p.3,
<https://fileservice.eea.comacloud.net/FileService.Api/file/FileRoom/12842605>

² D.P.U. 16-40, March 23, 2017.
<https://fileservice.eea.comacloud.net/FileService.Api/file/FileRoom/9186846>

³ Ibid, pp.9-10.

National Grid reviewed their coldest day each year and noticed a distinct downward trend in its coldest day of the year (reduced 1 effective design day (EDD) per 7 years) but with an increase in the coldest day of the year from 2013 to current.

Similarly, the Company reviewed its EDD database for the coldest day each year. While there will be variations in coldest days, there is a distinct downward trend in its coldest day of the year for the Boston/Logan (KBOS) weather station until 2013 (Figure 11). Since that time, the trend has switched to a higher level. This led to uncertainty in the possibility of a long-term declining trend in the colder days which tends to agree with discussions in the scientific community that there can continue to be severely cold outbreaks in the midst of an overall warming of the climate.⁴

National Grid, states that weather history would indicate the design day EDD should be raised to a 1:44.5-year probability (78.6 EDD) which would raise the EDD from 78 to 79 F (as they round to single digits). But considering climate change as well as the lack of clear evidence due to the recent increase in the coldest days, the company chose to complete a voluntary cost-benefit analysis to assist in the decision making.⁷⁵

The analysis, translated the supply shortfall into an equivalent number of customers, and then applied costs including the utility cost to relight (\$1,069 US) and an average damage cost per house (\$25,186 US) and cost for one⁶ day of service interruption to commercial and industrial customers. The costs for adequate supply delivery assets were included but the cost of incremental distribution assets was not.⁷

The review of coldest days resulted in a 78.6 EDD (1:44.5) and the cost benefit analysis resulted in 78.4 EDD (1:41.3) but because they only use integer values, National Grid chose to round down to 78 EDD (1:35 recurrence interval).⁸

Enbridge Gas's Opinion – as it Relates to Design Day Standards

Enbridge Gas's proposed design criteria and design demand methodology are focused on the needs of the transmission and distribution systems to ensure that there is sufficient infrastructure available to avoid a situation where the customer demand exceeds pipeline capability to serve it. The distribution system pipelines cannot mitigate a situation where customer demand exceeds the pipeline's capacity.

⁶ One day outage for commercial and industrial customers may be underestimated.

⁷ Ibid, pp.96-97.

⁸ Ibid, p.97.

Enbridge Gas's proposed approach is reasonable and in alignment with the regulatory framework to provide a safe and reliable service at a reasonable cost. This is very different to National Grid's regulatory framework of least cost.

Enbridge Gas's proposed method is proven, OEB accepted, and used by a majority of North American gas utilities. It is clear, simple, and repeatable and suitable for both pipeline infrastructure planning and the day-to-day operational functions of the utility.

Enbridge Gas, as supplier of last resort, does not download the cost and risk of lack of infrastructure onto customers and society. Enbridge Gas provides a critical service to customers. This service is designed not to fail. Customers have not indicated or have been specifically consulted if they are willing to assume and accept the damage that could occur.

National Grid's (Boston) regulator has stated the cost-benefit analysis does not provide a lot of clarity in the choice of the heating degree day. The cost-benefit analysis does not consider societal costs, the ability of the communities to manage customer outages, the amount of time and human power it will take to make safe and relight customers and repair the resulting damage, disruption to the economy, nor the potential for loss of life. Many of these items are difficult to place a cost on.

It is difficult to compare National Grid in Boston to the Province of Ontario in terms of the impact outages can have. While National Grid in Boston and Enbridge Gas may have a similar number of customers and reside in a similar weather zone, Massachusetts has a higher population density than most of Ontario. Ontario has a vast geography with many smaller remote communities predominantly using natural gas for space heating. A gas system outage means there may be limited to no heat in buildings (including hospitals) across the community. Extreme weather and geography may limit the ability for customers and patients to relocate to other communities for emergency shelter.

As example, consider the recent winter storm Elliott, which occurred December 23 to 25, 2022, and its impact on travelers and the residents of Chatham-Kent, Ontario^{9,10}. Highways 401 and 402 were closed and impassable with multiple multi-vehicle crashes and stranded motorists. The municipality declared a state of emergency as blizzard conditions made conditions so poor that snowplows were pulled off the roads further stranding motorists and emergency response vehicles. If the natural

⁹ CTV News Windsor. (2022, December 24). Chatham-Kent declares state of emergency following Friday snowstorm. <https://windsor.ctvnews.ca/chatham-kent-declares-state-of-emergency-following-friday-snowstorm-1.6208168>

¹⁰ Chatham Daily News. (2022, December 23). Winter storm wreaks havoc across Chatham-Kent. <https://www.chathamdailynews.ca/news/local-news/winter-storm-wreaks-havoc-across-chatham-kent>

gas system also failed during this extreme weather event and homes and businesses had no heat, movement to warming centers in other communities would be restricted, and emergency response vehicles may not be available. In addition, relights would be difficult given the travel restrictions and unsafe roadways.

- b) Enbridge Gas does not have the requested information.
- c) No. As provided at Exhibit 4, Tab 2, Schedule 3, page 24, paragraph 51, part h), iv., and paragraph 60 Enbridge Gas's proposed design demand method processes assume interruptible demand is curtailed on design day and design hour.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 2, Schedule 6; EB-2019-0294, Exhibit B, Tab 1, Schedule 1, p. 17

Question(s):

In its decision on Enbridge Gas's Low Carbon Energy Project application, the OEB approved the request for a rate rider to compensate customers in the blended gas area for the additional extra costs associated with the increased volumetric requirements for blended gas as compared to conventional natural gas. As part of its request, Enbridge Gas stated that it would absorb the costs associated with the rate rider during the deferred rebasing period.

Consistent with the decision in Enbridge Gas's Voluntary RNG Program,⁵ the OEB approved the costs for the rate rider to flow through the Earnings Sharing Mechanism (ESM) calculation. The OEB stated that it understands that there is a possibility that all customers will bear a portion of these costs if Enbridge Gas's earnings reach a level that require them to be shared with customers.

Please explain how Enbridge Gas proposes to manage the costs of the rider after rebasing. In particular, does Enbridge Gas propose to continue to absorb the costs associated with the rate rider after rebasing?

Response:

Enbridge Gas is proposing to continue to absorb the cost associated with the rate rider to the end of the 5-year pilot term of LCEP Phase 1. Enbridge Gas may propose an alternative treatment for LCEP Phase 2 when it files a leave-to-construct application for that phase of work at a future date.

Question(s):

Enbridge Gas provides information on its near-term plans related to hydrogen and highlights are provided from the Canada's Hydrogen Strategy and Ontario's Low-Carbon Hydrogen Strategy.

In terms of hydrogen that is suitable for Enbridge Gas to distribute to its customers:

- a) Please provide a forecast of hydrogen production and demand in (i) Ontario, (ii) Canada and (iii) North America.
- b) Please provide a forecast of the market price for hydrogen in (i) Ontario, (ii) Canada and (iii) North America.

Response:

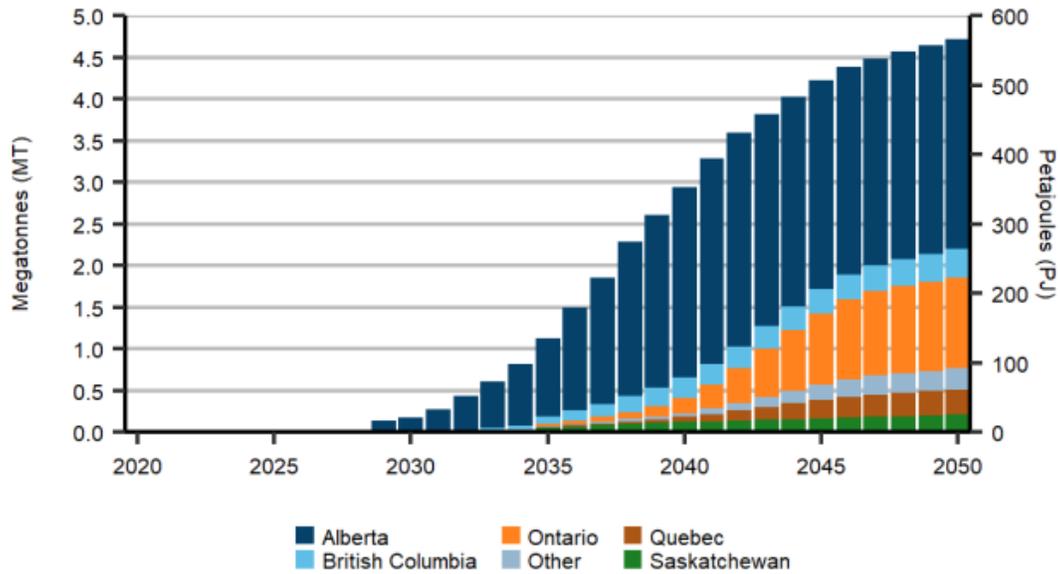

- a)
 - i.-ii. Figure 1 and Table 1 provide a forecast of hydrogen demand.¹

³ Canada's Energy Future 2021 Report, R.30, <https://www.cer-rec.gc.ca/en/data-analysis/canada-energy-future/2021/access-explore/figures.xlsx>

On a national level the Canada's Energy Future 2021 report states: "Given that we assume hydrogen is produced to meet local demands (with no international or inter-provincial trade), hydrogen production aligns with demand. Accordingly, in the Evolving Policies Scenario, Canada produces 4.7 MT of hydrogen by 2050"⁴.

iii. Enbridge Gas does not have data available for North America and is not familiar with a reliable source.

b)

i.-iii. Due to the nascent nature of the hydrogen market, true market prices are not readily available.

Canada's Hydrogen Strategy offers projected hydrogen production costs based on a range of studies,⁵ however these values are only available at the national level.

Enbridge Gas does not have a reliable source for hydrogen pricing/costs at a provincial or North American level.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 2, Schedule 6, Pages 9 and 10; Exhibit 4, Tab 3, Schedule 1, Page 1;
Exhibit 4, Tab 3, Schedule 1, Attachment 3, Page 2

Question(s):

Enbridge Gas states that studies indicate that the current distribution system may be suitable for up to 5% hydrogen by volume with relatively minimal changes. Minimal changes could include enhanced leak management practices, recalibration of existing equipment and prioritized repair or proactive replacement of identified assets in order to mitigate the potential for future leaks. Based on current knowledge, Enbridge Gas's systems may require substantial changes above 20% hydrogen by volume.

In its evidence, Enbridge Gas has defined unaccounted for gas (UFG) to describe the loss of gas from distribution, transmission, and storage. The main sources of UFG included retail meter variations, gate station meter variations, leaks, fugitive emissions, third-party theft, company use and accounting adjustments.

- a) Please discuss and quantify the permeability of steel and plastic pipeline systems to hydrogen relative to conventional natural gas.
- b) Does the permeability of hydrogen referred to in part (a) change depending on the concentration of hydrogen that is blended with the conventional natural gas? Please explain.
- c) Please discuss and quantify the impact of hydrogen blending on UFG.
- d) Please comment on (and quantify, if possible) the impact of UFG on a typical residential customer's annual bill in the EGD rate zone resulting from a 20% hydrogen blend

Response:

- a) Permeability through a pipe wall varies with respect to service and pipe material. Permeation in metals does not occur in the same manner as in plastics due to differences in the material's microstructures.

Permeation through steels requires molecular hydrogen to dissociate at the material surface, adsorb and pass through the microstructure of the steel, followed by reassociation and desorption of the molecules on the outside surface. Permeation from an emissions or gas loss perspective through steel is considered negligible for both natural gas and hydrogen.

In the case of plastic materials, both hydrogen and natural gas can permeate through the material in its molecular form. The rate of permeation through plastic materials depends on several factors, including the crystallinity, specific resin type, operating temperature, and pressure. Due to the variation in factors, an engineering assessment for a pipeline system is important to help quantify any system specific increases in permeability due to hydrogen. Engineering assessments use the most recently available and credible research at the time of their assessments which is important because hydrogen and its behaviour with materials is still a developing field. Enbridge Gas has proposed to undertake a full system study called the Hydrogen Blending Grid Study to analyze its gas grid and in doing so validate parameters such as these as provided at Exhibit 4, Tab 2, Schedule 6, pages 16 to 18.

- b) Increasing the hydrogen concentration does not impact the permeability of hydrogen. The permeation rate of a hydrogen blend gas may increase as the percentage of hydrogen increases due to hydrogen's relatively smaller molecular size compared to methane. Engineering assessments can identify permeation behaviour of a hydrogen blend gas and recommend any modifications.
- c) Enbridge Gas believes the UFG impact of hydrogen blending to be minimal. A study undertaken by Air Liquide and presented in compiled findings by the European Union in a report entitled *Hydrogen Emissions from A Hydrogen Economy and Their Potential Global Warming Impact*¹ presents the relatively low estimated hydrogen losses in building heat and power relative to other end uses:

Air Liquide estimated the potential overall hydrogen losses to the atmosphere by combining the hydrogen losses data with the expected hydrogen demand. Results are presented in Table 3. ...[see below]...For hydrogen demand, 140 Mt are assumed to be needed in 2030, and 660 Mt in 2050 (Hydrogen Council and McKinsey & Company,

¹ Hydrogen Emissions from A Hydrogen Economy and Their Potential Global Warming Impact, August 19, 2022, <https://op.europa.eu/en/publication-detail/-/publication/918b0980-21c7-11ed-8fa0-01aa75ed71a1>

2021). The figures in Table 3 are calculated assuming that all the end uses except for mobility are supplied by pipelines, while transportation is covered for 70% by liquefied hydrogen and 30% by compressed hydrogen.²

Table 3. Potential hydrogen losses from the deployment of hydrogen at scale.

End-use	Unit	2020	2030	2050
Power generation buffering	Mt	0	0.18	0.47
<u>Transportation</u>	<u>Mt</u>	<u>0.02</u>	<u>0.20</u>	<u>10.6</u>
<u>Building heat and power</u>	<u>Mt</u>	<u>0</u>	<u>0.07</u>	<u>0.80</u>
Industry feedstock	Mt	1.08	0.73	1.46
Total losses	Mt	1.10	1.18	13.3
Share losses of hydrogen produced	%	1.2	0.8	2
Share industry losses of hydrogen sources	%	1	1	10

Source: adapted from presentation by G. de Reals (Air Liquide)

The study concludes that "...by 2050, hydrogen lost to the atmosphere would represent approximately 2% (i.e., 13 Mt) of all the hydrogen produced."³

- d) Enbridge Gas is unable to estimate the impact of UFG on a typical residential customer's annual bill in the EGD rate zone resulting from a 20% hydrogen blend, subject to further analysis on Enbridge Gas's system. Enbridge Gas's proposed Hydrogen Blending Grid Study will include as a portion of its scope a study of sources and estimated amounts of UFG and recommendations for any modifications to the system to minimize fugitive emissions and leaks.

² Hydrogen Emissions from A Hydrogen Economy and Their Potential Global Warming Impact, August 19, 2022, p.17, <https://op.europa.eu/el/publication-detail/-/publication/918b0980-21c7-11ed-8fa0-01aa75ed71a1>

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 2, Schedule 6, p. 12

Question(s):

Enbridge Gas provides an update on Phase 1 of its Low Carbon Energy Program.

- a) What volume of hydrogen has been delivered to date to customers located within the blended gas area?
- b) What would the volume of hydrogen have been if Enbridge Gas had used 5% hydrogen by volume?
- c) What would the volume of hydrogen have been if Enbridge Gas had used 20% hydrogen by volume?

Response:

- a) The volume of hydrogen delivered from October 2021 to January 2023 is 177,000 m³. This amounts to 1.13% on average of total blended gas volume consumed by the network. Based on the energy delivered between October 2021 to January 2023, the volume of hydrogen at 2% by volume blend would be 316,000 m³.
- b) Based on the energy delivered between October 2021 to January 2023, the volume of hydrogen at 5% by volume blend would be 808,000 m³.
- c) Based on the energy delivered between October 2021 to January 2023, the volume of hydrogen at 20% by volume blend would be 3,612,000 m³.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 3, Schedule 1, pp. 7-9

Question(s):

Based on its analysis, Enbridge Gas has noted that the 3-year simple average methodology results in the smallest forecast error. It is therefore the most accurate forecast when using the last five years of actual Unaccounted for Gas (UFG) data (historical UAF volumes for the EGD rate zone and historical UFG volumes for the Union rate zone). In this application, Enbridge Gas has recommended a 3-year simple average methodology for the determination of the forecast for UFG volumes for the amalgamated utility starting in 2024.

- a) Please confirm that in case of an outlier year of UFG volumes, a 5-year or 7-year average would provide a better forecast for UFG volumes as compared to a 3-year average.
- b) Please indicate if Enbridge Gas examined a longer period to determine the average volumes for UFG such as a 7-year average.
- c) Please use an example where there was a large variation in a specific year and use that year to derive a 3-year, 5-year and 7-year average. Please provide the results and an analysis.
- d) The 2024 Test Year forecast for UFG is \$56.1 million based on the proposed harmonized 3-year simple average forecasting methodology. Please provide the 2024 Test Year forecast amount related to UFG using a 5-year and 7-year simple average forecasting methodology.

Response:

The data used for comparison analysis in Exhibit 4, Tab 3, Schedule 1, Table 2 has been corrected. Please see Attachment 1 for the corrected data and the updated analysis. As noted in part b), additional scenarios have been added to the comparison analysis as requested. However, none of the utilities that Enbridge Gas reviewed in

Exhibit 4, Tab 3, Schedule 1, Table 1 utilized the 4- or 7-year average. The corrected data has not changed the recommended forecast methodology.

- a) Not confirmed. A longer sample would provide a more stable forecast but there is no guarantee that the longer sample will provide a more accurate forecast. Please see outcome of an example provided in part c).
- b) Enbridge Gas did not examine a longer period such as a 7-year average. Exhibit 4, Tab 3, Schedule 1 paragraph 9 indicates that the following methodologies were considered: the 3-year weighted average of throughput ratio and single equation regression methodologies currently used by Enbridge Gas as well as the 3-year simple average of actual UFG volumes and the 5-year simple average of actual UFG volumes. To be responsive to this question, the 7-year average is added to comparison analysis, and results can be found in Attachment 1, Table 1. A 4-year average has also been added in response at Exhibit I.4.3-LPMA-29.
- c) Enbridge Gas does not believe looking at only one specific year's accuracy results would have been appropriate. However, for this arbitrary example, 2017 data has been changed to a lower (1/2 times of actual) and a higher number (2 times of actual) and 2019 forecast has been developed using 3-year, 5-year and 7-year averages. Results are provided in Attachment 1, Tables 2 and 3.
- d) Please see Table 1 for the 2024 UFG forecast amount based on a 5-year simple average methodology, and Table 2 for the 2024 UFG forecast amount based on a 7-year simple average methodology.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 3, Schedule 1, pp. 19-20

Question(s):

Enbridge Gas has provided a list of measures as noted in the UFG Progress Report and the Supplemental UFG Progress Report.

Please confirm if Enbridge Gas has implemented these measures. For measures that have not been implemented, please provide a status update.

Response:

Many of the specific measures noted in the UFG Progress Report and Supplemental UFG Progress Report have been implemented and are part of ongoing operations, standard practices, policies, and procedures. Others are ongoing in nature, such as meter audits between interconnecting parties, participation in industry groups and associations and regular meetings of cross functional measurement groups.

There are specific measures that were identified in the UFG Progress Report and Supplemental UFG Progress Report that have not yet been implemented. A status update on those items have been provided below.

Updates relating to Exhibit 4, Tab 3, Schedule 1, Attachment 3:

The 2019 UFG Report included a recommendation to review automated meter reading (AMR) and advanced metering infrastructure (AMI) technology. Enbridge Gas has brought forward a proposal in the 2024 Rebasing Application regarding AMI. Please see Exhibit 2, Tab 7, Schedule 2 for an overview of how AMI is being considered for use within Enbridge Gas and a summary of Enbridge Gas's progress and activities related to developing an AMI proposal.

Enbridge Gas continues to update gas quality parameters during routine pressure regulation and measurement inspections, and progress remains on track to complete the update of gas quality parameters by 2025 as previously noted.

Enbridge Gas developed a three-year program to eliminate a backlog of leaks identified prior to the roll out of a new leak operating standard. The program will be completed by the end of 2023.

Updates relating to Exhibit 4, Tab 3, Schedule 1, Attachment 4:

In 2022, Enbridge Gas undertook an initiative to align the applications used for large volume customer meter measurement to ensure consistent volume measurement data validation for large volume customer meter measurement. Enbridge Gas continues to explore and test potential alternatives.

In 2022, Enbridge Gas initiated a system application change request to refine the reporting underpinning a portion of the unbilled sales estimates recorded at the end of every reporting period for financial accounting purposes. This system application change is under development.

Enbridge Gas is developing and implementing a Scope 1 and 2 GHG emission reduction strategy. The details of this work are provided at Exhibit 1, Tab 10, Schedule 8.

In addition to the actions outlined above, Enbridge Gas is establishing a team that will conduct an end-to-end process review of UFG and make changes to ongoing sustainment processes.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 3, Schedule 1, Attachment 3, pp. 3-9

Question(s):

UFG is broadly defined as the difference between gas receipts and gas deliveries. UFG also includes various accounting adjustments including unbilled sales adjustments, billing adjustments, line pack and other accounting related adjustments.

- a) Please provide the UFG volumes and percentage of throughput for the years 2019 to 2022 that excludes unbilled sales and billing adjustments.
- b) Has Enbridge Gas considered excluding unbilled sales adjustments and billing adjustments from the UFG calculation and capturing these adjustments through other approaches? Please explain your response.

Response:

- a) Please see Table 1 for the UFG volumes that exclude the unbilled sales adjustments for the Union rate zone. Unbilled sales adjustments recognize that the UFG volumes need to be adjusted for the true up that happens between estimated billed volumes (line 1) and actual billed volumes (line 2) relating to the prior year (line 5), as well as adjusting for the estimation variance for the current period (line 6). Total annual UFG volumes adjusted for estimation are show at line 7.

Table 1
UFG Volumes for Union Rate Zone Adjusted for Estimation Variances

Line No.	Particulars (10 ³ m ³)	2018 (a)	2019 (b)	2020 (c)	2021 (d)	2022 (e)
1	Estimated Unbilled Volumes (December 15-31)	526,416	540,214	531,070	441,068	467,655
2	Actual Billed Volumes (December 15-31)	526,318	491,515	484,587	437,434	423,240
3	Estimation Variance	(98)	(48,699)	(46,483)	(3,634)	(44,415)
4	UFG Volumes (1)		121,079	66,056	223,637	218,904
5	Estimation Variance for Prior Year (2)		(98)	(48,699)	(46,483)	(3,634)
6	Estimation Variance for Current Year (2)		48,699	46,483	3,634	44,415
7	UFG Volumes Adjusted for Estimation Variances		169,680	63,839	180,788	259,685
8	UFG Percentage of Throughput Unadjusted Volumes (line 4)		0.331%	0.185%	0.595%	0.517%
9	UFG Percentage of Throughput Adjusted Volumes (line 5)		0.464%	0.179%	0.481%	0.613%

Notes:

- (1) Refer to Exhibit 4, Tab 3, Schedule 1, Table 3, line 2.
- (2) Impact of estimation variances have not been adjusted for unregulated allocation.
- (3) Enbridge Gas's 2022 UFG Volumes are subject to ongoing analysis. Final balances will be included in Enbridge Gas's 2022 Utility Earnings and Disposition of Deferral & Variance Account Balances Application to be filed in 2023.

The calculation of the EGD rate zone UAFVA already excludes the unbilled sales adjustments from prior periods. The unbilled sales adjustment is recorded in the deferral account for the reporting period that it pertains to and no further adjustment is required for the EGD rate zone.

Enbridge Gas does not have data relating to billing adjustments across all customer markets and rate zones for the time period requested.

- b) Unbilled sales adjustments and billing adjustments do not represent physical gas losses, but rather represent timing variances within the calculation of UFG. It is not appropriate to remove these adjustments from the calculation of UFG as they are required to ensure the proper recognition of consumption volumes as part of the determination of UFG.

Enbridge Gas includes unbilled sales adjustments in the same reporting period as the estimated unbilled sales in the existing EGD rate zone Unaccounted for Gas Variance Account and has proposed the same treatment for the harmonized UFG Variance Account in this Application, as provided at Exhibit 9, Tab 1, Schedule 1, Attachment 3, page 7.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Consumers Council of Canada (CCC)

Interrogatory

Reference:

Ex. 4/T2/S1/p. 2

Question(s):

For the purposes of developing the 2024 Gas Supply Plan Enbridge Gas has used the most recent information available at the time of the filing of its Application, including the existing transportation and storage contracts in Section 1.4. To capture the costs of uncontracted assets, Enbridge Gas has included an estimate of costs associated with 2024 transportation and storage requirements. Any variances between actual transportation and storage costs are proposed to be captured in the respective deferral and variance accounts, which are provided at Exhibit 9, Tab 1, Schedule 2. Enbridge will not contract for these uncontracted assets until OEB approval is received.”

- a) Please describe the process that EGI proposes for OEB approval of the transportation and storage costs;
- b) What is the range of possible variances between forecast and actual transportation and storage costs?

Response:

- a) Please see response at Exhibit I.4.2-TCPL-7 part c).
- b) Enbridge Gas is not able to opine on the range of possible variances between forecast and actual transportation and storage costs. These costs are driven by various factors that are beyond the control of Enbridge Gas, including, but not limited to, changes in average and design day demand on a year-to-year basis, changes to the transportation rates of third-party providers, changes to the market price of storage services, and changes to the availability of transportation and storage service options to meet average and design day requirements.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Canadian Manufacturers & Exporters (CME)

Interrogatory

Reference:

Exhibit 4, Tab 2, Schedule 2, pp. 7-8 of 13

Question(s):

At page 7, EGI stated: “The proposed weighted average reference price is set based on the forecast gas supply costs. The costs incorporate the gas supply commodity from the various sources of supply in the gas supply portfolio and the transportation contracts for gas supply sourced upstream of Dawn or Empress to provide diversity of supply for sales service customers.”

- a) Please confirm whether EGI’s proposed weighted average reference price would have dynamic weighting (in that there would be periodic changes to the weighting as the gas supply mix changed throughout the plan period).

Response:

- a) Not confirmed. Enbridge Gas’s proposed weighted average reference price is based on the proposed 2024 Gas Supply Plan. The 2024 Gas Supply Plan will not be updated for changes in the gas supply mix throughout the IR term, consistent with the proposed price-cap incentive rate-setting mechanism and the current process for setting the PGVA reference price for the EGD rate zone. However, the derivation of weighted average reference price through QRAM will reflect a 21-day average of market settlement prices at each of the supply points that are set out in the 2024 Gas Supply Plan, as provided at Exhibit 4, Tab 2, Schedule 1.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Canadian Manufacturers & Exporters (CME)

Interrogatory

Reference:

Exhibit 4, Tab 10, Schedule 6, p. 10 of 20

Question(s):

At page 10, EGI stated: "In some situations, pipeline systems may be requalified to operate with 100% hydrogen. Full conversion to hydrogen will require substantial testing, validation, and upgrades to the system along with enhanced integrity management programs and significant operational changes to ensure continued safety and reliability. Moreover, because hydrogen has lower volumetric energy density compared to natural gas, existing networks will need additional capacity from pipe reinforcement, station replacements or other upgrades to account for the increased volume of hydrogen that will be required to meet energy demand from customers."

- a) As part of EGI's proposal, will hydrogen capable assets be reviewed as part of EGI's optionality assessments for leave to construct proceedings?
- b) If so, how does EGI propose to capture the benefits of hydrogen capable upgrades against the cost of construction?

Response:

a-b) Enbridge Gas believes its pipeline system may be compatible with hydrogen blends or pure hydrogen with modifications or perhaps no required modifications. The Hydrogen Blending Grid Study provided at Exhibit 4, Tab 2, Schedule 6, pages 16 to 18 will help identify and prioritize the sections of the gas grid most suitable for hydrogen blending and identify associated costs and benefits. The learnings from this study may be used for consideration of hydrogen-capable assets in future projects that meet leave to construct requirements. Enbridge Gas will continue to follow the Guidelines for Assessing and Reporting on Natural Gas System Expansion in Ontario as set out by the OEB.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Canadian Manufacturers & Exporters (CME)

Interrogatory

Reference:

Exhibit 4, Tab 2, Schedule 7, p. 14 of 24

Question(s):

At page 14, EGI stated: “Under the GGPPA as of October 2022, hydrogen has not been recognized as a means of lowering the quantity of marketable natural gas that is subject to the FCC, and as such will not currently be considered as part of this low-carbon energy procurement program.”

- a) Please confirm whether EGI is currently actively taking any steps with respect to hydrogen recognition, for instance, lobbying efforts or discussion with relevant government departments/ministries?

Response:

- a) Based on conversations with the Canada Revenue Agency in November 2022, it is now Enbridge Gas’s understanding that although the Greenhouse Gas Pollution Pricing Act (GGPPA) has not yet been amended to include the exemption of hydrogen, hydrogen can be exempted from the federal carbon charge as of August 2022 when draft amendments to the GGPPA were announced.¹

¹ Draft Regulations Amending the Fuel Charge Regulations, August 2022, p. 2, <https://fin.canada.ca/drleg-apl/2022/ita-lir-0822-d.pdf>

Answer to Interrogatory from
Canadian Manufacturers & Exporters (CME)

Interrogatory

Reference:

Exhibit 4, Tab 2, Schedule 7, p. 20 of 24

Question(s):

At page 20, EGI stated: "Enbridge Gas will reduce the FCC for these customers on their natural gas bills by an amount equal to the total annual amount of low-carbon energy elected by the customer."

- a) Has EGI forecast the potential premium price or a range of prices that the voluntary participants are likely for the use of low-carbon energy sources?
- b) If so, please provide that forecast price, and compare that to the FCC unit reduction that the customer would enjoy as a result of the use of low-carbon energy sources.

Response:

a-b) This issue will be addressed in Phase 2 of the proceeding in accordance with the OEB's Decision on Issues List dated January 27, 2023.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 4, Tab 2, Schedule 3 (Design Criteria)

Question(s):

- a) Please provide a table showing the forecast Dawn Parkway design day demand (per Exhibit 2, Tab 7, Schedule 1, Table 1) with columns for (i) the design day demand per that table and (ii) the design day demand calculated according to the probabilistic method currently used by EGD.
- b) Please provide a table listing the assumed temperature on the design day for each location/region for which Enbridge has a separate design day temperature assumption based on (A) the proposed methodology and (B) the current methodology.
- c) Please provide a map showing the locations/regions referred to in (b).
- d) Please reproduce Table 1 on page 18 replacing HDD with temperature.
- e) Is the design day temperature different from the design hour temperature? If yes, please provide a table listing the assumed temperature on the design hour for each location/region for which Enbridge has a separate design hour temperature assumption.
- f) What impact does Enbridge anticipate climate change having on the assumed design day temperatures?
- g) Please describe how Enbridge proposes to adjust the HDD for wind speed to arrive at the HDD_w (or effective degree days)? Please provide the formula. Are the results for the HDD_w similar to what would colloquially be known as the average of a day's temperature, accounting for "wind chill"?
- h) Enbridge states that "The proposed design criteria HDD_w for each of the weather stations are determined by selecting the highest observed HDD_w starting from November 1, 1979." Why was 1979 chosen?

- i) Please provide a full list of the current and proposed design day assumptions, such as that status of interruptible customers, demand from power generators, etc..

Response:

- a) Please see Table 1 and Attachment 1.

To answer this question, weather stations where a 1 in 5 recurrence interval has yet to be calculated, a HDDw analysis using a normal distribution was completed. The mean and standard deviation were calculated based on weather data since November 1, 1979. As the existing HDD for the Enbridge CDA (Toronto and St Catharine's) and EDA (Ottawa) are already a 1 in 5 recurrence interval, their HDD was reduced by 3 HDD to change them to a base temperature of 15°C as shown in Exhibit 4, Tab 2, Schedule 3, Table 1, column (f).

The design day demand was developed using the proposed design day demand method as detailed in Exhibit 4, Tab 2, Schedule 3, pages 23 to 24, paragraph 51.

The Dawn Parkway System design day demand information, as shown in Table 1, does not tell the entire story of how much risk would be associated if a 1 in 5 recurrence interval with no other assumptions applied was adopted as part of the harmonized methods. That is not the methodology currently used by either EGD or Union. Please see response at Exhibit I.4.2. FRPO-118 which explains the additional engineering and operational assumptions included with the current EGD determination of design day.

The response at Exhibit I.4.2. FRPO-118, Table 1 shows the design day degree day for a 1 in 5 recurrence interval with no additional assumptions applied. It also shows the number of days in the past ten years that the 1 in 5 recurrence interval would be exceeded. For example, the 1 in 5 recurrence interval in Toronto, has been exceeded 2 times in the past 10 years. If the remainder of the forecasting assumptions used by Union (which are less conservative than the existing EGD method as described in response at Exhibit I.4.2.FRPO-118) were adopted along with the 1 in 5 recurrence interval there could be situations every few years where the transmission and distribution systems capacity could be exceeded, and customer outages could occur.

Attachment 1 indicates, in Winter 2023/2024, the 1 in 5-year recurrence design day demand would be 472 TJ/d (line 14) lower than the proposed coldest observed methodology and 438 TJ/d lower than the existing method.

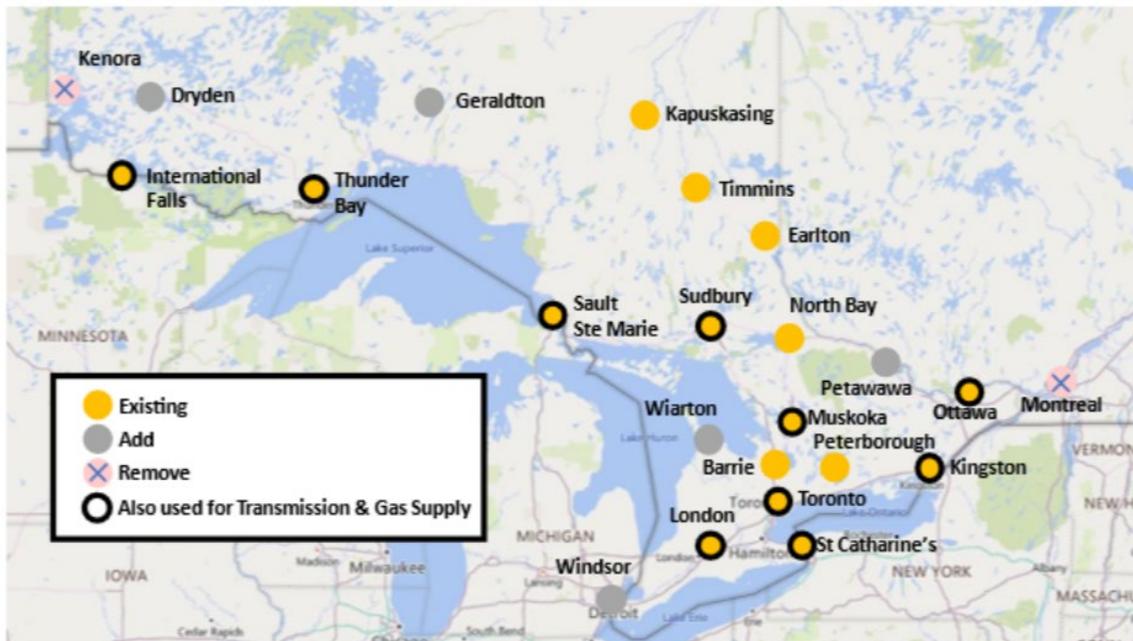

Table 1
Dawn Parkway Design Day Demand

Line No.	Winter (TJ/d)	Design Day Demand Coldest Observed (a)	Design Day Demand Unadjusted 1 in 5 (b)	Design Day Demand Difference (c)
1	2023/2024	7,892	7,710	182
2	2024/2025	7,766	7,587	179
3	2025/2026	7,992	7,824	168

20	Kapuskasing	-37.9	1/16/1982	-37.6	
21	Geraldton (3)	-38.4	1/27/2019		
22	Kenora (4)	-40.9		-37.9	

Notes:

- (1) Wind speed adjusted temperature
- (2) Temperature
- (3) New weather station.
- (4) Retired weather station.

- e) No, the calculation is the same and the daily HDDw is used for design day and design hour.
- f) It has been observed that the average winter temperature is slightly increasing over time, as shown in Figure 2 below as a declining HDDw, however the risk of extreme cold weather events continues to occur as shown in Figure 2. The dark blue line represents the coldest day each year in the available weather history. In recent history the coldest day is near the design HDDw.

Figure 2: London Weather Station Illustration of Weather Trends

Please see response at Exhibit I.4.2-ED-119, part b). Recent history has three weather stations (International Falls, Geraldton, and Windsor) that have observed a new design day HDDw in 2019. Other stations have been close to their design day HDDw. For example, London, shown in Figure 2, was 0.1 HDDw less than design day condition in January 2019.

g) As provided at Exhibit 4, Tab 2, Schedule 3, pages 15 to 16, paragraph 33, HDD is a measurement designed to quantify the demand for energy needed to heat a building. Factors other than outside temperature can affect the energy needed to heat a building. Wind speed increases the amount of energy needed to heat a building as the wind wicks away heat from the building envelope and can be considered similar to the impact of wind chill.

The equation to calculate the wind speed adjustment can be found in Exhibit 4, Tab 2, Schedule 3, pages 18 to 19, paragraph 39. Each hour's temperature data is adjusted for the impact of that hour's wind speed using a widely accepted method developed by Marquette Analytics. Using this method, the temperature is adjusted to account for wind speed based on the following equations:

$$HDD_w = \frac{(WS + 152)}{160} * HDD, WS < 8$$

$$HDD_w = \frac{(WS + 72)}{80} * HDD, WS \geq 8$$

Where:

HDD_w = heating degree days adjusted for wind speed

WS = wind speed

HDD = heating degree days

- h) Please see response at Exhibit I.4.2-ED-119, part a) for a discussion of why 1979 was selected as the first year for determining the sample used to determine the proposed design criteria.
- i) Please see Exhibit 2, Tab 7, Schedule 1, Sections 3 and 4. Section 3 is the design day information and Section 4 is the system operating criteria both of which provide information on the assumptions requested.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 4, Tab 2, Schedule 3 (Design Criteria)

Question(s):

- a) Enbridge states that “The proposed design criteria HDDw for each of the weather stations are determined by selecting the highest observed HDDw starting from November 1, 1979.” Why was 1979 chosen?
- b) The World Metrological Organization states as follows: “The U.S. National Oceanic and Atmospheric Administration has updated the U.S. Climate Normals to the 1991-2020 baseline period to provide a most recent baseline for climate information and services to climate-sensitive sectors and a standard reference to compare variations in temperature, precipitation etc to the 30-year average.” Does Enbridge agree?
- c) Please update Table 1 on page 18 if the proposed design criteria HDDw for each of the weather stations are determined by selecting the highest observed HDDw starting from 1991.

Response:

- a) Enbridge Gas uses Environment Canada hourly temperature and wind speed data records to calculate the HDDw. Most of the coldest HDDws occurred in January 1981, 1982, 1994, 2004, and 2019. Thunder Bay and Dryden were exceptions with coldest HDDws in 1966 and 1972. Since the coldest HDDw of these two weather stations occurred much further back in history than the design day of most other weather stations, it was decided to exclude these dates and fix the start date for selection of the design criteria at the Winter 1979/1980. This is a minimum of 40 years worth of data that includes the cold temperatures seen in the early 1980’s.
- b) No, Enbridge Gas’s Design Day assessment is not based on Climate Normals. Design Day is based on meeting customer needs during extreme cold weather events. Recent history, 2019, has three (Windsor, Geraldton, and International Falls) weather stations that have observed new design HDDw. There have been other

stations which have been very close to their Design HDDw, as an example, in January 2019 London was 0.1 HDDw less than design condition.

- c) Table 1 has been updated to reflect the scenario where the proposed design criteria HDDw for each of the weather stations were determined by selecting the highest observed HDDw starting from 1991 instead of 1979. Weather stations impacted by this scenario are bolded and the resulting HDDw (and occurrence date) are shown in bold within columns (a) and (b).

Table 1
Proposed Design Day HDDw

Line No.	Weather Station	Proposed		Existing ¹			
		EGI HDD _w (1)	Occurrence date	Union HDD _w (2)	Union HDD _w (1)	EGD HDD (2)	EGD HDD (1)

10	Ottawa	47.5	1/15/1994			48.2	45.2
11	Muskoka	48.5	1/15/1994	49.0	46.0		
12	Montreal (4)			49.2	46.2		
13	North Bay	48.0	1/15/1994	52.5	49.5		
14	Sudbury	47.2	1/15/1994	51.9	48.9		
15	International Falls	51	1/30/2019	54.7	51.7		
16	Earlton	51.3	1/2/2014	54.8	51.8		
17	Thunder Bay	48.4	2/1/1996	51.6	48.6		
18	Dryden (3)	51.8	1/17/1994				
19	Timmins	50.4	12/26/1993	55.7	52.7		
20	Kapuskasing	52.3	12/25/1993	55.6	52.6		
21	Geraldton (3)	53.4	1/27/2019				
22	Kenora (4)			55.9	52.9		

Notes:

- (1) Based on 15°C base temperature.
- (2) Based on 18°C base temperature.
- (3) New weather station.
- (4) Retired weather station.

¹ For clarity, the existing design criteria for Union and EGD use 18°C as the base temperature as shown in columns (c) and (d), respectively. The columns under “Existing” that include 15°C as the base temperature are provided for information to draw line of sight relative to the proposed HDD_w in column (a) for comparison.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 4, Tab 2, Schedule 3 (Design Criteria)

Question(s):

- a) Has Enbridge studied the likely impact of recent and ongoing climate change on the HDD on the coldest days in a year?
- b) Please provide any studies or analysis in Enbridge's possession regarding the potential impact of climate change on design day HDD assumptions.

Response:

a-b) No, Enbridge Gas has not conducted studies regarding the potential impact of climate change as it relates to the design day assumptions. Please see response at Exhibit I.4.2-ED-119 part b).

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 4, Tab 2, Schedule 3 (Design Criteria)

Question(s):

- a) Please confirm that Enbridge’s proposed design day HDDw for Toronto of 41.4 equates to an average daily temperature of -26.4°C, including a wind speed adjustment.
- b) Please complete the following table.

Coldest Day in Toronto Over Time			
	1979	...	2022
Average daily temperature (°C)			
Average daily temperature, adjusted for wind speed (°C)			
HDD (base 15)			
HDDw (base 15)			

- c) Please provide a chart with the data from the first two rows in the above table and a trendline for each row.
- d) Please complete the following table comparing the capacity of the pipeline system for Toronto based on the current and proposed design day assumptions and the actual measured peak day demand. Please choose an area that is feasible to model (ideally the area that would be designed based on Toronto weather data, if possible).

Design Day Capacity vs. Actual Peak Demand for Toronto Area			
	1979	...	2022
Capacity per current design day assumptions (TJ/d)			
Actual peak day demand (TJ/d)			

Capacity per proposed design day assumptions.			
---	--	--	--

Response:

a) Confirmed.

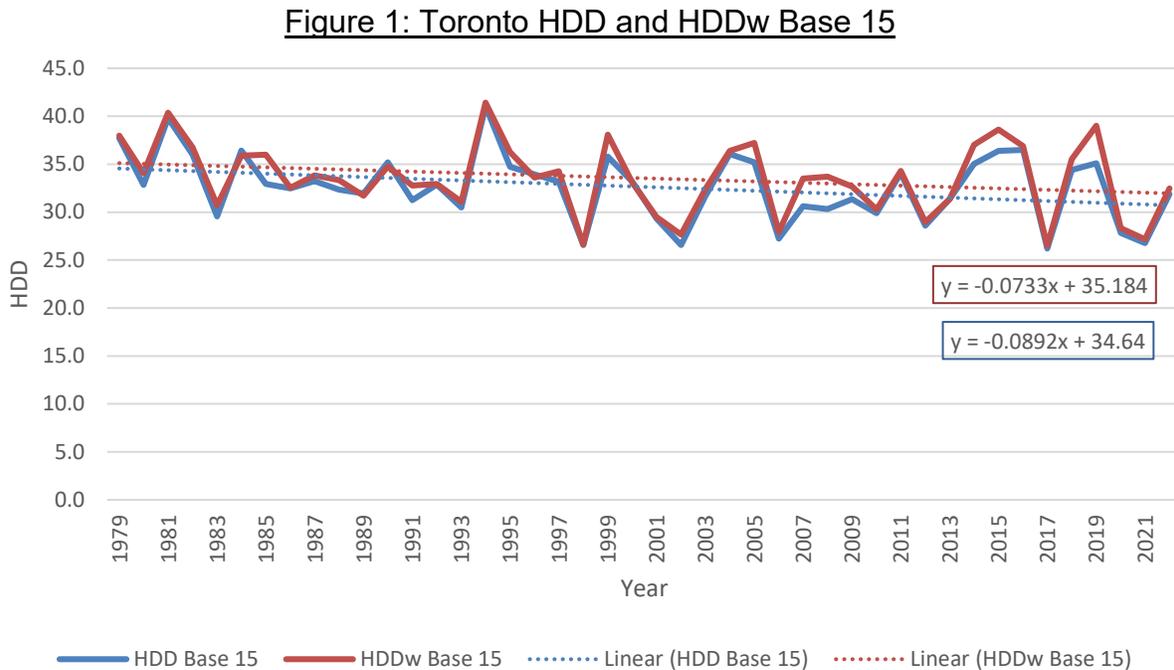

b) Please see Table 1.

Table 1
Coldest Day in Toronto Over Time

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 4, Tab 2, Schedule 3 (Design Criteria)

Question(s):

- a) Does actual peak day demand (PJ/d) ever surpass the system capacity (PJ/d)?
- b) If yes, how is this mitigated in Enbridge's system?

Response:

- a) Yes, it is possible customer demand could exceed the system's capacity. The following are examples of how actual customer demand can exceed the system's capacity, assuming that all operating equipment is available and all required supply, including PDO, is being delivered to Enbridge Gas:
 - If the actual HDDw exceeded the design day HDDw, customer demand will be greater than design day estimates and may exceed the system's capacity.
 - Forecast uncertainty may cause the customer demand to be under-estimated on design day and includes factors such as measurement quality, underestimating customer attachments, underestimating customer growth, and overestimating demand decline due to energy transition.
 - Customer diversification does not materialize as expected leading to higher than anticipated coincident customer peak flows.
 - Interruptible customers' inability to comply with interruption notifications to curtail demand.
- b) For distribution systems across the Company, there is no ability to mitigate a situation where customer demand exceeds the distribution system's capacity after interruptions are called.

In the South rate zone, transmission system capacity is unable to flow additional natural gas from Dawn as the system is assumed to be contracted at capacity after interruptions are called. As such, Enbridge Gas would be unable to move additional

gas through the transmission system to serve this increased customer demand. The only way to meet firm customer demand requirements is to purchase spot gas (not at Dawn, but instead at system extremities) if available. If spot gas is unavailable system demands would exceed system capacity and Enbridge Gas would need to call a force majeure.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 4, Tab 2, Schedule 3, Attachment 1 (Design Criteria – Guidehouse Report)

Question(s):

These questions are for Guidehouse:

- a) Please provide a table indicating when each of the utilities studied most recently updated their design criteria.
- b) Please provide a table listing the date range used for selecting the highest observed HDDw or HDD for each of the utilities studied using the set temperature approach.
- c) Please provide a table listing the HDD and assumed design day temperature that each of the utilities studied would arrive at for Toronto.
- d) What are the design day assumptions in Vermont?

Response:

The following response was provided by Guidehouse Canada Ltd.:

- a) Table 1 provides the publication date of the pertinent planning or regulatory document referred for each the utilities reviewed in this study, thereby reflecting the date for most recent update to the design day criteria.

Table 1

S. No.	Utility Name	Date of most recent update to Design criteria (based on the date of the most recent publication providing the Design Day approach)
1	National Grid - Boston Gas and Narragansett Electric	National Grid, Boston - Nov, 2020 National Grid, Rhode Island - July 2019
2	National Grid – Downstate New York	June 2021
3	Public Service Electric and Gas	April 2021
4	New York State Electric & Gas and Rochester Gas & Electric	July 2020
5	Consolidated Edison New York Inc	July 2020
6	DTE Gas	May 2022
7	CenterPoint Energy Minnesota Gas	July 2018
8	National Fuel Gas Distribution Corporation	July 2020
9	Wisconsin Power and Light	July 2021
10	Northern States Power Company, a Wisconsin Corporation	December 2021
11	EPCOR Natural Gas Limited Partnership	June 2020

b) Table 2 provides available information on the date range used for selecting the highest observed HDDw or HDD for each of the reviewed utilities using the set temperature approach for design day calculation.

Table 2

S. No.	Utility Name	Date range used for selecting highest observed HDD
1	National Grid – Downstate New York	1980 to 2019 (40 years)
2	Public Service Electric and Gas	Not available
3	Consolidated Edison New York Inc	Not available
4	DTE Gas	Peak day design conditions are evaluated on an annual basis. Design Day temperatures are derived by identifying the lowest daily mean temperatures experienced in the last 60 years in each of the sixteen separate regions throughout DTE Gas's service territory.
5	National Fuel Gas Distribution Corporation	Not available
6	Wisconsin Power and Light	Design day conditions are based on the coldest day on record in Wisconsin, which was on February 2, 1996. Hourly weather data from the city of Madison for the 24-hour coldest day period, ending at 9 am, is used to compute gas day weather. Further, the throughput for the peak days of each of the last five years of historical data are weather adjusted with coefficients from the Design Day regression model.
7	Northern States Power Company, a Wisconsin Corporation	The Design Day temperature, which is -27 Fahrenheit and 92 HDD, is based on the coldest day on record, which was February 2, 1996.

- c) This calculation was not covered in the scope of the Design Day Study. This type of analysis would be complex and require detailed research of comparator utilities' design day criteria and methodologies.
- d) Vermont Gas Systems (VGS) was not one of the utilities reviewed under the Design Day study. VGS serves a customer base of approximately 55,000 customers across 3 counties¹, vastly different from Enbridge Gas that serves over 3.8 million residential, commercial, and industrial customers across more than 300 municipalities and more than 20 First Nations. According to the comparator utility selection criteria included in the Guidehouse report², VGS did not qualify to be included as a comparable utility to Enbridge Gas for design day comparison purposes.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 4, Tab 2, Schedule 6 (Hydrogen) & Exhibit 2, Tab 6, Schedule 2, Appendix A, page 28

Preamble:

These questions relate to the document entitled *Hydrogen Strategy for Canada, Seizing the Opportunities for Hydrogen, A Call to Action*, December, 2020.

Question(s):

- a) Was the *Hydrogen Strategy for Canada, Seizing the Opportunities for Hydrogen, A Call to Action*, December, 2020 approved by Cabinet or Parliament? If yes, when and in what instrument?
- b) Enbridge states that the Government of Canada has a national strategic vision involving a move to 100% dedicated hydrogen through “new dedicated hydrogen pipelines”. This is cited to page 20 of the *Hydrogen Strategy for Canada*. Please provide the full except of the text that Enbridge is relying on. It is not clear from a review of the document itself.
- c) Please confirm that the *Hydrogen Strategy for Canada, Seizing the Opportunities for Hydrogen, A Call to Action*, December, 2020 does not:
 - i. Compare the cost of decarbonization with and without dedicated hydrogen pipelines;
 - ii. Commit the Government of Canada to a decarbonization pathway that is consistent with the “vision” set out in the document.

Response:

- a) Enbridge Gas is unable to confirm if *Hydrogen Strategy for Canada* was approved by Cabinet of Parliament. However, it is clear from the Foreword to the *Hydrogen Strategy*, written by the Honourable Seamus O’Regan Canada’s Minister of Natural Resources, that the Strategy is endorsed by the Canadian Government.

- b) The Hydrogen Strategy for Canada lays out Canada's strategy for hydrogen deployment, and on multiple occasions throughout the document mentions the need or potential for 100% dedicated hydrogen pipelines. Note that the reference to page 20 of this report is the PDF page number, which corresponds to Executive Summary page XVIII. This reference, plus several others, are listed below:

Due to possible technical constraints, beyond blending limits of ~20% by volume, dedicated hydrogen pipelines start to become an attractive alternative. In a net-zero future where distributed combustion emissions need to be largely eliminated, hydrogen may become the new chemical fuel of choice for heating in Canada, and utilities will play an important leadership role in that transition.¹

If Canada seizes the opportunities for hydrogen, by 2050 the country could realize the following: ... >50% of energy supplied today by natural gas is supplied by hydrogen through blending in existing pipelines and new dedicated hydrogen pipelines.²

Canada's extensive network of natural gas transmission and distribution pipelines could act as large-scale energy storage and distribution networks for hydrogen, carrying either a blend of hydrogen and natural gas or pure hydrogen over the long term.³

Where pure hydrogen is required, dedicated hydrogen pipeline systems may become an attractive option for low-cost transportation of hydrogen at scale⁴

Similar to the US, a backbone network of hydrogen pipelines could be a strategic infrastructure asset for Canada. This backbone would be fundamental to facilitating trade and cooperation across provinces. Once the infrastructure is in place, this is by far the lowest cost and lowest emissions means of bulk transportation.⁵

[Hydrogen can be] fed into dedicated hydrogen pipelines and used as a high-value transportation fuel or used as an industrial feedstock.⁶

¹ Hydrogen Strategy for Canada, Seizing the Opportunities for Hydrogen, A Call to Action, December, 2020, pp.XIV-XV, https://natural-resources.canada.ca/sites/nrcan/files/environment/hydrogen/NRCan_Hydrogen-Strategy-Canada-na-en-v3.pdf

² Ibid, pp.XVII-XVIII.

³ Ibid, p.5.

⁴ Ibid, p.41.

⁵ Ibid, p.42.

⁶ Hydrogen Strategy for Canada, Seizing the Opportunities for Hydrogen, A Call to Action, December, 2020, p.58, https://natural-resources.canada.ca/sites/nrcan/files/environment/hydrogen/NRCan_Hydrogen-Strategy-Canada-na-en-v3.pdf

Hydrogen blending limits can be overcome by localizing portions of the natural gas infrastructure or end customers who can tolerate higher hydrogen concentrations, with the potential to have 100% dedicated pipelines in some regions of Canada.⁷

Over time, as domestic production and demand grow, there will be a need for dedicated infrastructure such as hydrogen pipelines and liquefaction plants. Ensuring that these crucial assets can be built, in a coordinated and timely manner, will be essential to ensuring low cost, low CI hydrogen can be delivered to both domestic and international markets.⁸

As the percent of hydrogen in NG systems increases, dedicated hydrogen pipelines will become an attractive alternative.⁹

- c)
- i. It does not appear that the Hydrogen Strategy for Canada document includes costing information at a level of detail that compares the cost of decarbonization with and without dedicated hydrogen pipelines.
 - ii. Enbridge Gas views the document for what it is, a strategy for hydrogen which defines how Canada plans to deploy its hydrogen ambitions. On its face, the Strategy does not “commit” the Government of Canada to a specific decarbonization pathway.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 4, Tab 2, Schedule 6 (Hydrogen) & Exhibit 2, Tab 6, Schedule 2, Appendix A, page 28

Question(s):

- a) On page 6, Enbridge states: “blending 20% hydrogen into the entire natural gas grid (subject to a full system feasibility study) could yield approximately 2.3 million tonnes of carbon dioxide equivalent (tCO₂e) of GHG emissions reduction.” Please provide:
- i. An approximate best estimate of the incremental annual commodity cost of blending 20% hydrogen into the entire natural gas grid based on (A) the current cost of fossil-fuel derived hydrogen without CCS (grey hydrogen), (B) an estimated cost of blue hydrogen, and (C) an estimated cost of green hydrogen;
 - ii. An approximate best estimate of the incremental transmission and distribution costs of blending 20% hydrogen into the entire natural gas grid, both (A) total and (B) on an annualized basis;
 - iii. An approximate best estimate of the \$/tCO₂e for blending 20% hydrogen into the entire natural gas grid based on (A) grey hydrogen, (B) blue hydrogen, and (C) green hydrogen.

For the above, please provide all underlying assumptions and calculations. Please make and state any simplifying assumptions and caveats as necessary.

- b) On page 6, Enbridge states: “blending 20% hydrogen into the entire natural gas grid (subject to a full system feasibility study) could yield approximately 2.3 million tonnes of carbon dioxide equivalent (tCO₂e) of GHG emissions reduction.” If this were done with blue hydrogen, approximately how many residual emissions (tCO₂e) would be attributable to the hydrogen on an annual basis? Please include all lifecycle emissions, including those from leaks and uncaptured CO₂e. Please either use the CCS and CO₂e emissions assumptions from the following peer-reviewed study or provide a table comparing the Enbridge’s assumptions with the peer-reviewed assumptions, with a justification for the deviation: Robert W. Howarth and Mark Z.

Jackson, "How green is blue hydrogen?" Energy Science & Engineering, 26 July 2021 ([link](#)).

Response:

- a)
- i. The current hydrogen market in Ontario and Canada has not evolved sufficiently to the point where there are reliable, stable market costs or prices for any form of hydrogen. As such, any attempt to identify a commodity cost for this response would be a highly speculative exercise and would introduce risk and uncertainty to any analysis or conclusions that might be made based on that cost. As a result, Enbridge Gas declines to produce the requested cost estimates. Please see response at Exhibit I.1.10-ED-73 part b) iii. for further discussion on hydrogen costs.
 - ii. Enbridge Gas is unable to provide estimates of the incremental transmission and distribution costs of blending 20% hydrogen by volume into the entire gas grid at this time. Enbridge Gas's planned Hydrogen Blending Grid Study (detailed at Exhibit 4, Tab 2, Schedule 6, pages 16 to 18) will help determine the gas grid enhancements and maintenance requirements that may be necessary to support higher hydrogen blends, which can then be evaluated from a cost perspective.
 - iii. For the reasons described in part a) i., Enbridge Gas has declined to provide estimates of hydrogen costs. Without these values, Enbridge Gas is unable to produce an estimate of the cost per tonne CO_{2e} abated by blending 20% hydrogen in the gas grid.
- b) Regardless of the type of hydrogen used to blend 20% hydrogen into the gas grid (subject to full system feasibility), approximately 2.3 million tonnes CO_{2e} of end-use customer emissions would be abated by displacing natural gas use. Enbridge Gas has not performed a lifecycle emissions calculation for blue hydrogen and has no experience in the production of blue hydrogen with CCS. Enbridge Gas has not reviewed the referenced study for applicability to its service territory, its customers or other Enbridge Gas-specific parameters and, therefore, declines to produce the requested calculations.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 4, Tab 2, Schedule 6 (Hydrogen) & Exhibit 2, Tab 6, Schedule 2, Appendix A,
page 28

Question(s):

- a) What does blending 20% by volume of hydrogen into methane gas equate to in terms of a percent by energy content (%)?
- b) Enbridge states: "Based on current knowledge, Enbridge Gas's systems may require substantial changes above 20% hydrogen by volume." Please itemize each component (e.g. kinds of pipes, connectors, compressors, etc.) that may require substantive changes above 20% hydrogen by volume. For each component, please list how many there are in Enbridge's system (by km if it is a kind of pipe).

Response:

- a) Hydrogen has an energy content by volume of about 1/3 of the energy content of natural gas. Blending 20% by volume hydrogen results in a blended gas with approximately 86% of the energy content per volume compared with natural gas.
- b) Enbridge Gas is planning a Hydrogen Blending Grid Study to better understand the impacts of blending hydrogen into our pipeline system. The scope of the study will consider all of Enbridge Gas's existing gas transmission and distribution assets in Ontario, including:
 - 78 214 km of gas distribution main lines
 - 66 787 km of gas distribution service lines
 - 5 471 km of gas transmission lines
 - associated fittings and equipment

Please see the Hydrogen Blending Grid Study provided at Exhibit 4, Tab 2, Schedule 6, pages 16-18 for more details on this initiative.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 4, Tab 2, Schedule 6 (Hydrogen) & Exhibit 2, Tab 6, Schedule 2, Appendix A,
page 28

Preamble:

Enbridge states on page 10: "Moreover, because hydrogen has lower volumetric energy density compared to natural gas, existing networks will need additional capacity from pipe reinforcement, station replacements or other upgrades to account for the increased volume of hydrogen that will be required to meet energy demand from customers."

Question(s):

- a) How many m³s of hydrogen have the same energy content of 1 m³ of methane?
- b) How much pipeline capacity (m³/day) carrying 100% hydrogen is required for the same energy content of 1 m³/day of capacity of a pipe carrying methane only?
- c) How much pipeline capacity (m³/hour) carrying 100% hydrogen is required for the same energy content of 1 m³/hour of capacity of a pipe carrying methane only?
- d) How much pipeline capacity (m³/day) carrying a 20%/80% hydrogen/methane mix is required for the same energy content of 1 m³/day of capacity of a pipe carrying methane only?
- e) How much pipeline capacity (m³/hour) carrying a 20%/80% hydrogen/methane mix is required for the same energy content of 1 m³/hour of capacity of a pipe carrying methane only?

Response:

- a) The heating values for pure hydrogen and pure methane are approximately 12.7 MJ/m³ and 39.8 MJ/m³ respectively; thus, 3.1 m³ of hydrogen is roughly equivalent in energy content to 1 m³ of methane.

b-e) Not accounting for a reduction of natural gas demand due to energy efficiency or fuel-switching, in order to deliver the same quantity of energy, a pipeline carrying 100% hydrogen or a blend of hydrogen and natural gas will require more pipeline capacity than a pipeline carrying 100% methane. Though hydrogen has approximately one third the volumetric energy compared to methane, it does not directly result in requiring three times the pipeline capacity to deliver the same amount of energy.

Determining differences in pipeline capacities between methane, hydrogen, or blends is dependent on unique system parameters such as, but not limited to, pipe characteristics and length, operating conditions and requirements, locations of system constraints, and proximity to hydrogen injection and end-use. Engineering assessments can be used to identify the means to deliver hydrogen, RNG or blends thereof and recommend any modifications of existing or development of new pipelines as required.

Note, however, that energy transition is not going to occur overnight, and the need to modify or enhance pipe and pipeline systems won't happen for the entire system at once, or in isolation of other influences. Other energy transition impacts (energy efficiency, fuel switching, electrification, appliance technology evolution, etc.) will be occurring in parallel and these impacts will influence the rate and magnitude of change that may ultimately be required for the distribution system. Additionally, the ability to isolate sections of the current gas grid is a feature that can be leveraged to safely and reliably introduce other low-carbon fuels more gradually (as Enbridge Gas is currently doing with the Low-Carbon Energy Project¹). Energy transition will be an evolution involving many factors and, therefore, predicting changes required to pipe in isolation is insufficient.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 4, Tab 2, Schedule 6 (Hydrogen) & Exhibit 2, Tab 6, Schedule 2

Question(s):

- a) Per page 13, the LCEP phase 1 is “yielding GHG emissions abatement as predicted.” Please provide:
 - i. The annual tCO₂e being saved on average;
 - ii. The incremental distribution costs (annualized);
 - iii. The \$/tCO₂e accounting only for the incremental distribution costs;
 - iv. The \$/tCO₂e accounting for the incremental distribution costs and a commodity cost equal to the difference between the cost of methane and the cost of (A) grey hydrogen currently available and (B) the cost of blue hydrogen [please use these estimated costs as we understand that the hydrogen in this project is coming at no incremental costs through a special arrangement that would not be available through a scaled-up project].
- b) Please provide the figures from (a) for LCEP stage 2.
- c) Enbridge states at page 15: “Costs associated with the implementation of the LCEP phase 2 are estimated at \$7 million and are included in Enbridge Gas’s Asset Management Plan, provided at Exhibit 2, Tab 6, Schedule 2.” Please provide the page numbers from the AMP for the figures that this project is included under. Please provide a breakdown of these forecast costs by year.

Response:

- a) For LCEP Phase 1:
 - i. The year 2022 is the first full year for which GHG emissions savings can be calculated. The emissions savings from January 1, 2022 to December 31, 2022 are 86 tCO₂e. Yields are expected to be higher in 2023 and beyond as the 2022 numbers were affected by planned blending plant upgrades which took the blending facility out of operations periodically.

ii. The incremental distribution O&M costs¹ for LCEP Phase 1 per customer for the last 3 months of 2021, all of 2022 and the forward looking forecast from 2023 to 2026 are:

- 2021 - \$0.083
- 2022 - \$0.24
- 2023 to 2026 - \$0.50

Please see further discussion on O&M costs for LCEP Phase 1 provided in response at Exhibit I.2.5-VECC-17.

iii. Based on the incremental distribution O&M costs² and emission savings from 2022, the incremental cost of emissions reductions achieved in 2022 is \$10.02/tCO_{2e}. For 2023 to 2026 the forecast cost of emissions savings accounting for incremental O&M distribution costs is expected to be approximately \$16.07/tCO_{2e}.

iv. LCEP Phase 1 utilizes hydrogen from the Markham Energy Storage Facility. Enbridge Gas is not able to produce these calculations because currently there is no established market price for grey or blue hydrogen.

b)

i.-iv. An estimate of emissions savings from LCEP Phase 2 is provided at Exhibit 4, Tab 2, Schedule 6, page 15, paragraph 40. Additional details and analysis of expected costs and emissions from LCEP Phase 2 will be addressed in a future leave to construct proceeding for this project.

c) The LCEP Phase 2 capital cost can be found in the Asset Management Plan at Exhibit 2, Tab 6, Appendix B, page 46. Please note the cost reflected in this reference includes overhead allocations. An annual breakdown of LCEP costs are provided in response at Exhibit I.2.5-VECC-17.

¹ Excluding depreciation.

² Excluding depreciation.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 4, Tab 2, Schedule 6 (Hydrogen) & Exhibit 2, Tab 6, Schedule 2

Question(s):

- a) Please calculate the cost of GHG emissions reductions (\$/CO2e) from hydrogen injection including only the incremental commodity costs of replacing natural gas with hydrogen created via power-to-gas. Please use Enbridge’s estimate of the cost to produce hydrogen by power-to-gas in Ontario. Please provide a table showing the underlying calculations. If the answer differs from what was provided in EB-2019-0294, Exhibit I.ED.11, please explain.
- b) What percent of energy is lost when converting electricity to hydrogen through electrolysis?
- c) Please complete the following table comparing the overall efficiency of using green energy to power heat pumps versus using green energy to generate hydrogen to be burned in a furnace and water heater. We have input initial values – if Enbridge believes different values would be more accurate, please use those and explain the change.

Energy Efficiency Comparison Between Hydrogen Combustion vs. Electric Heat Pumps Residential Space and Water Heating

Space Heating		Water Heating	
Gas Furnace	Heat Pump	Gas Heater	Heat Pump
Energy input	1 kWh	1 kWh	1 kWh
Hydrogen conversion loss	25%	n/a	25%
Energy input minus loss ⁶⁸	0.75 kWh	1 kWh	0.75 kWh
Annual heating efficiency	95%	300%	67%
Heat output ⁶⁹	0.7 kWh	3 kWh	0.5 kWh
Output difference ⁷⁰	430%		750%

Response:

- a) There is no change in Enbridge Gas's estimate from the response provided in EB-2019-0294, Exhibit I.ED.11.
- b) Enbridge Gas can only comment on publicly available manufacturer data and its own first-generation unit to give an indication of energy losses when converting electricity to hydrogen through electrolysis.

Based on the three manufacturers shown below, losses at the higher heatingvalue (HHV) are around 17% to 21%, and 31% to 33% at the lower heating value (LHV).¹ Efficiency of electrolyzers is usually provided by manufacturers in the units of energy required to make a unit of hydrogen as shown in the high and low heating values. Losses are calculated as 100% minus the efficiency rate.

To demonstrate the diversity in technologies and the range between manufacturers, the following is offered on electrolyzer efficiencies from three prominent manufacturers:

- i. Canada: Cummins Inc's. HyLYZER 500 Spec Sheet shows a power stack consumption of 40 to 48 [kWh/kg] translating to a range of: 98.5% to 82.1% efficiency at the HHV, and 83.3% to 69% at the LHV.²
- ii. Europe: Nel shows average stack consumption of 4.5 kWh/Nm³, translating to: 79% and 67% respectively at the high and low heating values.³
- iii. US: Plug Power shows average stack efficiency at 49.9 kWh/kg, translating to: 79% and 69% respectively at the high and low heating values.⁴

Enbridge Gas uses Cummins first generation electrolyzers with an average approximate efficiency of 51.2 kWh/kg or ~77% efficiency, or ~23% losses.

Enbridge Gas also points out that the industry is experiencing a rapid pace of growth and development as evidenced by recent announcements from Hysata in Australia and Bloom Energy and the Idaho National Labs in the US.

¹ To be conservative, these ranges exclude the anomalous high-end efficiency of 98.5% at HHV and 83.3% at LHV for the Cummins product.

² HyLYZER Water Electrolyzers, <https://www.cummins.com/sites/default/files/2021-08/cummins-hylyzer-500-specsheet.pdf>

³ Nel, M Series Containerized. Proton Exchange Membrane (PEM) Hydrogen Generation Systems, <https://nelhydrogen.com/wp-content/uploads/2022/06/M-Series-Containerized-Spec-Sheet-Rev-E.pdf>

⁴ Plus EX-425D Electrolyzer, <https://resources.plugpower.com/electrolyzers/ex-425d-f041122>

Hysata based in Australia recently announced a 41.5kWh/kg unit in their recent press release on March 16, 2022. This efficiency expressed as a percentage translates to 95% or a 5% loss.⁵

Bloom Energy and the Idaho National Labs in the US have also announced breakthroughs for their hydrogen solid oxide electrolyzer attaining 37.7kWh/kg or 88.5% LHV.⁶

- c) Enbridge Gas does not agree that this comparison of technologies is appropriate. Enbridge Gas is not aware of how the figures in the tables were arrived at and is not able to verify their accuracy. The use of hydrogen in gas furnaces is still evolving, so comparing the use of hydrogen in a furnace with a fully developed technology such as an electric heat pump is not a fair comparison.

⁵ Hysata. (2022, March 16). Hysata's electrolyser breaks efficiency records. News. <http://hysata.com/news/hysatas-electrolyser-breaks-efficiency-records-enabling-world-beating-green-hydrogen-cost/>

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 4, Tab 2, Schedule 6 (Hydrogen) & Exhibit 2, Tab 6, Schedule 2, Appendix A,
page 28

Question(s):

- a) Will the Hydrogen Blending Grid Study involve any testing of actual hydrogen blending in customer equipment aside from the LCEP phases 1 and 2? If yes, please provide details.
- b) Please justify treating this as a capital expenditure.

Response:

- a) There are no plans to test customer equipment in the Hydrogen Blending Grid Study.
- b) Please see response at Exhibit I.2.6-PP-37 part b).

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 4, Tab 2, Schedule 6 (Hydrogen) & Exhibit 2, Tab 6

Question(s):

- a) Please provide a best estimate of the cost at which hydrogen can currently be produced in Ontario (per m³ and GJ) via power-to-gas. Please include and separately itemize the cost of electricity and the cost of converting electricity to hydrogen. Please make all assumptions as necessary and state all assumptions.
- b) If technological advancements are expected, please provide a best estimate of the cost at which hydrogen could be produced in Ontario in 2030 (per m³ and GJ) via power to gas. Please include and separately itemize the cost of electricity and the cost of converting electricity to hydrogen. Please discuss and provide a qualitative answer if a quantitative one is not possible.
- c) What is the going market rate for hydrogen in Ontario (per m³ and GJ)? If a single rate cannot be provided, please provide a range and some examples.
- d) What is the going market rate for hydrogen in Ontario (per m³ and GJ) created from power-to-gas? If a single rate cannot be provided, please provide a range and some examples.
- e) What is the going market rate for hydrogen in California (CAD per m³ and GJ)? If a single rate cannot be provided, please provide a range and some examples.
- f) What is the going market rate for hydrogen in California (CAD per m³ and GJ) created from power to gas? If a single rate cannot be provided, please provide a range and some examples.
- g) What is Shell Canada charging for hydrogen in its hydrogen refuelling stations in Quebec? An average, approximate, or point-in-time answer is sufficient. Would this hydrogen be mostly from natural gas reforming or power to gas?
- h) What is the percentage difference between the current cost for hydrogen and natural gas in Ontario of the same heating value (for hydrogen created via power to gas)

Please provide the forecast difference between now and 2040, both annual and average over that period? Please provide the underlying calculations.

- i) For each of the above, if Enbridge provides a different answer from the answer provided in EB-2019-0294, Exhibit I.ED.6, please explain.

Response:

- a-i) The hydrogen market in Ontario and North America has not evolved sufficiently since the response provided at Exhibit I.ED.6 in Enbridge Gas's Application for leave to construct natural gas pipelines and associated facilities in the City of Markham, Regional Municipality of York,¹ for Enbridge Gas to provide updated or different responses to these questions at this time.

¹ EB-2019-0294.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 4, Tab 2, Schedule 7

Preamble:

These questions relate to Phase 1 issues, including whether Enbridge has appropriately considered energy transition issues in relation to the capital spending it seeks, such as whether Enbridge has overstated the ability of low carbon fuels to maintain the usefulness of pipelines in a decarbonized future.

Question(s):

- a) Please provide a table comparing the quantity of RNG that would be procured under its proposed low-carbon energy purchases with the amounts in the diversified scenario in the Guidehouse pathways report. Please provide the comparison both on an annual basis and on a trajectory basis (i.e. if the increase in purchases would occur at a trajectory that would be consistent with the diversified scenario).
- b) What total annual funding and total annual RNG (m³) corresponds to the maximum \$2 per residential customers?
- c) Footnote 4 on page 5 lists 0.001958 tCO₂e/cubic meter. Enbridge has previously used 0.001874 tCO₂e/cubic meter. Please explain the different sources for these figures and explain which is the correct figure to be used throughout the application. What figure is used by the Guidehouse pathways report?
- d) What is the average price that Enbridge expects to pay for RNG if it is able to procure long term contracts as it proposes?
- e) If Enbridge is able to procure RNG as proposed, what does it anticipate the cost of emissions reductions to be(\$/tCO₂e) including (i) only the community cost difference and (ii) the commodity cost difference and other incremental administrative costs.
- f) How do the responses to (d) and (e) compare to the RNG assumptions in the Guidehouse pathways report?

- g) Please estimate the carbon footprint of a m³ of RNG associated with RNG methane leakage from the distribution system and customer equipment. Assume for the purposes of this question that the feedstock would have entered the atmosphere as CO₂e not unburned methane (e.g. landfill flaring).

Response:

- a-b, d- f) The issues will be addressed in Phase 2 of the proceeding in accordance with the OEB's Decision on Issues List dated January 27, 2023.
- c) The emission factor 0.001958 tCO₂e/m³ of natural gas is derived from the federal carbon pollution pricing charge \$0.0979/m³ and the carbon price of \$50/tCO₂e for the year 2022. This is the most appropriate value to use when calculating the federal carbon charge savings associated with using RNG under the Greenhouse Gas Pollution Pricing Act.

The emission factor 0.001874 tCO₂e/m³ of natural gas was derived from the Guideline for Quantification, Reporting and Verification of Greenhouse Gas Emissions¹ for natural gas distribution in Ontario. This factor was used to calculate Enbridge Gas's scope 3 GHG emissions up to 2021. This was the most recent factor provided for determining natural gas distribution customer GHG emissions by the Ontario government. Starting with the 2022 reporting year, Enbridge Gas has updated the emission factor used for end-user customer combustion of natural gas and savings from displacement of natural gas to the factors in the National Inventory Report for Ontario, which is 0.001932 tCO₂e/m³.²

The following response was provided by Guidehouse:

The emission factor for natural gas that was used in the Guidehouse pathways report was equivalent to 0.001876 tCO₂e/m³.³ Guidehouse divided "GHG Emissions by Energy Source (MTCO₂e)" by "Energy Use by Energy Source (PJ)" to get 0.0483 MTCO₂e/PJ, which was then converted to units of tCO₂e/m³. Guidehouse also accounted for the CH₄ and N₂O emissions of RNG combustion using the emission factor 0.0113 kgCO₂e/m³ from the National Inventory Report.⁴

¹ Ontario Ministry of the Environment and Climate Change. (2017, November). Guideline for Quantification, Reporting and Verification of Greenhouse Gas Emissions. Table 20-3 and Table 20-4. https://prod-environmental-registry.s3.amazonaws.com/2018-01/013-1457_d_Guide.pdf.

² Environment and Climate Change Canada. (2022, April 14). 2022 National Inventory Report 1990-2020: Greenhouse Gas Sources and Sinks in Canada. Part 2. Table A6.1-1 and Table A6.1-3. <https://unfccc.int/documents/461919>

³ NRCan National Energy Use Database, 2019 Version.

⁴ Environment and Climate Change Canada. (2022, April 14). 2022 National Inventory Report 1990-2020: Greenhouse Gas Sources and Sinks in Canada. Part 2. Table A6.1-3.

g) Please see response at Exhibit I.4.3-ED-133 part d) for the leakage % and Exhibit I.4.3-ED-133 part g) for the equivalent emissions for 1 m³ of RNG released to the atmosphere. Using the 5-year average for UFG, the carbon footprint associated with RNG methane leakage from the Enbridge Gas system (up to and including the customer meters) is 0.00000823 tCO_{2e}/m³.

Enbridge Gas considers that the benefits in the recovery of landfill gas that would otherwise be flared and unutilized (or be released to the atmosphere where no landfill gas collection system is in place), and its upgrading into RNG that displaces fossil natural gas, more than offset the costs of the negligible amounts of leakage that may occur during its transportation through the gas system.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Energy Probe Research Foundation (EP)

Interrogatory

Reference:

Exhibit 4, Tab 2, Schedule 2, Table 2, Page 11, *Reference Price*

Preamble:

“Customers in the Northwest zone will see an increase of \$0.691 /GJ or \$27 /10³m³. Customers in the EGD zone will see a decrease of \$0.603/GJ or \$33.641/10³ m³.”

Question(s):

What are the impacts for a customer at the average use and high use consumption?

Response:

Please see Attachment 1 for the gas supply commodity charge bill impacts resulting from the harmonized reference price proposal for typical customers in the EGD and Union North West rate zones.

The EGD PGVA reference price of \$231.041/10³m³ provided at Exhibit 4, Tab 2, Schedule 2, Table 2, line 2 includes transportation and load balancing costs to move gas to the Enbridge CDA and the Enbridge EDA, and is not directly comparable with the proposed weighted average reference price. Customers in the EGD rate zone who purchase their natural gas from Enbridge Gas will see an increase in their gas supply commodity charge from \$181.367/10³m³ (Western Canada price at Empress) to \$207.493/10³m³ (proposed weighted average reference price), which contributes between 4.8% and 6.8% to the total bill impacts for typical general service customers.

Customers in the Union North West rate zone who purchase their natural gas from Enbridge Gas will see an increase in their gas supply commodity charge from \$180.656/10³m³ (Alberta Border Reference Price) to \$207.493/10³m³ (proposed weighted average reference price), which contributes between 4.6% and 6.4% to the total bill impacts for typical general service customers.

The higher gas supply commodity charges for the EGD and Union North West rate zones are partially offset by lower transportation charges. As such, the impact of one proposal, such as the increase in the reference price for certain rate zones, should not be viewed in isolation. Total bill impacts including all proposals from the Application are provided at Exhibit 8, Tab 2, Schedule 8, Attachment 10, updated March 8, 2023.

Gas Supply Commodity Charge Bill Impact of Harmonized Reference Price

Line No.	Particulars	2023 Reference Price (cents/m ³) (1) (a)	2024 Reference Price (cents/m ³) (2) (b)	Billing Units (m ³) (c)	Total Bill Impact (\$) (d) = (b-a)*(c)/100	2023 Total Bill (\$ (3) (e)	Bill Impact (%) (f) = (d / e)

1	2016/2017	1.9	-	1.9	0.2	2.1
2	2017/2018	1.9	-	1.9	0.6	2.4
3	2018/2019	1.9	-	1.9	0.5	2.4
4	2019/2020	1.9	-	1.9	0.4	2.3
5	2020/2021	1.9	-	1.9	0.5	2.4
6	2021/2022	1.9	-	1.9	0.7	2.6
7	2022/2023	1.9	-	1.9	0.7	2.6
8	2023/2024	1.9	-	1.9	0.7	2.6

Table 2
Derivation of Total Maximum Utility Storage Capacity - EGD Rate Zones

Line No.	Particulars (PJ/d)	Total (a)	Utility (b)	Non-Utility (c)
1	<u>One-Time Separation of Plant Storage Allocation Factor (1)</u>		100.0%	0.0%
	<u>Withdrawals/Dehydration Capacity</u>			
2	Total Shared Capacity	1.9	1.9	-
3	Direct Investment	0.7	-	0.7
4	Total Maximum Withdrawal Capacity (3)	2.6	1.9	0.7
	<u>Injection Capacity</u>			
5	Total Shared Capacity (2)	0.8	0.8	-
6	Direct Investment	0.2	-	0.2
7	Total Maximum Injection Capacity	1.1	0.8	0.2

Notes:

- (1) As of EB-2005-0551 there was no non-utility business.
- (2) Allocated in proportion to line 1.
- (3) Based on design day capacity for Feb 28, 2024.

b) The EGD rate zone utilized 100% of their utility storage space of 99.4 PJ. Table 3 shows how much utility storage space was utilized by the Union rate zones.

Table 3
Storage Space – Union Rate Zones

Line No.	Particulars (PJ)	2016 (a)	2017 (b)	2018 (c)	2019 (d)	2020 (e)	2021 (f)	2022 (g)
1	Storage Space Reserved for Utility	100.0	100.0	100.0	100.0	100.0	100.0	100.0
2	Utility Space Requirement	93.6	93.2	92.4	97.1	97.7	97.0	96.5
3	Excess Utility Storage Space	6.4	6.8	7.6	2.9	2.3	3.0	3.5

- c) EGD did not purchase any Union regulated storage in any year.
- d) Enbridge Gas has never purchased market-based storage for the Union rate zones. Market-based storage purchases for the EGD rate zone for storage years¹ 2016/2017 to 2022/2023 and forecasted market-based storage purchases for 2023/2024 and 2024/2025 are summarized in Table 4. Forecasted storage for 2024/2025 does not include the incremental 10 PJ proposed by Enbridge Gas in Exhibit 4, Tab 2, Schedule 1.

Table 4
Market-Based Storage – EGD Rate Zone

Line No.	Storage Year	Market-based Storage (PJ)
1	2016/2017	24.5
2	2017/2018	24.4
3	2018/2019	26.4
4	2019/2020	26.4
5	2020/2021	26.5
6	2021/2022	26.2
7	2022/2023	26.1
8	2023/2024 ²	26.0
9	2024/2025 ³	18.0

¹ A storage year is considered to be April 1 to March 31.

² See Exhibit 4, Tab 2, Schedule 1, p.19, Table 4 for forecasted market-based storage volumes in 2023/2024 and 2024/2025.

³ Ibid.

- e) The historic average cost of market-based storage purchased for the EGD rate zone for gas years 2016/2017 to 2021/2022 is summarized in Table 5.

Table 5
Average Cost of Market-Based Storage – EGD Rate Zone

Line No.	Storage Year	Average cost (\$/GJ/Yr) ⁴	
1	2016/2017	\$ 0.69	/u
2	2017/2018	\$ 0.74	
3	2018/2019	\$ 0.81	
4	2019/2020	\$ 0.81	
5	2020/2021	\$ 0.83	
6	2021/2022	\$ 0.80	

- f) Please see Table 6 for the historic amount and average cost of storage purchased from non-utility storage, affiliates and from non-affiliates from gas year 2016/2017 to 2021/2022 is summarized.

Table 6
Storage Purchased from Affiliates and Non-Affiliates

Line No.	Storage Year	Amount of Storage Purchased from former Union/EGI non-Utility (PJ) (a)	Average Cost of Storage purchased from former Union/EGI non-Utility (\$/GJ/yr) (b)	Amount of Storage Purchased from Affiliates (PJ) (c)	Average Cost of Storage purchased from Affiliates (\$/GJ/yr) (d)	Amount of Storage Purchased from non-Affiliates (PJ) (e)	Average Cost of Storage purchased from non-Affiliates (\$/GJ/yr) (f)	
1	2016/2017	16.6	\$0.67	-	N/A	7.9	\$0.74	/u
2	2017/2018	16.5	\$0.73	-	N/A	7.9	\$0.75	
3	2018/2019	19.5	\$0.75	-	N/A	6.9	\$0.54	
4	2019/2020	18.5	\$0.84	1.6	\$0.72	6.3	\$0.76	
5	2020/2021	17.5	\$0.89	5.8	\$0.63	3.2	\$0.93	
6	2021/2022	17.5	\$0.86	4.1	\$0.70	4.6	\$0.79	

⁴ Storage costs include demand and commodity charges.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Energy Probe Research Foundation (EP)

Interrogatory

Reference:

Exhibit 4, Tab 2, Schedule 5, Page 5, Paragraph 9

Preamble:

“Since NGEIR, the Company has made significant capital investment to increase non-utility withdrawal capacity at Dawn by 1.0 PJ/d and injection capacity of 0.6PJ/d with all associated costs allocated to the non-utility business.”

Question(s):

- a) For existing storage pools (e.g. Tecumseh) used for the in-franchise storage, how much additional capacity, deliverability and injection capability was added from 2016-2022.for:
 - i. the regulated business; and
 - ii. the Non-regulated business.
- b) What was the average capital cost per PJ for each?
- c) Please provide the annual amounts and average costs for
 - i. Union utility storage sold to EGD rate zone 2016-2022,
 - ii. Non-utility storage sold to EGD rate zone 2016-2022.

Response:

- a)
 - i. There have not been any projects completed to add additional storage capacity, deliverability or injectivity from 2016 to 2022 for the utility business.
 - ii. Please see response at Exhibit I.4.2-FRPO-145 for a list of projects completed to create deliverability and injectivity for the non-utility business. Please see response at I.4.3-FRPO-149 for a list of projects completed to create additional storage capacity for the non-utility business.

- b) Enbridge Gas will not provide cost information for non-utility projects as this information is not relevant to the determination of the regulated utility's gas costs, and is confidential and market sensitive as part of the competitive landscape for natural gas storage in North America.
- c) Please see response at Exhibit I.4.2-EP-60 parts c-e).

ENBRIDGE GAS INC.
Answer to Interrogatory from
Energy Probe Research Foundation (EP)

Interrogatory

Reference:

Exhibit 4, Tab 2, Schedule 6, Page 11, *Hydrogen*

Preamble:

EP wishes to understand the timelines and costs of EGI H2 program during the 2024-2028 rebasing period, as well as technical constraints.

Question(s):

- a) Please provide more details on the proposed program including program elements, projects, timelines, and costs.
- b) Please indicate partners in the program, including Enbridge Inc.
- c) Are there standards related to metallurgical hydrogen embrittlement related to steel components in pipelines and gas appliances? If so, please provide a copy of these.
- d) Please provide a summary of these requirements and the associated maximum hydrogen concentration limits.
- e) What will EGI do to ensure these limits are not exceeded in the proposed blending program- Detailed response requested.

Response:

As provided at Exhibit 4, Tab 2, Schedule 6, Enbridge Gas plans to undertake an evaluation of the Company's natural gas grid in Ontario ("Grid Study") to evaluate major aspects of the natural gas grid system's readiness to accept higher amounts of hydrogen to achieve maximum GHG emission reductions. When EP refers to "the program", Enbridge Gas interprets this to mean the Grid Study and has responded accordingly.

- a) Please see response at Exhibit I.1.10-GEC-6 part c) and Exhibit 2, Tab 6, Schedule 2, Appendix A, page 29.

- b) The scope of the proposed study is limited to assets owned by Enbridge Gas Inc.
- c-d) Enbridge Gas is not aware of any published standard specifically on the topic of the hydrogen embrittlement of steel which is a metallurgical phenomenon. Engineering assessments can help identify the behaviour of hydrogen in steel, which can determine recommendations for integrity management programs, if required, and identify maximum hydrogen limits.
- e) The Grid Study will allow Enbridge Gas to evaluate major aspects of its natural gas grid system's readiness to accept higher amounts of hydrogen to achieve maximum GHG emission reductions, building upon the technical assessment framework already in place. Achieving hydrogen readiness of the natural gas grid involves identifying and implementing the necessary grid enhancements to enable the grid to accept the maximum tolerable amounts of hydrogen while keeping the grid flowing in a safe and reliable manner. Evaluation of impacts on customer end use appliances and technology evaluations that will offer safety systems to ensure maximum hydrogen limits are not exceeded on the pipeline network will be a component of the study. Lessons learned from the ongoing pilots may also be leveraged where possible. It can be expected, therefore, that the Grid Study will take into account any known standards or limits with hydrogen content in pipelines and customer appliances. Enbridge Gas will ensure that the system continues to deliver the energy to its existing gas customers, while ensuring that the necessary engineered safety systems are designed and implemented based on the best available technologies to ensure maximum hydrogen limits are not exceeded, and system reliability and resiliency are maintained. More details about the Grid Study are provided at Exhibit 4, Tab 2, Schedule 6, paragraphs 42 to 49.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 1, pg. 7-8

Preamble:

EGL evidence states: *The final step in the planning process is the execution of the Gas Supply Plan which includes the evaluation of transportation, supply, and storage options. This evaluation must have a long-term strategic focus, taking into consideration future growth and asset requirements by analyzing each decision as part of a balanced portfolio which adheres to the guiding principles. Enbridge Gas will execute on its Gas Supply Plan by contracting for any assets required, then implementing a layered approach to procuring supply at various points. Supply purchase decisions are made regularly throughout the year to allow Enbridge Gas to continuously update its supply purchase plan to account for changes in market conditions and customer demands.*

Question(s):

How many months in advance can EGL fix the price on purchases of monthly gas deliveries of gas at Dawn?

- a) What is the source of this limitation? Please provide a specific reference to any Board decision that limits these advanced, fixed-priced purchases either directly or indirectly.
- b) If indirectly, please provide the internal policy document that EGL relies upon to limit the duration of time allowable to fix the price of future deliveries at Dawn.
- c) If not defined in any internal policy document or Board decision, please provide the practice that EGL maintains to limit the maximum duration in which it can fix a natural gas contract for a monthly delivery of gas at Dawn in a future period.
- d) If not clear from above answers, please provide specific rationale for the limitation.

Response:

Enbridge Gas does not purchase gas at fixed prices for terms greater than 3 months in advance of the transaction date.

a-d) EGD was directed by the OEB to cease its risk management program in EB-2006-0034 and subsequently in EB-2007-0606 and EB-2007-0615, the OEB ruled that it will disallow the recovery of the costs associated with the risk management programs of EGD and Union.

Prior to this direction from the OEB, Union considered fixed-price transactions extending beyond three months from the transaction date as physical hedges. These transactions formed a portion of the risk management activities conducted with the goal of managing future natural gas market price volatility for ratepayers. This definition was included within Union's "System Gas Procurement and Risk Management Policy and Procedures", which was filed with the OEB on several occasions, including in the evidence in the EB-2007-0606 proceeding.¹

¹ EB-2007-0606, Exhibit B, Tab 3, Appendix A, p.5.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 1, pg. 7-8

Preamble:

EGL evidence states: *The final step in the planning process is the execution of the Gas Supply Plan which includes the evaluation of transportation, supply, and storage options. This evaluation must have a long-term strategic focus, taking into consideration future growth and asset requirements by analyzing each decision as part of a balanced portfolio which adheres to the guiding principles. Enbridge Gas will execute on its Gas Supply Plan by contracting for any assets required, then implementing a layered approach to procuring supply at various points. Supply purchase decisions are made regularly throughout the year to allow Enbridge Gas to continuously update its supply purchase plan to account for changes in market conditions and customer demands.*

Question(s):

What is the maximum duration ahead of the initiation of a storage contract that EGL will agree to contracting terms for storage services?

- a) What is the maximum term of any storage contract EGL/Union has signed in the last 10 years to support in-franchise deliveries?
- b) Consistent with the above questions on fixing gas purchase contracts, please provide:
 - i. What is the source of this limitation? Please provide a specific reference to any Board decision that limits the timing of this advanced contracting and term of the storage contract either directly or indirectly.
 - ii. If indirectly, please provide the internal policy document that EGL relies upon to limit the duration of time allowable to contract for storage and term of the storage contract.
 - iii. If not defined in any internal policy document or Board decision, please provide the practice that EGL maintains to limit the maximum duration it can enter into a storage contract in advance of the start of said storage contract, as well as the duration of the term of the storage contract.

iv. If not clear from above answers, please provide specific rationale for the limitation.

Response:

There is no limitation to the maximum duration between storage contract agreement date and the initiation of the term. However, Enbridge Gas purchases storage with terms beginning within the next year, after the demand for storage is confirmed within its annual Gas Supply Plan.

a) In the last 10 years, the longest term of any market-based storage that Enbridge Gas has purchased was 5 years.

b)

i-iv. Enbridge Gas seeks to have a storage contract portfolio with diversity in counterparty, term and expiration date. Enbridge Gas has found that most storage providers do not offer services beyond 5 years and has therefore limited the requested terms in its blind request for proposals (RFPs) to 1 to 5 year offerings. This practice has resulted in term diversity in the portfolio of storage held to support the Gas Supply Plan while also providing flexibility to respond to changing market conditions and changes in in-franchise demand for storage.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 1, pg. 7-8

Preamble:

We are interested in understanding the load balancing option to purchase delivered gas at Dawn during the winter period that has its price fixed 9 months or longer ahead of the start of those deliveries. To do this, we are asking for data on the spread between summer (Apr.-Oct.) and winter (Nov.- Mar.) strips of gas as a measure.

Question(s):

For each of the last 5 gas winters, starting with 2018/19 going to 2022/23, using forward market prices at Dawn (providing reference to published source) on the dates provided , complete the following table using 2018/19 as an example:

DATE	APR-OCT PRICE	NOV-MAR PRICE	DIFFERENCE
FEB. 1/18			
NOV. 1/17			
MAY 1/17			
NOV. 1/16			

For clarity, for each year used, please start the provision of data with Feb. 1st of that year and prior dates, 12, 18 and 24 months prior to Nov. 1st.

Response:

Please see the requested information in Table 1. Also, please see response at Exhibit I.4.2-FRPO-100 part e), which addresses the stated interest in the preamble above.

Table 1
Forward Summer & Winter Prices at Dawn (US\$/mmbtu)

Line No.	Date	Apr – Oct (a)	Nov – Mar (b)	Difference (c)

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 1, pg. 8

Preamble:

EGI evidence states: *With OEB approval, beginning in 2024, Enbridge Gas will create and operationalize the Gas Supply Plan as one integrated utility without separate rate zones for EGD, Union North and Union South.*

Question(s):

Does EGI propose to have only one gas supply rate, including commodity and transportation, for the entire EGI franchise?

a) If not, please explain.

b) If so, please provide the transportation rates, on a C\$/GJ basis for:

- i. Empress to Thunder Bay (WDA)
- ii. Empress to Sarnia (SWDA)
- iii. Empress to Toronto (EGD CDA)
- iv. Empress to Ottawa (EGD EDA)
- v. Please confirm that the above transportation rates are expected to remain relatively constant through 2026.

c) How will the variance in the above transportation rates be handled in establishing a single gas supply rate, including transport? Please explain the company's views on the equity of this approach for customers from a historic perspective.

Response:

No, Enbridge Gas is proposing the following three gas supply charges. These charges are applicable to all customers regardless of their location within Enbridge Gas's franchise area.

- 1) Gas supply commodity charge for customers taking sales service;
 - 2) Gas supply transportation charge for customers taking sales service or bundled direct purchase with a Dawn, Parkway, or Enbridge CDA obligated point of receipt; and
 - 3) Gas supply Western transportation charge for bundled direct purchase customers with an Empress obligated point of receipt.
- a) Enbridge Gas is proposing separate gas supply commodity and gas supply transportation charges to recognize that certain TCPL costs are incurred by Enbridge Gas to transport gas from Empress or Dawn for both sales service and bundled direct purchase customers. By including the TCPL costs in the gas supply transportation charge, a separate transportation charge for sales service and bundled direct purchase is not required, as described in part 2).¹
- b) Please see Exhibit 4, Tab 2, Schedule 1, Attachment 3 for a list of upstream transportation contracts and demand charges used in the derivation of gas costs for the 2024 Test Year Forecast. The unitized demand charge for the requested paths are:
- i. Empress to WDA: \$0.58 C\$/GJ.
 - ii. Enbridge Gas does not contract for TCPL Empress to SWDA capacity.
 - iii. Empress to Enbridge CDA: \$1.255 C\$/GJ (Enbridge Gas does not contract for TCPL FT service on this path. The calculated demand charge consists of the LTFP service tolls for the small capacity held by Enbridge Gas to the Enbridge CDA: Empress to North Bay Junction LTFP toll of \$0.93 C\$/GJ plus the North Bay Junction to Enbridge CDA toll of \$0.325 C\$/GJ).
 - iv. Empress to Enbridge EDA: \$1.347 C\$/GJ.
 - v. Not confirmed. Demand charges on the TCPL Western Mainline have been fixed under the 2021-2026 Mainline Settlement Application. However, an earnings sharing mechanism exists whereby certain triggers can result in disposition of TCPL's Short-term Adjustment Accounts, which are passed on to customers in the form of rate riders on each applicable transportation path. Rate riders have been triggered and implemented effective January 1, 2023 and may be updated each year under the Mainline Settlement Application term. These rate riders do not impact LTFP contracted paths.

¹ Enbridge Gas is proposing a gas supply Western transportation charge for bundled direct purchase customers with an Empress obligated point of receipt.

c) As noted earlier in the response, Enbridge Gas is not proposing a gas supply rate that includes transportation. Enbridge Gas has a diverse gas supply portfolio, which includes gas supply from Empress and other locations, such as Dawn (or locations upstream of Dawn). As such, the tolls provided in part b) do not represent the transportation costs to provide service to these locations.

Enbridge Gas has prepared a summary of the gas supply arrangements to meet average day demands for the current rate zones and the proposed service areas² to illustrate the gas supply diversity, which is provided at Exhibit 8, Tab 2, Schedule 1, Table 2. A copy of this table is provided below.

Table 1
Estimate of Gas Supply Transportation on Average Day

Line No.	Rate Zones / Service Areas	Western Canada (1) (a)	Other Supply (1) (2) (b)
	<u>Current Rate Zones</u>		
1	EGD Rate Zone	15%	85%
2	Union North West Rate Zone	100%	0%
3	Union North East Rate Zone	5%	95%
4	Union South Rate Zone	0%	100%
	<u>Service Areas</u>		
5	Central	0%	100%
6	North	45%	55%
7	East	80%	20%
8	South	0%	100%

Notes:

- (1) Gas supply at Empress and transported on the TransCanada Mainline to meet average day.
- (2) All other gas supply arrangements to meet average day.

Enbridge Gas has proposed that customers pay an average system-wide or uniform rate for transportation regardless of location, without recognition of variances in transportation tolls. This proposal ensures no one customer has an advantage over others based on their location within the province. By setting common rates based on average costs, there is additional rate stability for customers over time.

² The service areas are geographic regions with similar operating characteristics. A description of the service areas and the gas supply arrangements are described at Exhibit 8, Tab 2, Schedule 1, Section 1.3.

From a historic perspective, Union was able to set rate zones based on the gas supply purchases, as the Union North West was primarily served by Empress and the Union North East and Union South were primarily served by Dawn. Based on the proposed service areas, the North and East service areas are served by a blend of both Empress and Dawn supply. The Union rate zones also did not have boundary concerns, as Union North and Union South were separate geographic locations. As such, the approach used for the Union rate zones is no longer practical for Enbridge Gas on a combined basis. The one rate zone approach, however, is consistent with the EGD rate zone, which had common rates for the Enbridge CDA (including Toronto and Niagara) and Enbridge EDA.

Enbridge Gas considered various rate zone alternatives for gas supply costs, which are provided at Exhibit 8, Tab 2, Schedule 1, Section 1.5.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 1, pg. 10, Table 1

Question(s):

Please explain the drivers that generate the difference in supply for the Bridge Year and Test Year for each of the respective supply sources:

- a) Ontario / Dawn
- b) Unsecured
- c) Western Canadian Sedimentary Basin

Response:

Unsecured supply is planned, but uncontracted, services required to meet forecasted design day demand requirements. Ontario/Dawn represents planned Dawn purchases required to meet annual demand. Unsecured supply could potentially be sourced from Dawn depending on the contracted service.

- a) The planned Ontario/Dawn supply volume is lower in the Test Year as compared to the Bridge Year as a result of higher supplies delivered from other sources. Most notably, increased utilization of transportation services from the Western Canadian Sedimentary Basin (as outlined in part c) below), and the planned introduction of certain unsecured supply services reduce the planned need for Dawn supply.
- b) The planned unsecured supply volume has increased in the Test Year as compared to the Bridge Year due to the assumption that transportation services will be used to manage increased design day demand requirements. As provided at Exhibit 4, Tab 2, Schedule 1, page 2, "Enbridge Gas will not contract for these uncontracted assets until OEB approval is received".
- c) The planned Western Canadian Sedimentary Basin supply volume has increased in the Test Year as compared to the Bridge Year as a result of increased utilization of

long-haul transportation services to serve the increase in annual demand, as well as increased utilization of long-haul transportation in the summer months.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 1, pg. 10, Table 1

Question(s):

Please define Unsecured and describe how Unsecured would be differentiated from Ontario/Dawn.

Response:

Please see response at Exhibit I.4.2-FRPO-86.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 1, pg. 10-11, Table 2 & Attachment 1
and EB-2022-0072 EGI Gas Supply Update, page 57, Table 25

Preamble:

Table 2 shows an almost tripling of Vector's contribution to Demand between the Bridge Year and Test Year.

Question(s):

Please reconcile these amounts with those provided in the Gas Supply update Table 25 referenced above.

- a) Using forward market pricing from a published source (e.g. Platts), please provide the landed cost price at Dawn for 2023 and 2024 for gas delivered on Vector and gas sourced at Dawn.
- b) Please provide justification for the almost tripling of commitment to this path.
- c) Please explain why the transportation costs for Vector in Attachment 1, pg. 1 are very flat between 2023 and 2024.
- d) For the now current winter of 2022/23, what percentage of transportation contracts on the Vector path are assigned to a third party?
- e) If these current contracts contribute to in-franchise demand, please describe how the contracts are deemed to be temporarily surplus aligned with the definition approved by the Board in EB-2013-0146 Decision and Order, pg. 5.

Response:

Information presented in the 2022 Annual Gas Supply Plan Update¹ is based on existing rate zone classification whereas the 2024 information provided at Exhibit 4, Tab 2, Schedule 1, page 11, Table 2 reflects one rate zone.

Please see response at Exhibit I.4.2-TCPL-7 part d), for the explanation of this change.

- a) Please see Attachment 1.
- b) Enbridge Gas has not forecasted changes to its contracted Vector capacity between 2023 and 2024. Please see response at Exhibit I.4.2-TCPL-7 part d).
- c) The transportation costs for Vector, shown on line 15 of Exhibit 4, Tab 2, Schedule 1, Attachment 1, are relatively flat between 2023 and 2024 because Enbridge Gas has not forecasted changes to its contracted Vector capacity between these years.
- d) Due to current market conditions, for the period November 1, 2022 to March 31, 2023, Enbridge Gas has assigned 100% of its U.S. Vector capacity from Chicago to Vector St. Clair to third parties. Enbridge Gas retained the Canadian Vector capacity from St. Clair to Dawn and purchased supply at Vector St. Clair from those parties.
- e) Please see response at Exhibit I.3.4-FRPO-75.

¹ EB-2022-0072.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 1, pg. 15 & Table 3

Preamble:

EGI evidence states: *Finally, the capacity contracted with 2193914 Canada Limited is required to move gas to Brampton and the Greater Toronto Area on the design day.*

We would like to understand more about this pipeline.

Question(s):

Please confirm this pipeline is owned by Enbridge Gas Distribution Limited.

- a) Is this a separate pipeline or is it somehow a fraction of the pipeline that was built between Parkway and Albion as a result of approvals in the GTA Reinforcement proceeding EB-2012-0451?
 - i. If this pipeline is the one described in a), what is the total capacity of that pipeline?
 - ii. Does the pipeline deliver capacity to the GTA as part of the EGD rate zone?
- b) Is this capacity regulated by the OEB or NEB?
 - i. If the NEB, please describe why.
- c) What is the purpose of segmenting ownership of this pipeline under an affiliate company?
 - i. Are decisions in regard to capacity allocation, preventative maintenance, etc., under the direct control of EGI?
 - ii. Is the capacity in EGI rate base or is there a transfer price in the Enbridge Inc. organization to recover costs?

Response:

a-c) As indicated on the Enbridge Gas organizational chart at Exhibit 1, Tab 3, Schedule 1, Attachment 1, 2193914 Canada Limited (219) is a wholly owned subsidiary of

Enbridge Inc. This pipeline system is not related to the GTA pipeline that was the subject of the EB-2012-0451 proceeding.

The 219 pipeline system consists of two pipeline segments that were purchased from TransCanada PipeLines Limited (TCPL) in 1987 and 1993.

The purchase and sale of the 219 pipelines were reviewed and approved by the predecessor to the Canada Energy Regulator (CER), the National Energy Board (NEB), and because these pipelines remain within TCPL's right of way and the land arrangement was approved by the NEB, the pipelines remain under CER jurisdiction.

Enbridge Gas is the only customer on the 219 pipelines and therefore takes 100% of the capacity (indicated in Table 3) and pays 100% of the cost of service as part of its gas supply portfolio. The 219 company has no employees and it is therefore operated by Enbridge Gas as an integrated part of the Enbridge Gas distribution system.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 1, pg. 17 and EB-2022-0086 Exhibit JT1.4

Preamble:

EGI evidence states: *EGD managed operational contingency requirements through cost-based storage injection and withdrawal targets rather than procuring incremental storage space for operational contingency purposes. Effective 2024, Enbridge Gas plans to adopt the approach of managing operational contingency using cost-based storage inventory targets and has incorporated the storage space and molecule requirements provided at Exhibit 4, Tab 2, Schedule 4 in the Gas Supply Plan.*

We are interested in the evolution of the storage owned and operated by EGD prior to amalgamation and the evolution of storage utilization once the companies were merged, or, perhaps, initiated prior to when notice was given the Board of the request to merge.

Question(s):

The following questions are specific to EGD-owned storage:

- a) Please confirm or correct that:
 - i. At the time of the 2013 rebasing of rates, of the 99.4 PJ of storage held for in-franchise customers, EGD targeted a February 28th minimum inventory level of 18.5 PJ to provide late season deliverability.
 - ii. After re-evaluating its approach to purchasing after the winter of 2013/14, EGD increased its targeted February 28th minimum inventory level to 43.5 PJ.

- b) Beyond adjusting Month End Storage Balances in QRAM and other applications, did EGD first provide evidence of this change in gas supply strategy to adjust targeted February 28th inventory to the Board to seek approval?
 - i. If so, please specify the evidentiary reference and any approvals received from the Board.

- ii. In a table, for each winter starting in 2012/13, please provide the amount of market-based storage under contract to EGD to use to meet in-franchise needs.
 - iii. In a table, for that same period, for each winter, please provide the amount of non-utility storage that EGD had available for customers (both ex-franchise and any incremental purchases for in-franchise customers).
- c) Prior to the Enbridge Inc. (EI) purchase of Spectra, did EGD allocate any of the costs associated with increasing the Feb. 28th inventory including incremental storage purchases to the non-utility storage?
- i. If not, why not?
- d) After EI purchased Spectra, was there any change to the targeted Feb. 28th minimum inventory in the EGD storage assets?
- i. If so, what was the change and how was it determined and evidenced to the Board?
- e) In a scenario where the Feb. 28th inventory had dropped to a much lower level, say 18.5PJ, would EGI be able to meet all in-franchise peak day deliverability from Dawn and all non-utility storage firm contractual commitments?
- i. Please explain fully.
 - ii. Are any of the costs associated with the 43.5 PJ minimum threshold allocated to the non-utility including:
 - (1) Cost of storage space?
 - (2) Cost of inventory?
 - (3) Cost of additional market-based storage to facilitate an increase in minimum inventory to 43.5 PJ on Feb. 28th?
 - (4) If not, why not?
- f) Please provide the first completed analysis of the integration of Union Gas' Dawn assets with those of EGD providing storage.
- g) Please provide the completed Injection Withdrawal schedule for EGD Storage assets for the year prior to integration with Dawn.
- h) Please provide the completed Injection Withdrawal schedule for the assets previously held by EGD Storage for the year after integration with Dawn.
- i) Please provide the completed Injection Withdrawal schedule for the assets previously held by EGD Storage for the winter of 2022/23.

Response:

- a)
- i. At the time of 2013 Cost of Service, EGD regulated storage for in-franchise bundled customers equaled 99.4 PJ and the planned February 28, 2013 storage balance for this storage was 21.4 PJ. The referenced 18.5 PJ value corresponds with the planned February 28, 2014 storage balance.
 - ii. After customers were exposed to significant supply costs late in the polar vortex winter of 2013/2014, EGD reevaluated its Gas Supply Plan and adjusted its planned strategy to set an end-of-February minimum storage balance target at the point where maximum deliverability from the 99.4 PJ storage begins to decline, which is 43.8% of maximum storage balance, or 43.5 PJ.
- b)
- i. This topic was discussed extensively as part of the OEB's 2014 Natural Gas Market Review proceeding¹ and the Enbridge Gas Distribution 2015 Rate Adjustment proceeding².

As noted in the Dawn to Corunna Replacement Project proceeding³, in response to interrogatory FRPO.23⁴:

“At the time, Enbridge Gas Distribution Inc. (“EGD”) provided a description of this change in the planned operation of utility customer storage assets to the OEB at EB-2015-0114, Exhibit D1, Tab 2, Schedule 1, p. 9. EGD did not seek OEB approval for this planning change, and the OEB did not raise any issues in this regard.”

Enbridge Gas has also made reference to its storage inventory targets in each of its 5-Year Gas Supply Plan⁵ and its Annual Gas Supply Plan Updates in 2020⁶, 2021⁷, and 2022⁸.

- ii. Please see Table 1.

¹ EB-2014.0289.

² EB-2014-0276.

³ EB-2022-0086.

⁴ EB-2022-0086, Exhibit I.FRPO.23.

⁵ EB-2019-0135.

⁶ EB-2020-0135.

⁷ EB-2021-0004.

⁸ Eb-2022-0072.

Table 1
EGD – Market Based Storage

<u>Year</u>	<u>Market Based Storage (PJ)</u>
2012-2013	22.7
2013-2014	23.7
2014-2015	24.4
2015-2016	24.3
2016-2017	24.5
2017-2018	24.4
2018-2019	26.4
2019-2020	26.4
2020-2021	26.5
2021-2022	26.2
2022-2023	26.1

- iii. Please see response at Exhibit.I.4.3-FRPO-149 part b) Tables 2 and 3.
- c) Prior to the Enbridge Inc. purchase of Spectra, EGI did not allocate any of the costs associated with increasing the Feb. 28th inventory including incremental storage purchases to the non-utility storage business.
- The end of February minimum inventory target of 43.5 PJ is included as part of total utility storage inventory of 99.4 PJ and all the associated design day deliverability (1.9 PJ) is used to serve the utility. The non-utility storage customers have assets in place to provide their design day deliverability and the costs are allocated to the non-utility business.
- d) There was no change to the end of February minimum inventory target as a result of Enbridge Inc's acquisition of Spectra Energy. Additional information related to the integration of storage operations can be found in response at Exhibit I.4.2-FRPO-126.
- e)
- i. If the end of February actual inventory balance was reduced below the minimum inventory target of 43.5 PJ, Enbridge Gas would not be able to meet its peak day requirements for utility customers using storage deliverability. As a result, Enbridge Gas would need to increase its reliance on Dawn purchases to meet peak day requirements. Non-utility customers are not reflected in Exhibit 4.2.1 and therefore, Enbridge Gas has not considered impacts to non-utility customers as part of this interrogatory.
- ii. Please see response at part c).

- f) Please see response at Exhibit I.4.2-FRPO-126.
- g) Please see Attachment 1. Prior to 2018, EGD completed an injection schedule and did not complete a withdrawal schedule.
- h) Please see Attachment 2 and Attachment 3.
- i) Please see Attachment 4 and Attachment 5.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 1, pg. 17 and EB-2022-0086 Exhibit JT1.4

Preamble:

For the purposes of comparison, we would like to understand how Union Gas approached the issue.

Question(s):

In a table, starting the winter of 2012/13, for each winter, please provide the amount of non-utility storage that Union Gas Ltd. had available for customers (both ex-franchise and any incremental purchases for in-franchise customers).

Response:

Please see response at Exhibit.I.4.3-FRPO-149 part b), Table 1 for the amount of non-utility storage Union had available for customers. Union did not make any incremental storage purchases for in-franchise customers.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 1, pg. 17 and EB-2022-0086 Exhibit JT1.4

Preamble:

For the purposes of comparison, we would like to understand how Union Gas approached the issue.

Question(s):

What was the targeted minimum February 28th balance for the Union Gas in-franchise storage for each of the winters starting with 2012/13?

Response:

The planned minimum end of February storage balance for Union Gas in-franchise customers was as follows:

Table 1
Feb 28 Planned Storage Balance

	<u>Planned Storage Balance (PJ)</u>
2012-2013	18.6
2013-2014	19.2
2014-2015	19.8
2015-2016	19.1
2016-2017	19.1
2017-2018	19.0
2018-2019	19.3
2019-2020	20.4
2020-2021	20.7
2021-2022	18.6
2022-2023	20.0

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 1, pg. 18-20

Preamble:

EGL evidence states: *The total storage space of 217.7 PJ was determined using the aggregate excess calculation of 202.7 PJ and t-service storage requirement of 15 PJ.*

Question(s):

Please specify the existing rate classes that are under the “t-service storage.”

- a) What distinguishes the characteristics of the t-service storage from the remaining storage?
- b) Please provide the existing allocation of space and deliverability to these rate classes and a description of the methodology.
 - i. If this determination of the existing allocation and associated deliverability is available in evidence, please provide the specific reference.
- c) Please provide the allocation to these rate classes and a description of the methodology for the 2024 proposed allocation.
- d) Please provide the existing allocation of the 202.7 PJ and associated deliverability to each of the existing rate classes.

Response:

T-Service storage requirement refers to storage space contracted by Union South semi-unbundled customers in Rate T1, Rate T2 and Rate T3 and the Union North unbundled (T-Service) storage service in Rate 20 and Rate 100.

- a) The distinguishing factor is that the storage requirements are contracted for by the customer based on storage allocation methodologies and managed by the customer.

b-c) Please see Table 1 for the 2013 and 2024 allocation of storage deliverability and storage space for T-Service customers.

Table 1
T-Service Storage Allocation

Line No.	Allocation Factors (TJ)	Union North		Union South		
		Rate 20 (a)	Rate 100 (b)	Rate T1 (c)	Rate T2 (d)	Rate T3 (e)
<u>2013 Cost Allocation Study</u>						
1	Storage Deliverability	8	1	55	236	57
2	Storage Space	769	121	1,866	8,837	3,051
<u>2024 Cost Allocation Study</u>						
3	Storage Deliverability	12	-	34	211	54
4	Storage Space	983	-	1,485	9,403	3,206

In Union's 2013 Cost Allocation Study, storage deliverability costs were allocated to T-Service customers based on aggregate excess and storage space costs were allocated based on the contracted storage space.

A description of the proposed methodology for the allocation of storage deliverability and storage space is provided at Exhibit 7, Tab 1, Schedule 2, pages 17-18.

A comparison of the existing and proposed cost allocation methodologies of storage space and storage deliverability for Union North and Union South are provided at Exhibit 7, Tab 1, Schedule 3, page 2.

The current storage allocation methodologies that customers are able to contract for, including the evidence reference, are listed below for the Union North and Union South rate zones. There are currently no unbundled customers in the EGD rate zone with an allocation of cost-based storage.

- For customers in the Union North rate zone, please see Exhibit 8, Tab 4, Schedule 5, page 7;
- For customers in the Union South rate zone with an obligated DCQ for all of their deliveries, please see Exhibit 8, Tab 4, Schedule 4, pages 6-7; and
- For customers in the Union South rate zone with a non-obligated DCQ at Dawn, please see Exhibit 8, Tab 4, Schedule 5, pages 9-11.

d) Please see Table 2.

Table 2
Storage Allocation to Bundled Rate Classes

Line No.	Particulars (TJ)	2024 Allocation Factor	
		Storage Deliverability	Storage Space

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 1, pg. 18-20

Preamble:

EGI evidence states: *The total storage space of 217.7 PJ was determined using the aggregate excess calculation of 202.7 PJ and t-service storage requirement of 15 PJ.*

Question(s):

How much total space and market-based storage did EGI hold for the winter of 2022/23?

- a) Please confirm or clarify that this amount of market-based storage would be included in the total space.

Response:

Table 1 includes a summary of Enbridge Gas's storage portfolio for Winter 2022/2023.

Table 1
Enbridge Gas Storage Portfolio (PJ)

	Winter 2022-2023
Dawn	96.5
Tecumseh	99.4
Crowland	0.3
Market-Based Storage	26.1
Total In-Franchise Storage Requirements	222.3

This information can also be found in Enbridge Gas's 2023 Gas Supply Plan Annual Update, Table 6¹.

¹ EB-2023-0072.

a) Confirmed, please see Table 1.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 1, pg. 18-20

Preamble:

Footnote 12 on the bottom of page 19 states: *As noted above, effective January 1, 2024, Enbridge Gas will utilize cost-based storage injection and withdrawal targets rather than procuring incremental storage space for operational contingency purposes.*

Question(s):

Please provide the monthly storage targets in tabular form for the following scenarios:

- a) Please provide the Union Rate Zone monthly storage targets throughout the year for the years 2019-2022.
- b) Please provide the proposed Union Rate Zone monthly storage targets for 2024-2025.
- c) Please provide the Enbridge Rate Zone monthly storage targets throughout the year for the years 2019-2022.
- d) Please provide the proposed Enbridge Rate Zone monthly storage targets for 2024-2025.

Response:

- a) Union rate zone planned storage balances are applicable to end of month balances for February, March, and October. Table 1 provides a summary of Union rate zone planned storage balances for the years 2019 to 2022.

Table 1
Union Rate Zones Storage Targets (PJ)

	Feb (a)	Mar (b)	Oct (c)
2019-2020	20.4	6.0	79.1
2020-2021	20.7	6.0	79.6
2021-2022	18.6	6.0	79.1

For the end of October planned storage balance, the total 100 PJ of cost-based storage is reduced by the storage requirements for T-Service customers and excess utility space.

- b) As a result of harmonization to a single rate zone, there is no storage target applicable to the EGD rate zone or Union rate zones effective January 1, 2024.

Table 2 provides applicable end of month 2024 storage targets for Enbridge Gas based on the proposal for one rate zone:

Table 2
Enbridge Gas Storage Targets (PJ)

	Feb (a)	Mar (b)	Apr (c)	Oct (d)
2024-2025	70.4	25.0	10.8	178.8

For the end of October planned storage balance, the total 199.4 PJ of cost-based storage is reduced by the storage requirements for T-Service customers and contingency space.

- c) EGD rate zone storage targets are applicable to end of month balances for February, March and October. Table 3 provides a summary of EGD rate zone storage targets for the years 2019 to 2022:

Table 3
EGD Rate Zones Storage Targets (PJ)

	Feb (a)	Mar (b)	Oct (c)
2019-2020	43.5	12.8	99.4
2020-2021	43.5	12.8	99.4
2021-2022	43.5	12.8	99.4

- d) Please see response to part b).

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 1, pg. 18-20

Preamble:

Footnote 12 on the bottom of page 19 states: *As noted above, effective January 1, 2024, Enbridge Gas will utilize cost-based storage injection and withdrawal targets rather than procuring incremental storage space for operational contingency purposes.*

Question(s):

Please reconcile the above referenced statement with the evidence on Operational Contingency in Ex. 4, Tab 2, Schedule 4.

Response:

The operational contingency evidence¹ includes the following:

15.6 PJ of operational contingency will be required to support the reliability and resilience of the Enbridge Gas storage, transmission, and distribution systems. Operational contingency requirements will be managed through injection and withdrawal targets rather than procuring additional storage space. This will result in a 9.5 PJ (current Union rate zone operational contingency) reduction in the in-franchise storage space requirements.

This is consistent with the referenced statement included in the preamble. The operational contingency will be managed through the utilization of cost based storage and the associated injection and withdrawal targets.

¹ Exhibit 4, Tab 2, Schedule 4, page 1, paragraph 2.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 1, pg. 21 & Attachment 1, pg. 2, line 25

Preamble:

EGL evidence states: *Storage (injection)/withdrawal costs are comprised of the cost associated with the net injections to/withdrawals from storage to balance the difference between annual gas supply and annual demand.*

Question(s):

Please provide a comprehensive description and a numeric example of how storage injection and storage withdrawal costs are determined.

a) For clarity, please provide an example using M1 in the Union Rate Zone.

Response:

The storage (injection)/withdrawal cost provided at Exhibit 4, Tab 2, Schedule 1, Attachment 1, page 2, line 25 are the gas commodity costs associated with the net volume injected to/withdrawn from storage each year as a result of the imbalance between the annual gas supply and annual demand.

In months when demand is higher than the gas supply, gas is required to be withdrawn out of storage to meet customer demand. The commodity costs associated with the net volumes withdrawn from storage are the withdrawal costs. In months where gas supply exceeds customer demand, there is excess supply which is injected into storage. The commodity costs associated with the net volumes injected into storage are the injection costs.

a) Please see Attachment 1 for the detailed calculations of the storage injection and storage withdrawal costs for the 2024 Test Year, as provided at Exhibit 4, Tab 2, Schedule 1, Attachment 1, page 2, line 25 and Exhibit 4, Tab 2, Schedule 1,

Attachment 1, page 4, line 2.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 1, pg. 21 & Attachment 1, pg. 2, line 25

Preamble:

EGL evidence states: *Storage (injection)/withdrawal costs are comprised of the cost associated with the net injections to/withdrawals from storage to balance the difference between annual gas supply and annual demand.*

Question(s):

Please describe and quantify the drivers of the variation in storage injection/withdrawal costs that result in significant year over year swings in actual cost and an overall reduction of 96% between 2017 and 2021, as shown in Attachment 1.

- a) Please ensure the description refers also to the components of cost provided for the determination requested above.

Response:

As described in response at Exhibit I.4.2-FRPO-97, the storage injection/withdrawal costs provided at Exhibit 4, Tab 2, Schedule 1, Attachment 1, page 2, line 25 are the commodity costs associated with the imbalance between the annual gas supply and annual demand. Exhibit I.4.2-FRPO-97, Attachment 1 provides the detail of the components of cost used to derive the storage injection/withdrawal costs.

The net imbalance of gas volumes can vary each year as a result of fluctuations in supply and demand volumes impacted by various factors, such as weather volatility and changes in customer demand. The storage injection/withdrawal costs are also subject to impacts from fluctuations in the reference price.

- a) Please see response above.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 1, p.22-23

Preamble:

EGL evidence states: *On an actual basis, load balancing requirements may be higher than planned due to customer demand being above normal. Enbridge Gas will manage these unplanned load balancing requirements for system customers only. Unplanned load balancing requirements may be met through storage withdrawals, incremental supply purchases, and third-party services. Bundled DP customers will be responsible for their own unplanned load balancing requirements through their obligation to meet their checkpoints at the end of February and September each year.*

Question(s):

Historically, has EGL bought additional load balancing gas if storage level does not project to meet target even if system supply balance is on track?

- a) In this application, is EGL proposing any change to its approach with this application? If so, please explain.

Response:

Historically, Enbridge Gas has managed the incremental load balancing requirements of DP customers in the EGD rate zone and the Union North rate zone. Enbridge Gas has also managed the incremental load balancing requirements, when applicable, of DP customers in the Union South rate zone after their February 28 checkpoint.

- a) Please see Exhibit 8, Tab 4, Schedule 3 for a description of existing and proposed DP customer load balancing obligations.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 1, p.26

Preamble:

EGL evidence states: *Enbridge Gas plans to use purchases at Dawn to meet planned load balancing requirements in the winter months.*

We would like to understand more about these planned purchases for load balancing requirements. Please understand that the following questions relate to load balancing purchases as opposed to specific commodity purchases associated with system gas only requirements. If system gas needs are included in these planned purchases, please differentiate the system gas purchases in the answers.

Question(s):

For these load balancing requirements, planned purchases at Dawn, please provide:

- a) How much will EGL plan to purchase for:
 - i. For each month for the Union Rate Zone
 - ii. For each month for the Enbridge Rate Zone
- b) How long in advance will the price of those purchases be fixed?
- c) What is the maximum period of time in advance of delivery that EGL will fix the price?
- d) Please provide the specific Board reference ordering this limitation.
 - i. Whether there is a specific Board order or not, please provide the internal EGL policy that guides the purchase strategy.
- e) What are EGL's views on the opportunity to stabilize its load balancing costs through Dawn deliveries of gas for which the price is fixed months or a year or more in advance?
 - i. What are EGL's views on whether the Board would need to approve or order such an approach or is it in the discretion of a utility with a balanced load balancing portfolio?

Response:

All gas commodity purchases made by Enbridge Gas are purchases of a molecule for use in the system gas portfolio. The act of weighting these supply purchases to winter months generates a load balancing benefit for both system and direct purchase customers. It is not possible to segment planned Dawn purchases from “load balancing” purchases, nor is it possible to “differentiate system gas purchases” from “load balancing purchases”.

a) Enbridge Gas’s proposed Gas Supply Plan was prepared as a single rate zone and has not separated requirements for legacy rate zones. Please see Exhibit 4, Tab 2, Schedule 1, Attachment 1, page 5, for load balancing calculations for the single rate zone.

b-d) Please see response at Exhibit I.4.2-FRPO-82.

e) Contracting commodity load balancing purchases months or years in advance of delivery at fixed prices poses several challenges.

First, Enbridge Gas does not believe the practice of contracting commodity load balancing purchases months or years in advance at fixed prices is aligned with the direction provided to EGD and Union by the OEB in the EB-2006-0034, EB-2007-0606, and EB-2007-0615 proceedings. For more details, please see response at Exhibit I.4.2-FRPO-82.

Second, planned and unplanned load balancing requirements are subject to actual winter demand. Committing to take delivery of firm gas supply above that of average day demand many months or years ahead of the winter period may result in unnecessary deliveries of gas to the system during warmer than normal winters. Not only would these purchases create an unnecessary cost for ratepayers because gas is being purchased for months that are typically higher priced than others, but in the case of load balancing supply for the northern portion of the system or during shoulder months, Enbridge Gas may be unable to receive the contracted deliveries in the event they exceed customer demands on a given day. In this scenario, Enbridge Gas would either need to inject gas into storage (if available injection capability exists) or costs may be incurred to amend the firm delivery transaction with the supplier.

Third, there is no guarantee that purchasing a long-term fixed price contract will result in a lower price for commodity load balancing purchases. Long-term fixed price transactions are a form of physical hedge designed to reduce volatility and can often result in a higher cost than indexed purchases.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 1, Attachment 1

Preamble:

We would like to understand the derivation of the provided costs.

Question(s):

For Supply Costs on page 1, please provide the unit costs used for each of the Bridge Year and the Test Year.

- a) What is the forecast date when the data was drawn?
- b) Were the forecasted receipt point costs sourced from the forward market or provided by ICF or another study?
 - i. If the forward market, please provide an extract of the prices used and the publishing source.
- c) If ICF provided the data, please provide the forward market prices from a published source produced for the same date that ICF produced their forecast.
- d) On lines 12 and 13, the costs for TCPL Transport increase significantly. Given that TCPL's tolls are virtually fixed or perhaps decreasing, what causes the increase for both lines going from 2023 to 2024?

Response:

a-c) As outlined in Exhibit 4, Tab 2, Schedule 1, page 9, the 2024 Test Year Gas Supply Plan and 2023 Bridge Year Gas Supply Plan were completed in the second quarter of 2022 and use a monthly commodity price forecast based on the April 1, 2022, QRAM commodity prices, provided at Exhibit 4, Tab 2, Schedule 1, Attachment 2. The pricing consists of forward market settlement prices over a 21-day period from

January 31, 2022 to February 28, 2022, consistent with the price data used in the April 2022 QRAM filing.

The locational gas price data provided at Exhibit 4, Tab 2, Schedule 1, Attachment 2 consists of NYMEX Henry Hub futures settlement data sourced from CME Group and forward basis prices sourced from Kiorex. The foreign exchange rates have been sourced from Bloomberg. Enbridge Gas has purchased a subscription from each of these sources and has obtained permission to file this information.

- d) Please see Attachment 1 for an updated Summary of Gas Costs¹ which aligns the presentation of the 2017 to 2023 TCPL Transportation costs in lines 12 and 13 and the Dawn Parkway Transportation costs in line 28 with the 2024 Test Year presentation. There is no change to the total utility cost of gas in line 35. The costs for TCPL Transport has increased minimally from 2023 to 2024 as shown on lines 12 and 13 of Attachment 1.

¹ Exhibit 4, Tab 2, Schedule 1, Attachment 1, pages 1 and 2.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 1, Attachment 1

Preamble:

We would like to understand the derivation of the provided costs.

Question(s):

On page 3, please explain why, although about 20% of the system supply source originates in the WCSB, there are no costs for TCPL from Empress for system gas.

- a) How can the transportation costs be separated from supply costs for the purposes of setting the gas supply rate?

Response:

There are no TCPL costs from Empress included in the proposed gas cost reference price and gas supply commodity charge, as these costs are proposed to be recovered in the gas supply transportation charge.

- a) The TCPL costs from Empress are incurred on behalf of and recovered from both sales service and bundled direct purchase customers. By including the TCPL costs from Empress in the gas supply transportation charge, a separate transportation charge for sales service and bundled direct purchase is not required¹.

This rate design is similar to the rate design for the EGD and Union North West rate zones, in which the gas supply charge is set based on the Western Canada price at Empress and Alberta Border reference price, respectively, and the TCPL costs from Empress are recovered in gas supply transportation charges.

¹ Enbridge Gas is proposing a gas supply transportation charge for customers taking sales service or bundled direct purchase with a Dawn, Parkway, or Enbridge CDA obligation point of receipt. Enbridge Gas is proposing a Western transportation charge for bundled direct purchase customers with an Empress obligated point of receipt.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 1, Attachment 1

Preamble:

We would like to understand the derivation of the provided costs.

Question(s):

On page 4, EGI provides the storage costs on line 2. Please provide a disaggregation of the costs associated with cost-based storage and market based storage:

- a) In tabular form, please provide the unit demand costs associated with:
 - i. Space demand costs
 - ii. Deliverability (withdrawal and injection demand costs)
 - iii. Fuel unit costs
 - iv. Other costs, if any, not included above.
- b) Specific to deliverability, please describe how the deliverability demand costs are derived.
 - i. Please provide the working Excel sheet that provides the components of this calculation complete with evidentiary references.
- c) Please provide the annual actual measures of space and deliverability for both cost based and market based storage for the 2018-2022 period by Rate zone.

Response:

- a-b) Please see response at Exhibit I.4.2-FRPO-97 for the description and calculation of the storage (injection)/withdrawal cost as provided at Exhibit 4, Tab 2, Schedule 1, Attachment 1, page 4, line 2.

The 2024 Test Year Forecast of market-based storage costs is \$13.9 million. This amount consists of \$13.2 million in demand charges as shown in Exhibit 4, Tab 2, Schedule 1, Attachment 1, page 4, line 14, and \$0.7 million of fuel charges as provided at Exhibit 7, Tab 1, Schedule 1, page 12.

Market-based storage services do not stipulate separate cost components for storage space and deliverability. These services typically contain a fixed monthly demand charge, a commodity charge applied to injections and withdrawals, and a fuel charge. Not all market-based storage contracts that Enbridge Gas has purchased contain commodity charges or fuel charges.

The detailed explanation of the classification of Enbridge Gas cost-based and market-based storage costs between storage space and deliverability is provided at Exhibit 7, Tab 1, Schedule 2, Section 2.2, pages 9 to 10. The classification of specific costs items between storage space and deliverability can be found in the Cost Allocation Study provided at Exhibit 7, Tab 2, Schedule 1, Attachment 5. The Cost Allocation Study has been filed in excel format in response at Exhibit I.7.1-IGUA-72.

- c) Enbridge Gas does not allocate costs between storage deliverability and space on an annual basis. The classification of storage costs to deliverability and space is only done through the cost allocation process for the purposes of rate setting. As such, the classification for the 2018 to 2022 period by rate zone is not available.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 1, Attachment 1

Preamble:

We would like to understand the derivation of the provided costs.

Question(s):

Page 5 provides the load balancing deliveries. To be able to see these deliveries in context, please provide the monthly deliveries to Dawn for system supply.

- a) Please explain how the profile of load balancing supplies is developed.
- b) Please ensure the explanation provides reasoning for zero supplies for a high demand month such as March.

Response:

Exhibit 4, Tab 2, Schedule 1, Attachment 1, page 5 represents monthly deliveries for system supply. Direct purchase customers are responsible for their own load balancing supply.

- a) The profile of load balancing supplies is the result of Enbridge Gas optimizing the balance of supply with the forecasted demand profile in a least-cost manner, while taking into account the commercial parameters of Enbridge Gas's planned portfolio of transportation and storage services.
- b) There are zero load balancing supplies in March because the planning assumption to hold a minimum storage balance at the end of February to provide maximum deliverability from cost based storage allows for March load balancing needs to be served through storage withdrawals on a planned basis.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 1, Attachment 1

Preamble:

We would like to understand the derivation of the provided costs.

Question(s):

Page 6, line 8 presents the Customer Supplied Fuel.

- a) How does EGI calculate the amount of fuel forecasted for Customer Supplied Fuel?
- b) How does EGI determine the actual amount of fuel used by Customers who supply their own fuel?
- c) Please file the most recent reconciliation of Customer Supplied Fuel between forecasted and actual.
- d) Please confirm that some market-based storage contracts have no fuel requirements for injection or withdrawal.
 - i. How is that fuel provided? Please describe who is accountable for that fuel and explain how the company ensures that there are appropriate allocations that shield in-franchise customers from this cost obligation.

Response:

- a) The forecast customer supplied fuel amount is calculated by applying forecasted customer supplied fuel volume to the proposed weighted average reference price of \$5.309/GJ. The customer supplied fuel volume is calculated by applying the 2023 transportation fuel ratios as approved in the 2023 Rate Order¹ to the forecasted throughput volumes.

¹ EB-2022-0133.

- b) Enbridge Gas trues up for actual compressor fuel used on the Dawn Parkway System by Rate M12 customers per the Yearly Commodity Required (YCR) process outlined in the Rate M12 rate schedule. The true-up relates to the compressor fuel used at the Lobo, Bright and Parkway compressor stations. Actual fuel used is determined by the proportionate transportation through the compressor station. On a quarterly basis, Enbridge Gas compares the actual amount of compressor fuel used by Rate M12 customers and compares it to the fuel provided related to those stations. The difference is refunded or collected from each customer quarterly depending on the difference between actual and forecast fuel use. No other fuel is trued up on the Enbridge Gas system.
- c) The reconciliation of customer supplied fuel between forecasted and actual is calculated through the determination of variances for the individual components that are recovered through the collection of customer supplied fuel, including the recovery of both compressor fuel and unaccounted for gas (UFG).

Part b) details the process for reconciling forecast and actual compressor fuel and the means for recovery/disposition of the variance. Table 1 details the most recent reconciliation of compressor fuel through the YCR process.

Table 1
YCR Fuel Adjustment – Oct to Dec 2022 Quarter

Line No.	Particulars (GJ)	Fuel Provided (a)	Fuel Required (b)	YCR Adjustment (c) = (b-a)
1	Oct-22	317,758	221,791	(95,967)
2	Nov-22	552,956	421,723	(131,233)
3	Dec-22	906,579	741,434	(165,145)

The reconciliation of the forecast and actual costs for UFG is addressed through the annual deferral and variance account disposition proceeding. Attachment 1 includes details of the most recent reconciliation of UFG volumes in the UAFVA for the EGD rate zone and UFG Volume Deferral Account for the Union rate zones from the 2021 Utility Earnings and Deferral and Variance Account application².

- d) Please see response at Exhibit I.4.3-FRPO-152.

² EB 2022-0110, Exhibit D, Tab 1, pp.6-9 and Exhibit E, Tab 1, pp.31-37.

2021 UNACCOUNTED-FOR GAS VARIANCE ACCOUNT

EGD RATE ZONE

1. This evidence provides the volumetric variance underpinning the balance in the 2021 Unaccounted-For Gas Variance Account (UAFVA). It will describe the 2021 variance relative to historical Unaccounted-For Gas (UAF) volumes for the EGD rate zone.
2. UAF is the difference between natural gas delivered into the distribution system as billed by third-party transmission entities (namely, TC Energy and Union Gas¹), and natural gas consumed by the customers in the EGD rate zone and EGD own use gas and line pack gas. Owing to its residual nature, UAF cannot be measured directly. UAF can arise from meter differences, operational or external factors such as line leakage, unmetered uses, and third party damages. In addition, because gas volumes are affected by temperature and pressure, measurement is made more difficult.
3. The 2021 level of UAF for the EGD rate zone was determined to be 115,553 10³m³. The variance of 8,876 10³m³, which is the difference between actual UAF volume and the forecast UAF volume of 106,677 10³m³, underpins the \$0.7 million balance that is captured in the UAFVA. Exhibit D, Tab 1, Schedule 3 provides the detail calculations of the UAFVA balance.
4. The 2019 UAF study was filed as part of the 2020 rate application (EB-2019-0194). The report found that the primary sources for UAF include physical losses, retail meter variation and gate station meter variations. The report noted that

¹ As of January 1, 2019, Union Gas Limited and Enbridge Gas Distribution merged to become Enbridge Gas Inc.

Enbridge Gas' UAF levels are generally lower than competitive gas utilities over the past 10 years. The year-to-year fluctuations are a result of many factors including weather, estimation variation, measurement variation, and billing and accounting adjustments. The practices and initiatives to monitor and manage sources of UAF are generally consistent with those of other gas utilities. As part of the Decision and Order for the 2020 rate application (EB-2019-0194), EGI agreed to provide a "progress report" about the implementation of the UFG report recommendations in its 2022 rates application. A UFG Progress Report was filed as part of EB-2021-0148. The OEB noted that issues related to UFG were out of scope in the 2022 rate application, noting Enbridge Gas's commitment "to assess its UFG forecasting methodology in the 2024 rebasing proceeding and to include information about the implementation of the UFG Report recommendations and other activities to address UFG, and the impacts of such activities."

5. As shown in Tables 1 and 2 in the following pages, UAF within the EGD rate zone has been quite volatile over the years, showing some stability from 2010-2012, and followed by higher levels especially in 2014, 2016, 2018 and 2019. The 2021 UAF level falls within the 95% confidence interval, bounded by (9,125) 10^3m^3 and 167,748 10^3m^3 .

UNACCOUNTED FOR GAS VOLUME DEFERRAL ACCOUNT
UNION RATE ZONES

1. The purpose of the Unaccounted for Gas (UFG) Volume Deferral Account is to capture the difference between the unit cost of UFG recovered in the rates approved by the OEB and actual UFG costs incurred. The amount of the UFG volume deferral account to be cleared to customers is subject to a symmetrical dead-band of \$5.0 million, with amounts within such dead-band being to Enbridge Gas's account.

2. Union rate zones' 2021 Board Approved rates included \$10.1 million in UFG costs. Based on 2021 actual volumes, Enbridge Gas recovered \$10.4 million in UFG costs for 2021. In comparison, Enbridge Gas's actual 2021 UFG costs were \$35.9 million. The difference of \$25.5 million is above the \$5.0 million threshold established by the OEB for the UFG Volume Variance Account. As a result, there is a debit balance of \$20.5 million in the UFG Volume Deferral Account, plus interest of \$0.2 million for a total debit balance of \$20.7 million. See Table 1 below.

Table 1
2021 UTILITY UFG VARIANCES FROM BOARD-APPROVED

Line No.	Particulars	Variance (\$Millions)
1	UFG Cost Included in Rates	\$ 10.1
2	Net Recovery Variance	\$ 0.3
3	Total UFG Collected in 2021 Rates (line 1 + line 2)	\$ 10.4
4	Total Utility UFG Actual Cost	\$ 35.9
5	Total Utility UFG Variance (line 3 - line 4)	-\$ 25.5
6	\$5M UFG Symmetrical Dead-band	\$ 5.0
7	UFG Volume Deferral (receivable)	-\$ 20.5

(1) Board Approved throughput was 32,010 10⁶m³ versus actual throughput of 37,612 10⁶m³

(2) Board Approved UFG % is 0.219% versus actual UFG % of 0.672% for 2021.

3. The methodology for determining the actual UFG expense of \$35.9 million in 2021 is consistent with the methodology historically used to calculate actual UFG for the audited Financial Statements, utility rate setting and earnings calculation.
4. Table 2 and Table 3 provide historical UFG volumes and percentage of throughput for the Union rate zone from 2001 to 2021.

Table 2: Historical UFG Percentage of Throughput for the Union Rate Zone

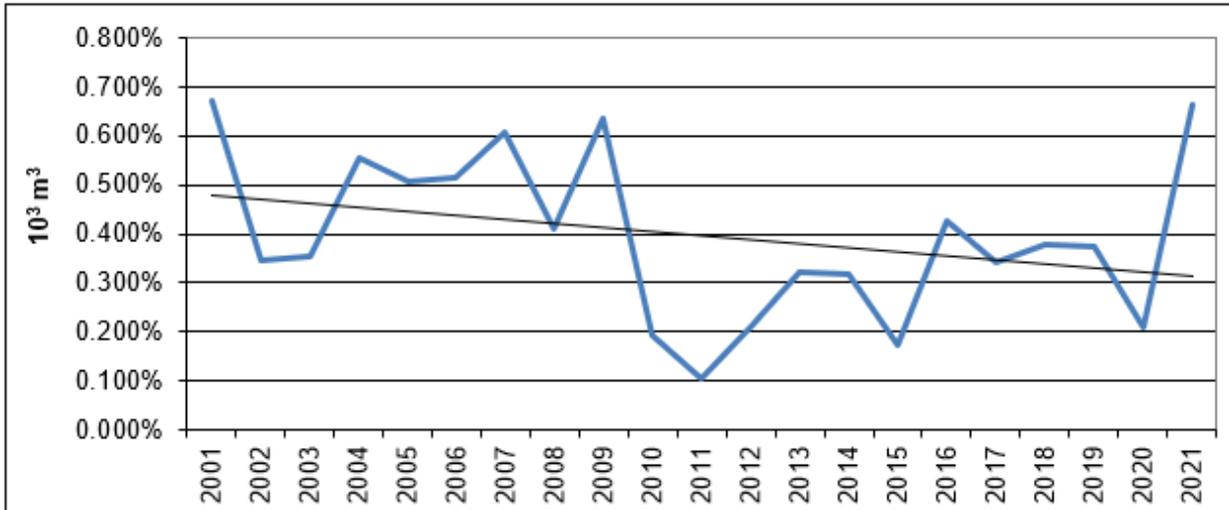

Table 3

<i>Col.1</i>	<i>Col.2</i>	<i>Col.3</i>
Calendar Year	UFG Volumes (10³ m³)	UFG %
2001	184,102	0.673%
2002	109,542	0.344%
2003	108,819	0.356%
2004	176,650	0.554%
2005	169,540	0.507%
2006	154,015	0.516%
2007	203,713	0.609%
2008	143,880	0.411%
2009	201,845	0.637%
2010	67,283	0.192%
2011	35,668	0.105%
2012	68,690	0.210%
2013	113,997	0.320%
2014	97,109	0.318%
2015	54,408	0.174%
2016	131,588	0.427%
2017	108,901	0.342%
2018	136,447	0.379%
2019	137,652	0.376%
2020	74,120	0.208%
2021	252,582	0.672%

- The 0.219% UFG percentage used in approved rates was determined in EB-2011-0210 using the weighted average of the previous three years actual UFG. At the time 2013 rates were set, the most recent three years actual UFG available was 2009 to 2011. The Board approved methodology uses a 3:2:1 weighting with the most recent year weighted most heavily. The result was a ratio for UFG in rates influenced heavily by 2011’s favourable ratio. Concern over the ability to manage UFG relative to the new ratio was a factor in the establishment of a deferral account to capture variances, as was approved in EB-2013-0202.

6. Since the 2013 Board Approved percentage was determined, the average UFG percentage has been 0.356%, for the years of 2013 through 2021. Within that period of 2013 through 2021, the UFG % in 2015 was notably lower than the average, with a corresponding increase in 2016. Similarly, the UFG % in 2020 was lower than the average, with an increase in the UFG % observed in 2021.
7. As was noted in EB-2017-0091 Exhibit B.Staff.9, the increase in UFG volumes experienced in 2016 was primarily driven by a decrease in delivery volumes recorded in January 2016 relating to true-up of estimated consumption recorded in December 2015.
8. A similar decrease and offsetting increase in UFG volumes has been observed between the 2020 and 2021 calendar years. The average UFG % for 2020 and 2021 is 0.440%, which is approximately $163.5 \text{ } 10^3\text{m}^3/\text{year}$ average for the two years. The Company has identified that the true-up of estimated consumption based on the calendarization of UFG volumes has contributed to volatility between 2020 and 2021, but has not resulted in a material increase to the historical average of UFG over the course of two years. Typical estimation true-ups are outlined below.
9. At the end of each reporting period, Enbridge Gas records an estimate of gas delivered but not yet billed. The true-up between the December 2020 estimate and the actual billed volumes resulted in a decrease to the delivery volumes recorded in January 2021. This true-up reflects that, when billings related to December 2020 were completed over the following month, it was determined there was an over-estimate of gas deliveries for December 2020.
10. A second common estimation true-up is known as a prior period adjustment (PPA). PPAs are processed when there is a variance between a billed estimate and actual volumes. The inclusion of PPAs within the annual reported consumption volumes is

consistent with the methodology historically used to calculate actual UFG for the audited Financial Statements, utility rate setting and earnings sharing calculation.

11. The UFG volumes in 2020 were abnormally low compared to the historical average.

The estimation true-up recorded in 2021 caused UFG volumes in 2021 to be elevated. As mentioned, the average of 2020 and 2021 is in line with the historical average of UFG volumes from 2013 to 2021.

12. Enbridge evaluated other factors that could have impacted UFG including, investigating meter reads between custody and check meters for inconsistencies, reviewing accounting processes associated with recording company use and line-pack changes, assessing impacts arising from the transition of Union rate zone customers to the SAP customer information system, and reviewing storage inventory adjustments. These items were deemed to have minimal impact on the elevated level of UFG in 2021. Enbridge is continuing to monitor and address potential contributors to UFG.

13. Volatility in UFG is not uncommon and is experienced across the gas utility industry. The 2019 UFG report prepared by ScottMadden filed in the 2020 Rates Application (EB-2019-0194) noted that:

“....legacy Union and legacy EGD have year-to-year fluctuations in UFG levels that are generally consistent with those of other gas utilities. The fluctuations are a result of many factors, including weather, estimation variation, measurement variation, and billing and accounting adjustments.all gas distribution pipeline systems have UFG as an element of operating a natural gas distribution system and that because of the numerous factors that impact UFG, the UFG percentage will fluctuate over time.¹”

¹ EB-2019-0194, UFG Progress Report, page 4.

14. Enbridge Gas filed the 2019 UFG Study as part of the 2020 rate application (EB-2019-0194). The report found that the primary sources of UFG include physical losses (eg. leaks, third-party damage and venting), metering variations, non-registering meters, theft, line pack and billing and accounting adjustments (such as the estimate of gas delivered but not yet billed required at the end of each reporting period to report results). Although the root causes of UFG are generally known as described above, it continues to be difficult to quantify the individual factors due to their nature. Certain sources of UFG, such as leaks and emissions, contribute to baseline UFG while other sources such as billing, and accounting adjustments contribute to UFG volatility.

15. As committed by the Company in 2020 Rates application (EB 2019-0194), Enbridge Gas will file an update in the 2024 rebasing application about the implementation of the UFG report recommendations and other activities to address UFG, and the impacts of such activities.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 1, Attachment 2

Question(s):

Please provide the source of the pricing data for each of the individual columns.

Response:

Please see response at Exhibit I.4.2-FRPO-101.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 1, Attachment 6

Question(s):

Please provide the commercial arrangements and instructions associated with the ICF study in Attachment 6 including but not limited to:

- a) The RFP, if any.
 - i. If there was no RFP, the over-arching contract under which this study was undertaken.
- b) The terms of engagement.
 - i. If no specific terms of engagement, the documentation from the company to ICF detailing the analysis that was being requested.
- c) All written documentation between EGI and ICF associated with feedback, edits, revisions and/or further instructions.
- d) Specifically, did the company ask ICF to consider and analyze the opportunity to purchase winter month deliveries at a price that was fixed months, or longer in advance as part of the load-balancing portfolio?
 - i. If so, please file that analysis.
 - ii. If not, why not?
- e) Please provide the final cost to generate the study.
 - i. Please provide the cost to generate the report for filing with the EGI evidence package.
 - ii. Please provide the hourly rate(s) of ICF to provide:
 - a. Assistance with Interrogatory Responses
 - b. Testimony at the Technical Conference
 - c. Testimony at the Oral Hearing

Response:

a-e) This issue will be addressed in Phase 2 of the proceeding as noted in Enbridge Gas's February 1, 2023 letter.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 1, Attachment 6

Preamble:

On pg. 5 of the Attachment, the study states: *We also tested each weather scenario using a lower storage capacity gas supply scenario developed with 5 PJ less storage than indicated by the Aggregate Excess methodology to evaluate the impacts of replacing storage capacity with winter purchases at Dawn on supply portfolio costs.*

Question(s):

For the purposes of determining cost impacts, when was it assumed that the price of the gas would be fixed:

- a) On the day needed, week ahead of the forecasted need, month ahead of the forecasted need, etc.
- b) What is the maximum amount of time that EGI fixes the price for the delivery of gas:
 - i. At Dawn?
 - ii. At other supply receipt points?
- c) When the study uses the term “supply portfolio costs,” please explain the presumed allocation of costs for these winter purchases (e.g., landed gas cost, separation of costs between commodity and other accounts, etc.).

Response:

- a) This evidence will be addressed in Phase 2 of the proceeding as noted in Enbridge Gas’s February 1, 2023 letter.
- b) Please see response at Exhibit I.4.2-FRPO-82.
- c) Please see response to part a).

The ICF study is dated October 12, 2002 and Exhibit 2-10 is entitled ICF's April 2022 Base Case.

Question(s):

For Exhibit 4-1, please:

- a) Confirm that the HDD's are on the basis of degrees Fahrenheit.
- b) Explain how the location is derived (i.e., specific city, geographical area, population or consumption weighted, etc.).

Response:

a-b) This evidence will be addressed in Phase 2 of the proceeding as noted in Enbridge Gas's February 1, 2023 letter.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 1, Attachment 6

Preamble:

Appendix E asserts: *Contribution of Storage Deliverability to Design Day Capacity Requirements. Storage deliverability provides a direct contribution to design day system capacity requirements. In the Gas Supply Planning model analysis, changes in storage capacity are addressed through incremental purchases at Dawn. However, purchases at Dawn do not have the degree of reliability provided by storage deliverability. The different in reliability provides significant economic benefit to the use of incremental storage that is not captured in the Gas Supply Planning model analysis.*

Question(s):

During the last major North American test of the gas pipeline systems ability to deliver (known as Super Storm URI during Feb. 13-17, 2021), did EGI experience any failures to deliver of its contracted Dawn deliveries that were not authorized to divert?

- a) If so, were these failures to deliver covered by contractual remedies to keep EGI whole? Please explain.
 - i. What was the impact to ratepayers?
- b) For each of the last five years, please provide the number of compressor failures or unavailability of storage or storage pool compression at Dawn or Corunna.

Response:

Yes.

- a) During Winter Storm Yuri in February 2021, production freeze-offs in the U.S. mid-continent resulted in several suppliers calling force majeure on their contracted deliveries of gas to Enbridge Gas on the Panhandle Eastern Pipeline, which is used to transport gas to Dawn. In instances of force majeure, Enbridge Gas does not

receive any contractual remedy for the lost supply. The total reductions in deliveries to Dawn during this period were limited to 16 TJ and had no significant impact on Enbridge Gas's operations or ratepayers due to the availability of Dawn storage to replace the lost supply.

A more recent example of an extreme weather event is Winter Storm Elliott. This storm swept across North America between December 22 and December 26, 2022, triggering massive blackouts, thousands of cancelled flights, and covering roads in much of Canada and the U.S. in sheets of ice and snow. The deep freeze also had an impact on the pipelines that move natural gas around North America, including those that bring supply to Dawn. Appalachian gas producers experienced widespread production freeze-offs which resulted in significant force majeure called on downstream supply transactions. Enbridge Gas received notices of force majeure impacting over 230 TJ of supply deliveries contracted to flow to Dawn. Enbridge Gas was able to maintain service to its customers amid the lost supply using significant withdrawals from its storage at Dawn and Tecumseh.

On December 24, 2022, a single-day record of 6.5 PJ was withdrawn from storage at Dawn. In addition to allowing Enbridge Gas to serve its customers, these storage withdrawals also provided stability in the price of gas at Dawn during the storm. Dawn prices increased approximately \$0.50 US/Dth through the week leading up to the holiday storm whereas nearby market hubs in the U.S. Midwest and Northeast increased by \$10 - \$25 US/Dth.

- b) Table1, provided at Attachment 1, includes all major unplanned outages in compressor units at Dawn and Corunna for the period 2016 to 2022. The major unplanned outages refer to any failure resulting in more than 5 days downtime, including breakdown events, corrective maintenance activities, and capital projects initiated as a result of major failures.

Please see Attachment 2 from the Dawn to Corunna Replacement Project¹ which highlights Corunna downtime from 2016 to 2021.

¹ EB-2022-0086.

Table 1: Unplanned Outages at Dawn Corunna

Line No.	Plant	Plant Name	Work Type	Work Description	Title	Failure date	Duration (days)

Unit	Title	Description	Start date	End date	Duration (days)
K701	CM - Crank Misalignment due to Foundation Damage	during Oil Change, checked web deflections and bearing clearances, found high web deflection on #5 power, found clearance under #1 main bearing. Main bearing work completed. *Unit left unavailable with option to operate as last-on due to foundation damage. The damaged block was left unrepaired in anticipation of the upcoming renewal project.	12/06/2018	Ongoing	1268* As of May 26, 2022
K701	CM - Compressor Cylinder Leak	Replaced o-ring on valve cap to repair leak	04/01/2019	05/06/2019	36
K701	CM - Gate Valve Leak	Upon inspection we found that the packing gland is cracked and needs to be replaced or repaired	01/13/2021	06/15/2021	154
K702	CM - Glycol Leak	pump seal was leaking removed old pump and installed re-built water pump from the warehouse	06/22/2018	06/26/2018	5
K702	BR - Water Pump Failure	K702 has a knock coming from the water pump, a bushing was wore out on the water pump drive gear shaft causing the gears to not mesh properly, removed the gear case and water pump, had TREL repair the damaged drive gear and make new bronze bushings, re-assembled the gear case using a used spare shaft from a gear case we had sitting in the warehouse, installed a new rebuilt water pump from inventory, installed hardened cotter pins in the water pump drive chain	09/22/2020	10/05/2020	14
K702	BR - Engine Failure	A large knocking noise started and emergency stop was used	09/13/2021	01/18/2022	128
K702	BR - Compressor Cylinder Overhaul		03/16/2022	05/26/2022	72
K702	CM - Comp Cylinder Valve Leak	Suction scrubber door/comp cyl 1 valve cap leaking, installed new seal on door waiting to be pressured up, new O-ring was installed on valve cap	05/06/2022	05/26/2022	21
K703	BR - Cracked Crown	Large oil leak out of front on engine possible crown issue, repaired K703 Cracked Crowns	07/25/2016	10/19/2016	87
K703	CM - Crankshaft Repair	disassembled top and bottom end of engine so that the crankshaft was bare, removed flywheel, loosened timing chain, removed all but three main bearings, installed all new (Dresser-Rand) main bearings, found that the top half of the bearing had lots of crush and the bottom half had very little, #11 main bearing is not an elliptical bearing, re-recorded web deflections, checked bearing clearances, installed end seal and baffle plate, installed flywheel and torqued to 1800ft/lbs, rechecked bearing clearances and web deflections on #10 and #11 main (good), installed compressor rods with old bearings, installed all power rods with old bearings, reassembled top end of engine and tightened timing chain, bump checked compressor and power rods (good), checked crosshead pin clearances (good), when unit was test run we heard a loud ticking sounds from the flywheel end, we found that the baffle plate for the crank end seal had been damaged when the flywheel was being torqued, we removed the flywheel again and replaced the baffle plate, test ran the unit again and the noise was gone	05/01/2017	08/17/2017	109
K703	BR - Power Cylinder Overhaul	Disassembled #7 power cylinder and inspected all parts, found that the piston crown was cracked in two places, inspected all other parts and found no issues, deglazed power cylinder, checked piston cutout for proper alignment (good), installed new piston with new rings and installed cylinder with new o-ring, cleaned and installed used head with a new copper gasket, re-assembled all top end auxiliary parts with new gaskets, installed rocker arm with new lifters and set tappets, cleaned out that bay of the crankcase and installed doors with new gaskets, boroscoped PCC pot after water was installed (good)	06/22/2018	06/26/2018	5
K703	CM - Gas Cooler Motor Failure	K703 #2 gas cooler fan wont run, motor has been replaced	01/05/2021	01/09/2021	5
K704	CM - Repair identified leak	#N/A	01/24/2019	03/20/2019	56
K704	CM - Suction Valve Very Noisy - Replace Motor	Preoper motor arrived and installed on valve actuator, valve tested and put back into service	06/12/2019	07/05/2019	24
K705	CP -K705 Engine Block Replacement		09/05/2016	01/20/2017	138
K705	CM - Aux Oil Pump Failure	Rebuilt the gear case with all new bearing and seals	04/21/2017	05/11/2017	21
K705	BR - Cylinder Overhaul	Engine was running with pre-ignition in #7 cylinder, pressure tested cylinder and found no compression, air was leaking from combustion chamber down into the crankcase	07/21/2017	07/26/2017	6
K705	BR - Suction Scrubber Repairs	During the scrubber inspection and filter replacement it was noticed one of the filter supports near the top of the vessel was broken.	04/25/2018	05/18/2018	24
K705	CM - Bearing Replacement	Installed new MW main bearings in unit, C35used all new main bearing shims	04/30/2018	05/31/2018	32
K705	CM - Inspect Crankshaft	This unit has a damaged crankshaft, in the summer of 2017 we had some issues with this unit	06/01/2018	07/18/2018	48
K705	CM - Discharge Valve Gas Leak	Repair identified leak, the valves mentioned are on the greasing list for 2019	01/24/2019	06/10/2019	138
K705	CP - Crank Repair (Replacement)	This Project Work Order was initially created as O&M spend. It has since been risk ranked and approved for Capital Spend	07/11/2018	09/18/2019	435
K705	CP - Re-assemble K705 engine		06/26/2019	09/06/2019	73
K705	CP - Repair Cam Carrier and Power Cylinder	opened filter vessel and removed filters, the 2 magnets that were in the vessel had a lot of metal filings in them, cleaned filter pot, checked clean side to make sure no filings were there (it looked good), installed new oil filters, installed magnets in every filter, re-used old door o-ring, also drained oil from the bottom leg of piping and the oil cooler	10/21/2019	01/01/2020	73
K705	CM - Suction Scrubber Door Leak	Cleaned seal and closed back up waiting to be pressured up to check for leaks	04/27/2022	05/01/2022	5
K706	CM - Liner Inspection	Removed liner and inspected for cavitation along the top o-ring groove, found some cavitation but nothing too serious (see pictures attached), cleaned up the liner and holder and installed new copper gasket and o-rings, re-assembled the liner 90° from the original position in the holder	04/01/2016	04/25/2016	25
K706	BR - Cam Drive Hub Replacement	Problem: the unit would not roll over during the start sequence, Robertshaw valve was rebuilt, both seals on the air starter and cam reset housing were inspected, no change	01/27/2017	02/03/2017	8
K706	CP - Engine Block Foundation Replacement		07/04/2017	01/22/2018	203
K706	CM - Aux Water Pump Rebuild	Sandarin rebuilt the pump and motor, we installed the pump with new gaskets, studs and nuts	01/30/2018	02/27/2018	29
K706	CM/CP - Cam Upgrade and Laser Alignment	PCG laser aligned cam carriers on both sides of the engine, Cam carriers were shimmed and re-dowled as needed, Checked drive gears on both sides for contact and back lash and adjusted the end cover to set correctly, installed the upgrader cams and torqued all bolts, Wire tied the dowels on the drive ends, installed push rods and rocker arms and set tappets, Completed the timing of the cams	03/08/2018	06/26/2018	111
K706	CM - Engine Water Pump Rebuild	Engine water pump is installed	03/26/2018	04/03/2018	9
K707	CM - Cracked Piping	Cracked nipple where vent piping threads into bypass, work completed. As building to be completed in the coming weeks	08/23/2016	08/30/2016	8
K707	CM - Replaced Gas Packing	replaced gas packing and oil packing on all cylinders, found that the nose cone gasket was leaking on #4 cylinder, replaced the packing case on #4 cylinder because we couldn't set the new nose cone gasket	01/21/2019	01/25/2019	5
K707	CP - Engine Block Foundation Replacement		10/13/2020	04/22/2021	192
K707	CM - Gas Cooler Motor Failure	K703 #2 gas cooler fan wont run, motor has been replaced	07/08/2020	01/12/2021	189
K707	BR - Liner Replacement	during chain PM's we found moisture in the crankcase that was causing a lot of rusting internally, after investigating we found that the liners were leaking glycol from around the o-ring area, oil change to remove contaminated oil was completed under a different WO, replaced water pump chain under different WO, disassembled top end, installed new DR liners into refurbished Air Correct holders using D-R O-rings that came in the liner crates, cleaned up pistons and installed new rings, checked ring clearances in liner and on piston (good), re-assembled top end, cleaned and re-used the same heads, used DR gasket kits to install new gaskets everywhere on the top end, installed water and gas piping with new o-rings, pressure tested glycol system and found no major leaks, had operations put water in the unit and turn the warm up's on, this was the first time the new plant glycol was going in K707 engine, first we noticed some glycol leaking between the head and liner externally on some of the cylinders, after letting the engine sit a few days we started noticing glycol leaking internally around the liners the same as it was before, removed #6 cylinder to investigate, took liner and holder to TREL to verify measurement and machine work, found that the bronze o-ring area wasn't square to the top head gasket surface, suspected that the liners weren't sealing properly when the head was being torqued down because faces weren't square, the original holders were taken to Goodman Brown to be reconditioned, they squared up the holders and refinished the bronze sealing area, we tore down the top end again and installed the new refinished holders with the same new DR liners, installed all new O-rings and gaskets, had operations fill unit with water, found that all liners were still leaking internally past the o-ring sealing area, removed #8 cylinder to investigate because it was leaking the worse, Jim took the liner and holder to Goodman Brown with Tony Tebo, they found that the finish on the bronze was not to spec and was too porous, suspected that glycol was able to leak past the O-rings because of an improper finish, Goodman Brown refinished the bronze area again using an older method used previously to get the finish within spec, installed the new refinished holder back in #8 cylinder with the DR liner using all new O-rings and gasket kit, operations put water back in unit and we found that glycol was still leaking internally from the o-ring area, removed #8 cylinder again to investigate, decided that there was maybe an issue with the hardness of the DR liner o-rings, ordered 90 durometer Viton O-rings and installed them on the #8 liner, re-installed #8 cylinder and checked for leaks internally, found no glycol leaking, decided that we should do another cylinder to verify this would fix the problem, removed #6 cylinder and installed 90 durometer Viton O-rings on the liner, assembled cylinder and checked for leaks, cylinder was not leaking, disassembled the rest of the top end and installed new 90 durometer viton O-rings on all liners, used all new gaskets, filled unit with water and found no leaks internally, we still have a couple cylinders leaking between the head and the holder externally but they seal up with the warm ups on, still investigating why that is. Conclusion: all holders are refinished from Goodman Brown using the older method of bronzing that produced the proper finish, 90 durometer Viton O-rings from the RPS Machine were used on all liners and most holders, #8 cylinder does not have a 90 durometer o-ring around the outside of the holder - we can watch it for oil leaks and see if it makes a difference, K707 foundation project is starting now and we will test run unit after it is	01/15/2020	10/08/2020	268
K708	CP - Engine Block Foundation Replacement		10/09/2019	04/25/2020	200
K708	CM - Water Pump Chain Replacement	new water pump chain was installed due to older one being stretched and could not be adjusted to proper tension, hardened cotter pins were installed, chain tension was set	10/11/2019	04/14/2020	187
K709	BR - Jacket Water Fan Motor Failure	Installed new motor, installed new overload switch, change wiring in starter to reflect 2 winding motor	04/18/2016	04/27/2016	10
K709	CM - Replace exhaust cam rollers #6, #7 and #9 cylinders	when changing the cam rollers on#6,7,9 exhaust we noticed some wear on the exhaust cam lobes so we replaced all three cams and upgraded the lock wires on the cam bolts to Nord-Loc washers	01/16/2017	01/20/2017	5
K709	CM - Compressor Rod Bearing Replacement	Replaced compressor Rod Bearings	09/10/2018	09/25/2018	16
K709	BR - Power Cylinder Cold	Replaced plug and check, corrected the problem	01/09/2020	01/13/2020	5
K709	CM - Outer End West Unloader Leaking	After unit was pressured up I checked for leaks and found none	12/11/2020	12/16/2020	6
K709	CM - Repair Leak on Recovery Gas Isolation Valve	inspected leak found stem of valve leaking and needs replaced	11/26/2020	01/01/2021	37
K710	CM - Replace Bearings on #1 Gas Cooler Shaft	Installed New Bearings on Cooler Shaft	05/28/2020	06/09/2020	13
K710	CM - Bearing Replacement and Adjustments	Bearing Repair Work Complete	07/12/2021	08/16/2021	36
K711	CM - Main Bearing Replacement	Removed DR main bearings because they were pulling away from the saddle and we had clearance behind the bearings, installed new Washington Iron Works main bearings, #11 main bearing had an elliptical bearing in it, all bearing, shim sizes and bearing clearances were measured and recorded (attached), installed oil passage ways and wired bolts, measured and recorded crank thrust (attached), during bearing checks we found that #1 and #8 main had .0018quot; clearance under the crank, looked up our last clearance checks from 2015 and found that clearance under #1 and #8 were there before, also found during clearance checks that a couple bearings had some clearance between the frame and the bearing, it was only in a spot about an inch down from the split line and not in very deep, probable due to some fretting on the saddle, not a bearing issue	12/04/2017	12/19/2017	16
K711	CM - Replace #10 Power Rod Bearing	During our oil change we found that #10 power rod bearing was cracked,when we removed the bearing we found that the bearing was smashed to pieces on the rod half, we disassembled #10 cylinder and removed the power rod, we measured the bore for the power rod and found that it was only .001 out of round (good),we removed the bearing from #5 power rod and found that it was showing early signs of failure,the oil hole on the rod half was starting to extrude into the oil passageway in the rod,we installed a new DR bearing in #5 power rod,we believe the power rod bearing issues are related to the issues we have had with the DR main bearings (issues with snap, crush and possibly material),we have ordered a set of Washington Iron works power and compressor rod bearings and are planning to change all bearings out later,installed new DR bearing in #10,deglazed cylinder liner and installed new piston rings on piston and assembled,installed new re-built cylinder head ,bump checked both #10 and #5 power rods (#10: .0128quot; / #5: .0125),installed water and checked for leaks (good),installed oil and test ran,checked bearing temperatures at the different intervals and everything looked normal	11/30/2017	01/05/2018	37
K711	CM - Power and Compressor Rod Bearing Upgrade	We are upgrading all of our bearings to Washington Iron Works due to material issues with the Terra Corp bearings, the main bearings have already been changed out to WIW, replaced all of the power rod bearings,minimal cleaning was required because the bearings had just been replaced a few years ago ,the only abnormal thing that we found was some pitting on the bearings where the oil relief groove is cut into it,the pitting got worse as we moved towards the flywheel end,at the flywheel end some were bad enough that it had eaten right through to the back side of the bearing ,pictures were taken and sent to Tony Tebo at D-R for input,replaced all compressor rod bearings ,no issues were found ,torqued all bolts and installed new cotter pins , cleaned out the crankcase and installed doors with new gaskets,monitored bearing temps during test run ,all temperatures looked good	07/23/2018	07/27/2018	5
K711	CM - Oil leaking from packing in dog house 25 gal/day	Inspected and will repair when unit is available	01/15/2020	01/27/2020	13

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 1, Attachment 6

Preamble:

On pages 68-69, the study estimates: *Using the ICF assessment of the likely cost of deliverability associated with high deliverability storage ICF estimated an initial cost of delivered services at \$3.72/GJ/Day for 10 days of delivered services.*

The study goes on estimating the incremental storage value in the remaining pages.

Question(s):

Please provide the complete derivation of the estimated cost including the sources of data and assumptions made.

- a) Please ensure the derivation includes stated \$0.41/GJ and the formula in footnote 35.
- b) Please provide Appendix D referred to later on the same page.
- c) In comparing the information in footnote 36 (the Storage Revenue Report) and footnote 37 (the Storage Parameter Report), it is clear there is no observable linkage between the revenue generated and the parameters associated with the specific contract.
 - i. How did ICF make that linkage for the purpose of the analysis?
 - ii. Would the source of that linkage be available to those using those sources as accessed on EGI's website?
 - 1) If not, why not?
 - iii. While these reports are available through the hyperlinks provided by the study, does EGI provide access to historic indices of customers with this data?
 - 1) If not, why not?
- d) The Storage Parameter Report provides contract identifiers with acronyms LST and LTP.
 - i. Please distinguish these type of contracts

- ii. Are there any LTP contracts that provide proportional deliverability to the current balance in storage?
 - 1) If so, how is the Maximum Firm Daily Withdrawal reported for those customers.
 - 2) How were the unit cost/deliverability used in the ICF analysis for those customers?
- e) Please explain the absence of any storage contracts with deliverability between 1.2% and 1.8% in Exhibit E 1 that are evident in the Storage Parameter Report that is referenced in footnote 37.
 - i. Please provide an updated graph of Exhibit E
- f) Please provide a full derivation of the incremental storage value including source of data and assumptions made.

Response:

- a-f) This evidence will be addressed in Phase 2 of the proceeding as noted in Enbridge Gas's February 1, 2023 letter.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 2, pg. 1

Preamble:

EGI evidence states: *The reference price is used to price sales service commodity, gas in storage (a component of rate base), unaccounted for gas (UFG), company use, and compressor fuel, as part of the revenue requirement for the 2024 Test Year. As these costs have been consolidated for the amalgamated utility, a common reference price is required to support the 2024 Test Year Forecast as part of this Application.*

Question(s):

Where has EGI evidenced, using the current Board-approved methodologies for the calculation of the 2024 Test Year Forecast, to allow comparison with the new proposal?

a) If not provided in evidence, please provide.

Response:

The comparison using current OEB-approved methodologies is not provided in evidence.

a) Please see Table 1. Enbridge Gas estimates that the proposed harmonized weighted average reference price will reduce the revenue requirement for unaccounted for gas (UFG), company use, and compressor fuel by \$3.7 million as compared to the current OEB-approved reference prices. This comparison assumes that the gas costs for current OEB-approved reference prices are based on a PGVA reference price of \$5.996/GJ for the EGD rate zone and a Dawn reference price of \$5.269/GJ for the Union rate zones¹. As there is one combined budget for UFG, company use, and compressor fuel, the 2024 Cost Allocation Study was used to

¹ Based on the April 2022 QRAM (EB-2022-0089).

allocate the volumes to each rate zone to derive impacts for the purposes of this response.

Table 1
Proposed vs OEB-Approved Gas Cost Recovery

Line No.	Particulars (\$millions)	Proposed (a)	OEB-Approved (b)	Difference (c) = (a - b)
1	UFG	42.9	45.2	(2.3)
2	Company Use	3.0	3.2	(0.2)
3	Compressor Fuel	24.1	25.4	(1.3)
4	Total (1)	70.0	73.7	(3.7)

Note:

(1) Total gas cost recovery is net of customer supplied fuel costs.

The 2024 estimated allowance for working capital (rate base) relating to gas in storage using the current OEB-approved reference prices would be approximately \$659.8 million, compared to the 2024 Test Year Forecast of \$648.4 million, as provided at Exhibit 2, Tab 3, Schedule 1. The lower rate base would result in a lower revenue requirement of approximately \$0.7 million. This impact assumes that the gas in storage balance is separated into EGD and Union rate zones, and gas in storage amounts for the two rate zones are calculated by multiplying the gas in storage volumes to the respective reference prices as mentioned above.

Enbridge Gas is also proposing to use the gas supply reference price to set gas supply commodity charges. There are no impacts to amounts that customers will pay with this proposal, as all forecast gas supply portfolio costs will continue to be passed on to customers without markup, either through gas supply charges and/or gas supply price adjustments.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 2, pg. 1-6, 13 and Ex. 4, Tab 2, Schedule 1, Attachments 1-3
& EB-2022-0286 EGI QRAM2023Q1, FRPO_SUB_EGI_QRAM 2023Q1_20221214

Preamble:

Understanding that EGI planned to respond to the Board's direction to advance a harmonization **proposal** (emphasis added), FRPO attempted to understand how EGD was allocating some transportation to load balancing costs in the 2022 QRAMs. Our inquiry stemmed from the rising costs of load balancing as identified in the applications. Having not received clarifications requested, we committed that we would pursue understanding in this proceeding (QRAM reference above).

Given that there is limited information available on gas supply costs allocated under current Board-approved policies, we would like to understand the load balancing allocation process currently in place that eventually flows into rates and deferral accounts such as the PGVA.

Question(s):

Using the November 1, 2022 Upstream Transport Contract Summary in Schedule 1, Attachment 3 reference:

- a) In an Excel spreadsheet, for each line of transportation, please provide the current allocation of the demand contract quantity to:
- i. Gas Supply Commodity
 - ii. Gas Supply Transportation
 - iii. Load Balancing
 - iv. Other?

Indicating to which existing Rate Zones the allocation is being made.

- b) For each Rate Zone, please provide the rationale, or at least the guiding principles, that provide the allocation methodology.

- c) Please explain how this previously applied rationale or guiding principles would change in the new proposal.

Response:

a-b) The information requested cannot be provided in the simplistic format suggested. The upstream transportation contracts held by Enbridge Gas on November 1, 2022, listed in Exhibit 4, Tab 2, Schedule 1, Attachment 3, are different than those that existed at the time that each of the former EGD and Union based its Gas Supply Plan in rates. Detailed classification of gas costs is completed only when the Gas Supply Plan is set into rates. Information describing the current rate design methods for gas transportation costs is provided at Exhibit 8, Tab 2, Schedule 2, pages 9 to 11.

Variances from the amounts set into rates are captured in deferral and variance accounts and disposed of through the applicable QRAM proceedings. The allocation of these variances is consistent with long-standing OEB-approved QRAM methodologies that differ between the EGD and Union rate zones.

EGD Rate Zone

The most recent EGD Gas Supply Plan was set into rates in EGD's 2018 Rate Adjustment Application¹. The detailed classification of Gas Costs to Operations can be found in EGD's 2018 Rate Adjustment Application² and is provided at Attachment 1. Attachment 1, page 1 provides the classification of total gas costs from EGD's Gas Cost to Operations to each functional area of gas supply commodity (column 3), storage (columns 4 to 6), load balancing (columns 7 and 8), transportation (column 9) and distribution commodity (column 10). The total classified costs by component are shown on line 9.

The EGD rate zone cost allocation and rate design methodology for pricing its commodity, transportation and load balancing services has been in place since 2005. The methodology was reviewed with stakeholders most recently in the Ontario Landed Reference Price consultation and reported to the OEB in EGD's 2018 Rate Adjustment Application³.

The Company uses the Empress price inclusive of fuel as a reference price to cost its supply purchases. This can be seen in Attachment 1, page 1, columns 1 to 3.

¹ EB-2017-0086.

² EB-2017-0086, Exhibit G2, Tab 6, Schedule 2, pp.1-3.

³ EB-2017-0086, Exhibit H1, Tab 2, Schedule 2.

The cost of gas supply commodity is recovered from sales service customers through the Company's gas supply commodity charge.

Any price premium or discount for gas supplies purchased at other supply hubs relative to the Empress reference price are classified as transportation (i.e. deemed transportation costs) (column 9) and, in the case of delivered supplies, also to load balancing (columns 7 and 8). This can be seen at Attachment 1, page 1, line 1 under total purchases and receipts.

Attachment 1, page 1, line 2, column 9 provides transportation costs for services to transport gas from various market areas to Ontario and to each of the various delivery areas within Ontario. Attachment 1, page 2 provides the classification of transportation costs to load balancing and annual (transportation) by transportation path. The total costs of transportation on Attachment 1, page 1, line 9, column 9 reflects transportation charges that sales service and Western T-service customers pay, which are a function of the cost of upstream capacity (i.e. transportation tolls) to meet average day demands for sales service and Western T-Service, and deemed transportation costs as described above.

Load balancing costs (Attachment 1, page 1, columns 7 and 8) include the cost of third-party services (peaking) and discretionary supplies. Upstream transportation costs that are incurred for sales and direct purchase customers to meet demand above average day demand are also classified as load balancing. These costs are recovered in the load balancing rates for all bundled customers (sales and direct purchase).

The determination of the changes in gas costs through the QRAM process is a mechanistic approach where Enbridge Gas updates the gas cost prices for the current QRAM and compares the total costs with the previous QRAM. Any changes in gas cost are captured and reflected in the current QRAM application. Variances between actual and forecasted transportation costs are allocated as transportation costs. Any difference between the actual cost of delivered supplies and the approved Empress price is allocated as load balancing cost, as well as any variance in the actual cost of peaking services and the forecasted cost of peaking services. The remaining variances are allocated as commodity costs.

Union Rate Zones

The most recent Union Gas Supply Plan was set into rates in Union's 2018 Rates Application⁴. The update to 2018 rates was in accordance with Union's Dawn Reference Price Application⁵. The changes to gas supply transportation and storage

⁴ EB-2017-0087.

⁵ EB-2015-0181.

rates were based on a detailed cost allocation for the Union North West and Union North East rate zones. The detailed classification of transportation and storage costs from Union's Dawn Reference Price Application⁶ is provided at Attachment 2.

Since the Dawn Reference price represents a landed cost of gas at Dawn, all of the upstream transportation costs incurred by the Union South rate zone to bring gas supplies to Dawn are allocated as gas commodity costs. For the Union North rate zones, the cost of third-party transportation services contracted from either Dawn or Empress are used to meet a combination of the average day demand and peak demand over average demand. The average day demands are determined by calculating the proportion of average day demand to the total contracted firm transportation demand of each of the Union North East and Union North West rate zones. These transportation costs are recovered in gas supply transportation rates. The cost of third-party transportation services from either Dawn or Empress are used to meet peak demand over average day demand of each of the Union North East and Union North West rate zones and are classified as storage. These storage costs are recovered in gas supply storage rates (which are similar to the "load balancing" rates of the EGD rate zone).

Variances between the forecast gas costs used to set rates and actual gas costs are captured in deferral and variance accounts and disposed of in applicable QRAM applications. Variances related to transportation costs in the Union South rate zone are captured in the Union South PGVA and are disposed to customers through gas commodity price adjustments. Variances related to third-party transportation costs in the Union North rate zones are captured in the Union North East and Union North West Tolls and Fuel Variance Account and are disposed to customer through transportation price adjustments.

- c) The rationale in setting the gas supply transportation and load balancing rates has not changed and is used in Enbridge Gas's rate harmonization proposal for the combined rate zones. Please see Exhibit 7, Tab 1, Schedule 2, pages 7 to 9 for a description of the methodology used to classify gas supply costs, including gas transportation costs between transportation and load balancing. Please see response at Exhibit I.7.1-IGUA-75 for information on the functional allocation of upstream transportation costs in the 2024 Test Year.

⁶ EB-2015-0181, Exhibit A, Tab 2, Schedule 1, pp.1-2.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 2, pg. 1-6, 13 and Ex. 4, Tab 2, Schedule 1, Attachments 1-3
& EB-2022-0286 EGI QRAM2023Q1, FRPO_SUB_EGI_QRAM 2023Q1_20221214

Preamble:

On pg. 13, the evidence states: *In 2023, Enbridge Gas will also develop harmonized consolidated QRAM schedules to be filed in support of reference price changes as part of the January 1, 2024 QRAM Application.*

We have been challenged in the past to get transparency from the Union Gas QRAM ratemaking. We would like to understand it in comparison to the EGD Rate Zone examples provided in the Attachments.

Question(s):

Please provide comparable schedules to demonstrate the April 2022 QRAM ratemaking for Union South, Northwest and Northeast.

- a) Please confirm, that to achieve transparency, EGI will commit to providing QRAM schedules comparable to the EGD Rate Zone schedules, evolved for the 2024 rates, if the Board were to approve that approach.
 - i. Please explain and clarify.

Response:

Exhibit 4, Tab 2, Schedule 2, pages 4-6 provide an explanation of the current approved reference price methodologies for the EGD and Union rate zones. The April 2022 QRAM schedules for the EGD and Union rate zones are provided at Exhibit 4, Tab 2, Schedule 2, Attachments 1 and 2

The reference price methodology for the EGD rate zone is calculated based on the forecasted gas supply commodity costs, upstream transportation costs, and load balancing costs. The current approved reference price for the Union South rate zone and Union North East rate zone is the Dawn reference price, and the reference price for

Union North West rate zone is the Alberta Border reference price. Given that the Union rate zone reference prices are supply point specific, the detail as it relates to components of costs within the Union rate zone is not equivalent to what is required for the derivation of the reference price for the EGD rate zone.

- a) Enbridge Gas can commit to filing clear and transparent evidence to support the requested QRAM rate changes as part of the QRAM Application. Subject to OEB approval in this Application, Enbridge Gas will update Exhibit 4, Tab 2, Schedule 2, Attachment 3 as part of the final rate order in this Application for the January 2024 QRAM (or the next available QRAM at the time), depending on approval timing. Please see response at Exhibit I.6.1-SEC-205 and Exhibit I.9.1-SEC-221.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 3, pg. 2 & EB-2022-0133 Exhibit I.FRPO.5 , Attachment 1

Preamble:

EGL evidence states: *Enbridge Gas's proposed approach to determine design demand and its selection of design criteria aligns with the no failure approach in that it captures the coldest weather event experienced. It is a proven method used by Union and a majority of other utilities. It is an approach that is clear, simple, and repeatable...*

The design criteria and design demand processes need to consider not only the design conditions but also the impact on day-to-day system operations when evaluating potential changes in approach.

Question(s):

How does EGL test to ensure that their design philosophy does not lead to over-design?

- a) Please explain using the Dawn-Parkway system as an example.
- b) Please file the most recent system verification for the Dawn-Parkway system.
- c) Please explain fully how day-to-day system operations are considered in the design criteria.

Response:

- a) Enbridge Gas uses the following philosophy to mitigate over design of the Dawn Parkway System.

Customer demands are developed on an annual cycle as described in the design day demand process at Exhibit 4, Tab 2, Schedule 3, paragraphs 51 to 57. This analysis uses the previous year's actual measured winter data which ensures the design day demand is as up to date as possible and contains the most recently

observed energy transition changes and the forecast includes forward impacts of energy transition and customer intelligence.

The HDDw chosen to develop the design day demands is the coldest observed since 1979. This date is more recent than the previous used date of 1953. Using the coldest observed HDDw on record mitigates overbuilding as this condition has been observed.

The pipeline capacity of the Dawn Parkway System is also verified using actual flow rates and field measurements which are then compared to Enbridge Gas's hydraulic models of the system. This verification ensures the hydraulic model results are reliable. Please see part b) for a copy of this verification.

The solutions required to reliably serve customer demand are identified and placed into the asset management plan. During the annual planning cycle these solutions are re-evaluated and delayed when possible. During leave to construct (LTC) applications a robust set of alternatives is presented which include supply side IRPA's to reduce facilities where possible. It is recognized that a facility built in the short term may have excess capacity in the first few years as it is required to be built from valve site to valve site.

- b) Please see Attachment 1.
- c) The hydraulic modelling for day-to-day operational support requires the ability to adjust the customer demand for the weather conditions that will occur during the time of the work.

Hydraulic modelling is required for various activities including pipeline outages during construction or emergency response, system changes required to support in-line inspection tool runs and contingency planning. These activities need to be scheduled during times of year to avoid or minimize disruption to customers and require customized set up to maintain pressure above the constraint pressures and to maintain velocity within the range required by the inspection tools.

The design day and design hour process use the daily and hourly customer measurement data to complete a linear regression analysis which can predict the customer demand at any HDDw. This data is input into the hydraulic models to simulate any weather condition to be able to complete the work as described above. The analysis can determine and adjust demand for various types of customers up to each customer individually.

For further information and an example, please see Exhibit 4, Tab 2, Schedule 3, pages 26 and 27, Figures 2 to 5.

Summary of Dawn to Parkway Model Verification Study - 2022

January 4th, 2023

Introduction

A verification study of the Dawn to Parkway transmission model was performed to validate the model. The purpose of the study is to compare observed pressure and flow rate recorded in the field to the model's simulated results. This study compares actual pressure and flow rates recorded in the field to results from the hydraulic model to define percentage of pressure difference. The model is tuned by adjusting pipeline efficiency to minimize the pressure difference between the field data and modelled results.

Weather

To perform the verification, a series of cold winter days were chosen for comparison. The analysis period of January 27th, 2022, to January 30th, 2022, was chosen. This period of days had the highest flow into the Dawn to Parkway System (measured from the Dawn Cuthbert Measurement Station) for the winter of 2021/2022.

Model Segmentation

The verification covers the NPS 26, NPS 34, NPS 42 and NPS 48 transmission lines between the Dawn Cuthbert Measurement Station and the Parkway Compressor Station. To simplify modeling, the model was split into the sections between Dawn to Lobo, Lobo to Bright and Bright to Parkway. The compressor stations of Lobo and Bright act as delineation points where the model can easily be divided without impacting results. Appropriate pressure and flow profiles were loaded to align each model with the same analysis period.

Analysis Type

The model was run using the Unsteady State analysis tool for 96 hours along the NPS 26, NPS 34, NPS 42 and NPS 48. The model flow data was first configured to match actual flows from the analysis period. One pressure end point was also configured to match actuals. The model was then run and the hourly pressure results at each measurement point in the Synergi model was compared to the pressures recorded in the field.

Data

For each day, the actual hourly flow and pressure data at the telemetered points along the system was extracted from the Enterprise Data Warehouse. Using this data, volumetric flow profiles totalling 96 hours were created for each demand point and the source pressure node.

Volumetric Data

The volumetric flow SCADA data was collected from the WEBI GMDM program and flow profiles were created based upon actual data to upload into the Synergi 4.9.3 model. The model results were captured after running the model in USM and compared to the actual collected flow data. Figures 1-3 below shows the total flow profile over the 96-hour period used within the verification for each of the three major segments (Dawn to Lobo, Lobo to Bright and Bright to Parkway). The modeled and measured flows align very closely in each case since the model flow profile is based on actuals.

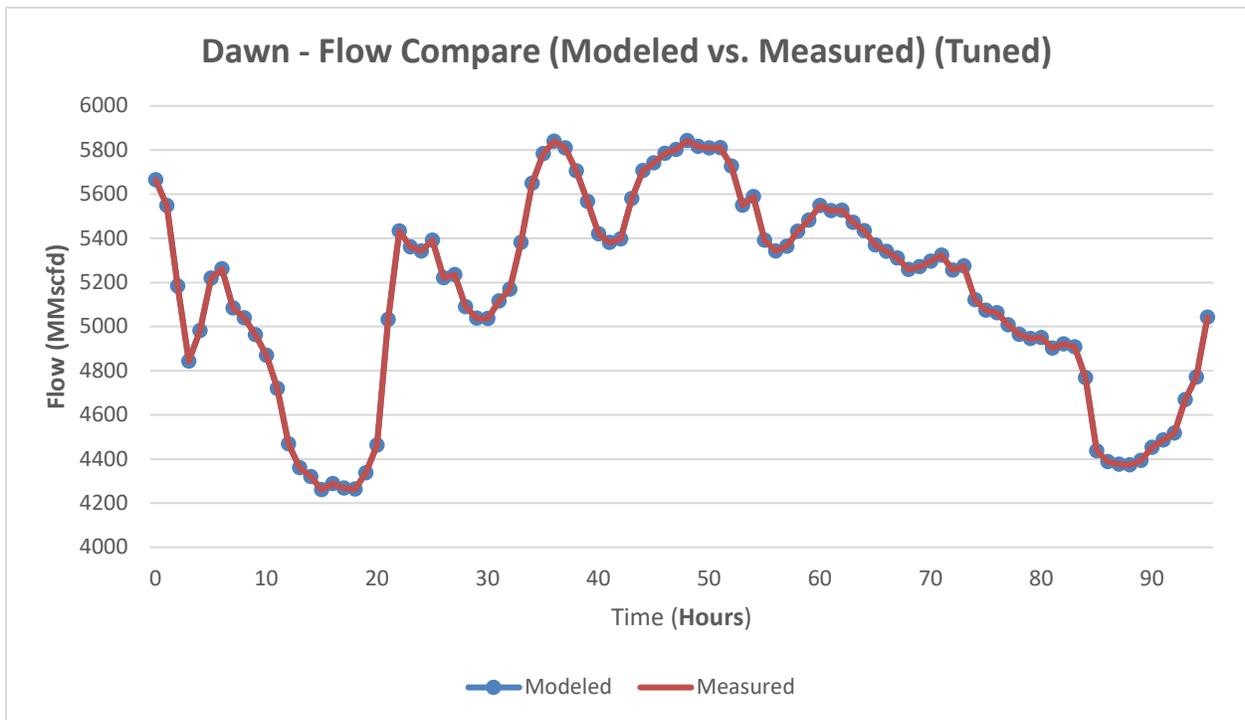

Figure 1: Dawn Flow Compare

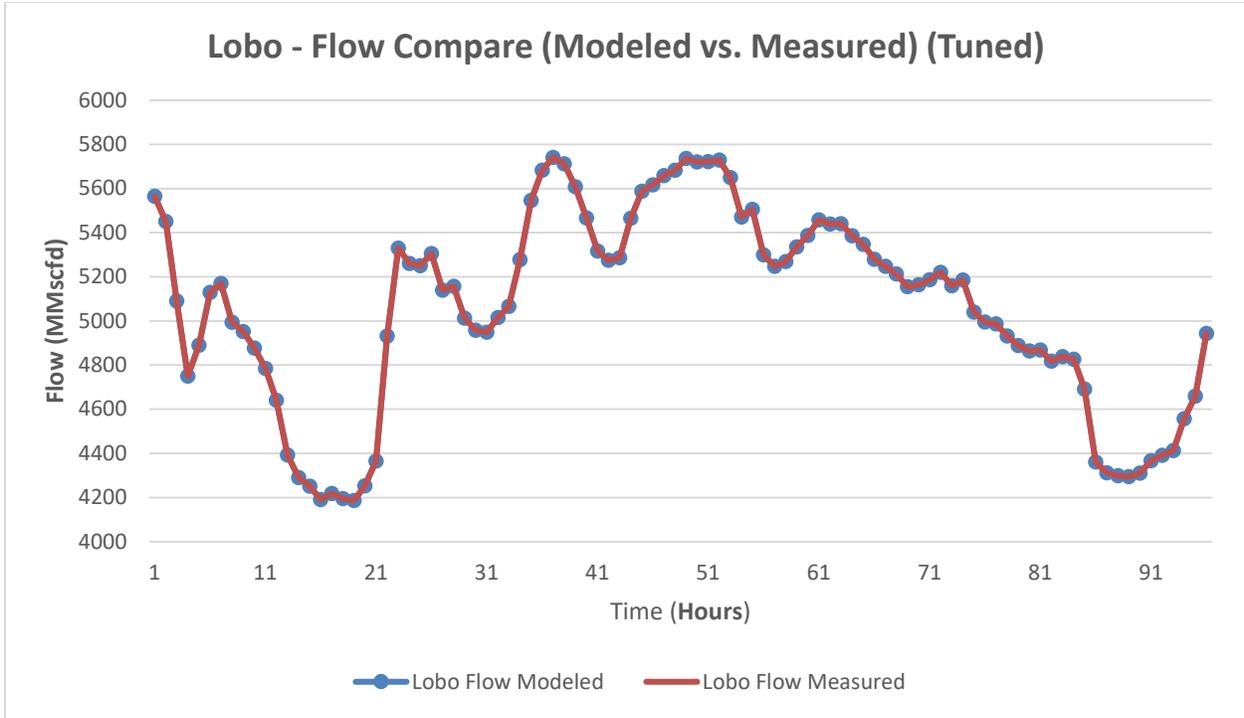

Figure 2: Lobo Flow Compare

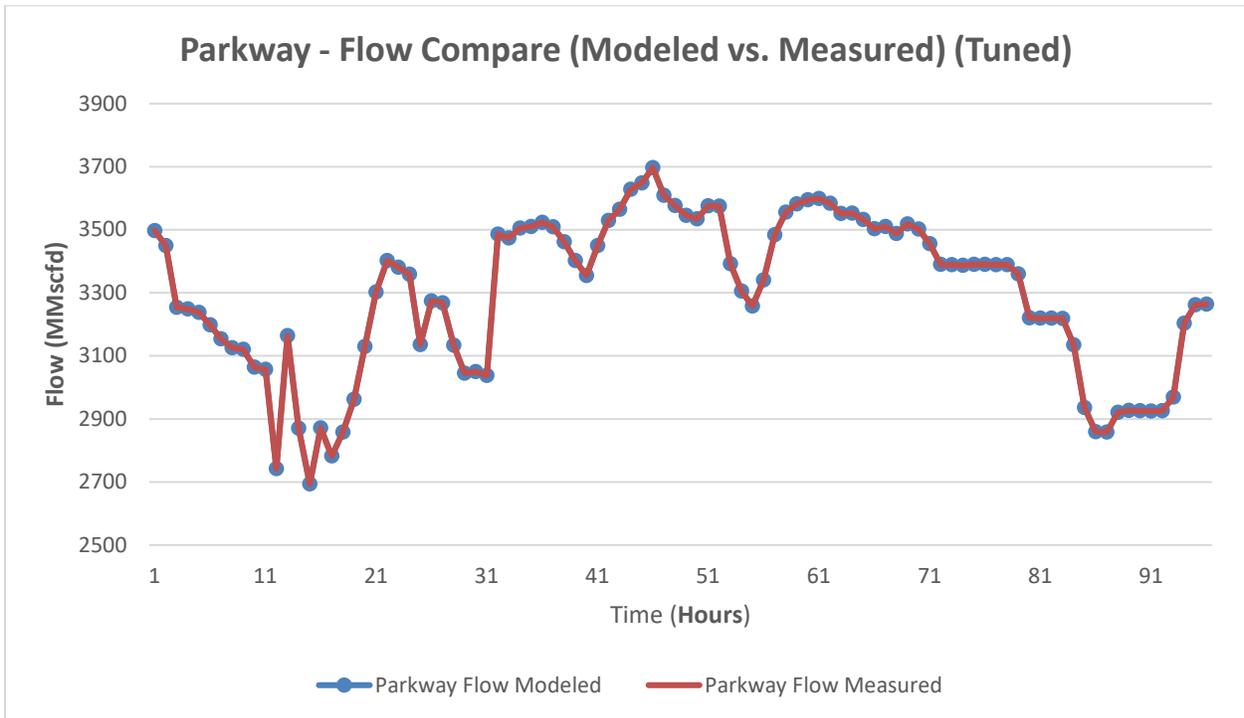

Figure 3: Parkway Flow Compare

Pressure Data

Dawn to Lobo

The first segment verified was the 4 lines between the Dawn Cuthbert Measurement Station to the Lobo Compressor Station. Pressures were compared to actual measurement at Cuthbert and three other intermediate take-offs with pressure measurement; Enniskillen, Brooke and Strathroy. Flow profiles were defined at Dawn and all other demand points active for the analysis period. A corresponding pressure profile of actuals was defined at the Lobo Compressor Station. 96 hours of modeled results were exported and compared to actuals. Pipeline efficiencies in the model were tuned to minimize the absolute pressure differential between field measurements and modeled results. A 0.1% absolute average difference over the 96 hours was used as a target to determine the required pipeline efficiency.

Table 1 and Figures 4-8 demonstrate significant changes to pipeline efficiency were required to align modeled results to measured actuals. This has prompted additional analysis and ongoing investigation. Additional information is provided in the Results and Impacts section of this report. Figure 7 shows the best alignment since Strathroy is the take-off closest to where the pressure profile is defined at Lobo. Figure 8 confirms that the pressure profile defined at Lobo based on actuals matches what is being produced when simulated.

<u>Section</u>	<u>Base Pipeline Efficiency</u>	<u>Absolute Average Pressure Difference (Base) (%)</u>	<u>Tuned Pipeline Efficiency</u>	<u>Absolute Average Pressure Difference (Tuned) (%)</u>
Dawn to Enniskillen	0.99	2.2%	0.83	0.1%
Enniskillen to Brooke	0.99	1.1%	0.91	0.0%
Brooke to Strathroy	0.99	0.8%	0.91	0.1%
Strathroy to Lobo	0.99	0.4%	0.95	0.0%

Table 1: Dawn to Lobo Efficiencies and Pressure Difference (Original vs. Tuned)

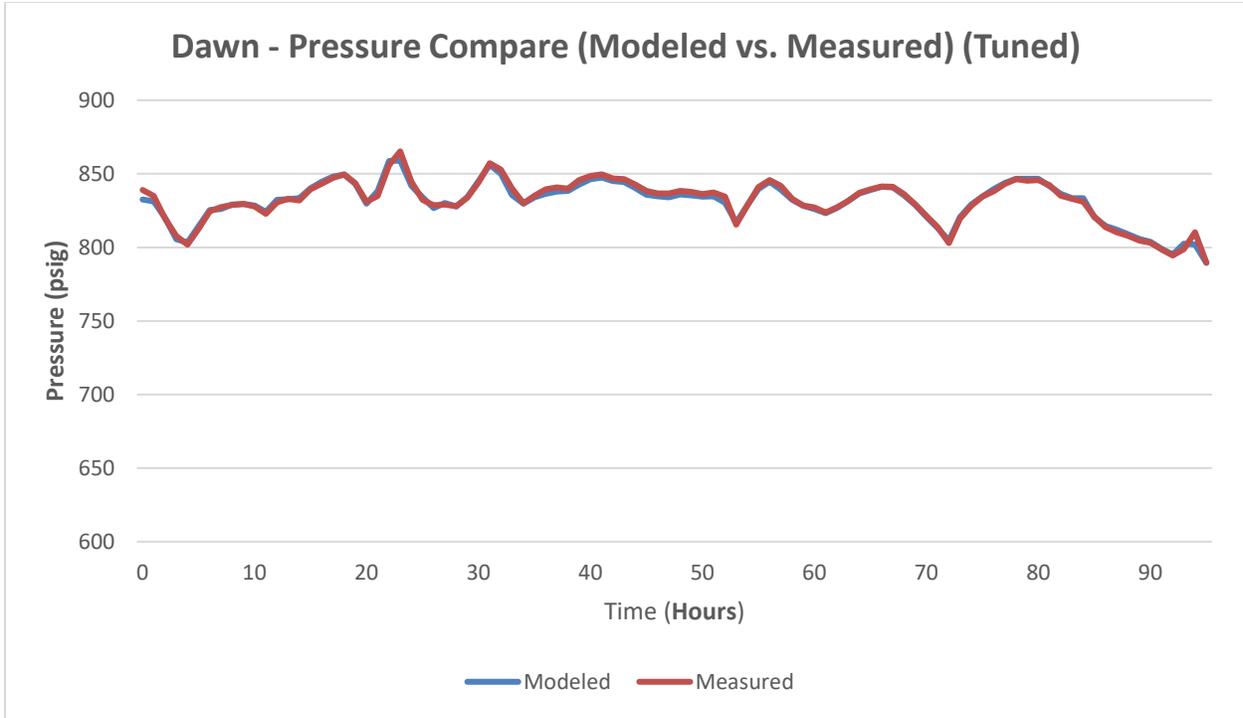

Figure 4: Dawn Pressure Compare

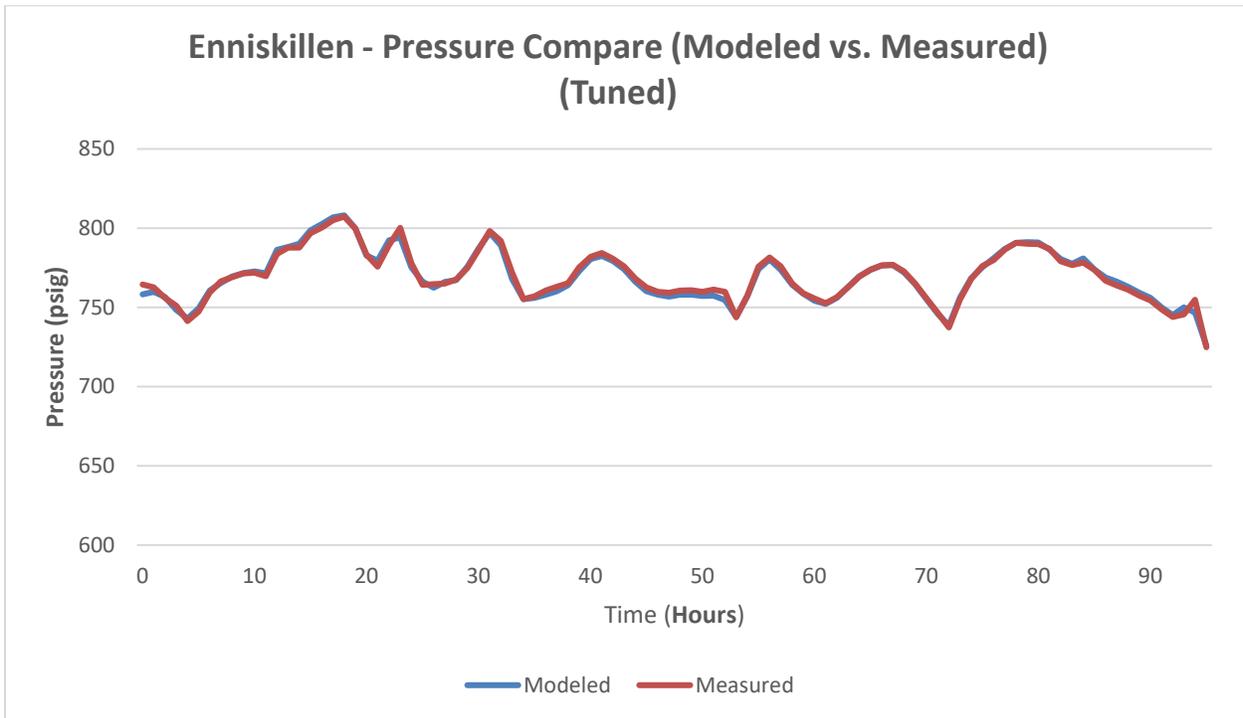

Figure 5: Enniskillen Pressure Compare

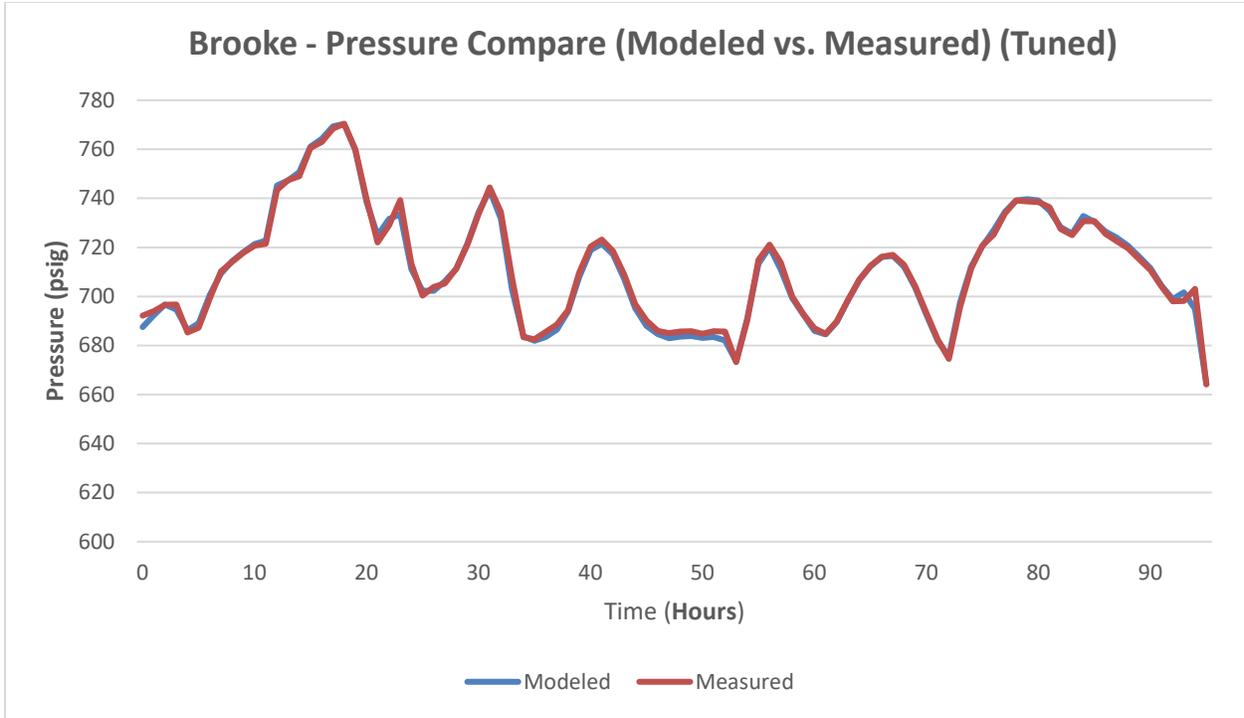

Figure 6: Brooke Pressure Compare

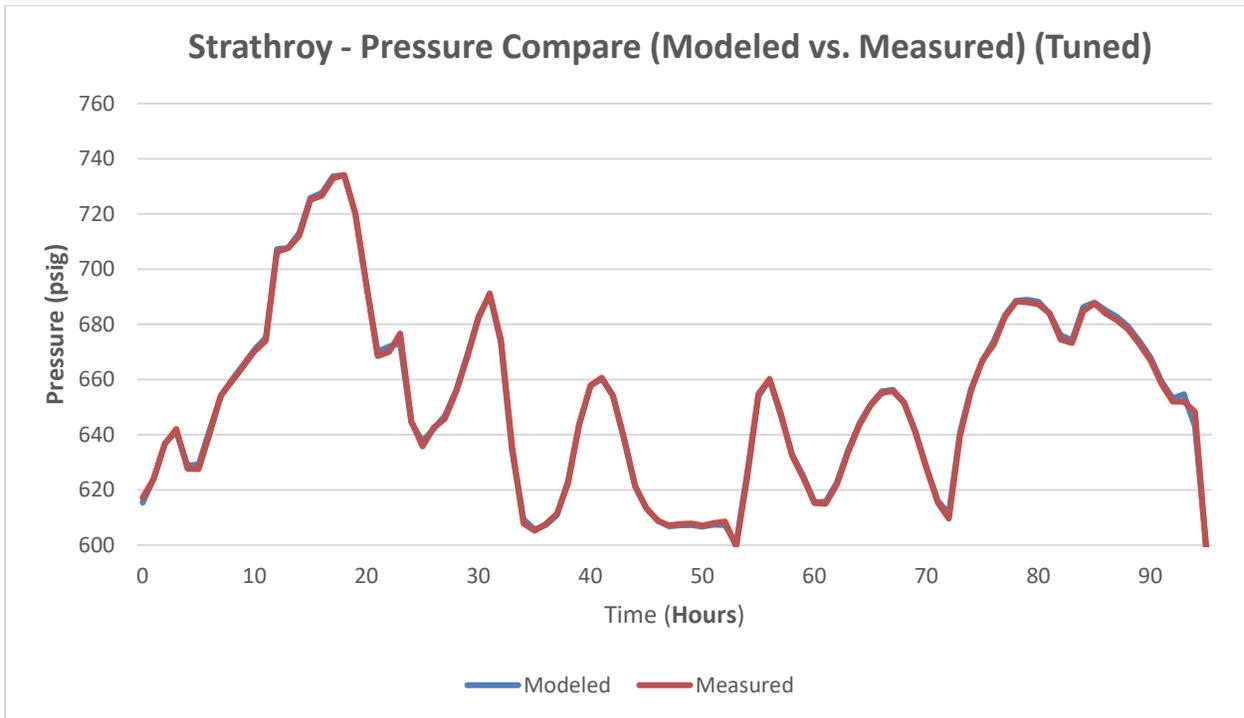

Figure 7: Strathroy Pressure Compare

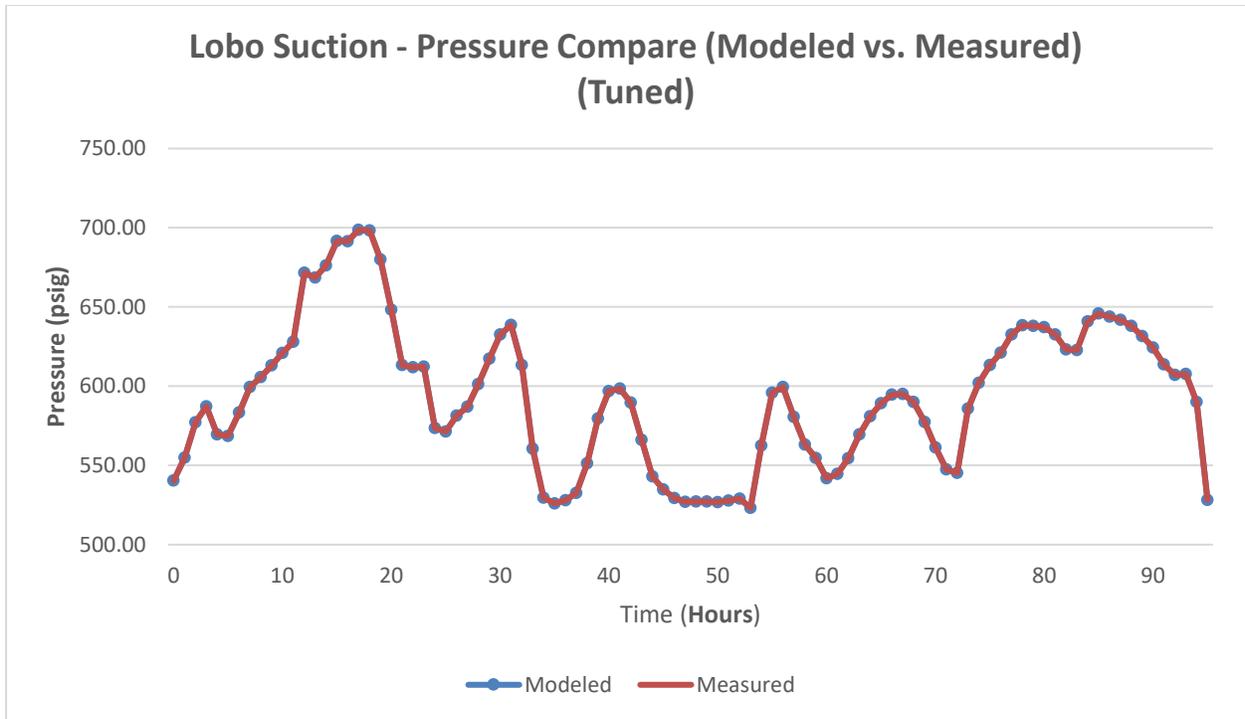

Figure 8: Lobo Suction Pressure Compare

Lobo to Bright

The second segment verified was the 4 lines between the Lobo and Bright Compressor Stations. Pressures were compared to actual measurement at Lobo and three other intermediate take-offs with pressure measurement; London North, St Mary’s and Beachville. Flow profiles were defined at Lobo and all other demand points active for the analysis period. A corresponding pressure profile of actuals was defined at the Bright Compressor Station. 96 hours of modeled results were exported and compared to actuals. Pipeline efficiencies in the model were tuned to minimize the absolute pressure differential between field measurements and modeled results. A 0.1% absolute average difference over the 96 hours was used as a target to determine the required pipeline efficiency.

Table 2 and Figures 9-13 demonstrate that only a small change to efficiency (0.01) was required to align modeled and measured pressure results. The Lobo to London North and London North to St. Mary’s show some differences in individual hours when tuned; however, the average pressure differential remains 0.1% over the course of the 96 hours. These differences were attributed to the proximity to the Lobo discharge and some fluctuation with compressor units cycling on and off during the analysis period. No further analysis on the Lobo to Bright segment was conducted. Figure 13 confirms that the pressure profile defined at Bright based on actuals matches what is being produced when simulated.

<u>Section</u>	<u>Base Pipeline Efficiency</u>	<u>Absolute Average Pressure Difference (Base) (%)</u>	<u>Tuned Pipeline Efficiency</u>	<u>Absolute Average Pressure Difference (Tuned) (%)</u>
Lobo to London North	0.99	0.3%	1.00	0.1%
London North to St. Mary's	0.99	0.3%	1.00	0.1%
St. Mary's to Beachville	0.99	0.0%	1.00	0.3%*
Beachville to Bright	0.99	0.2%	1.00	0.0%

Table 2: Lobo to Bright Efficiencies and Pressure Difference (Original vs. Tuned)

*St. Mary's to Beachville was left at an absolute average of 0.3%, since this is the closest difference that could be achieved within Synergi's efficiency increments of 0.01. Therefore, an adjustment to pipeline roughness will be made in the updated Design Day model to bring it within 0.1% difference.

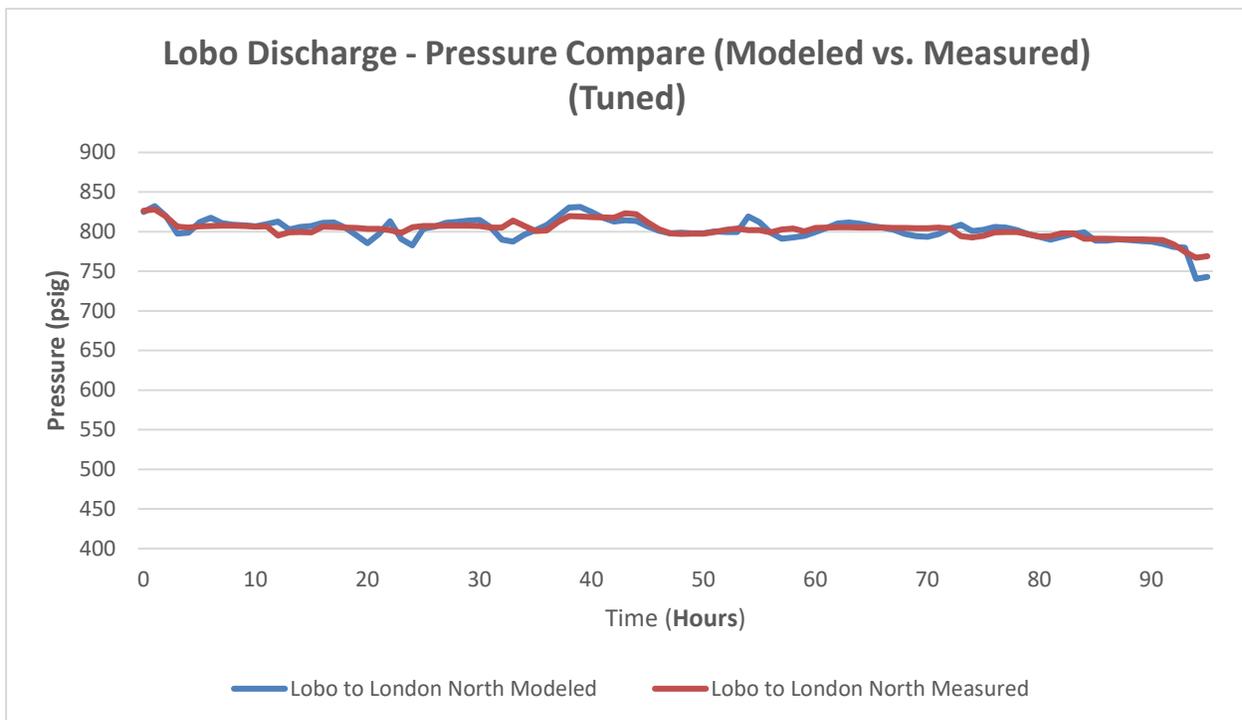

Figure 9: Lobo Pressure Compare

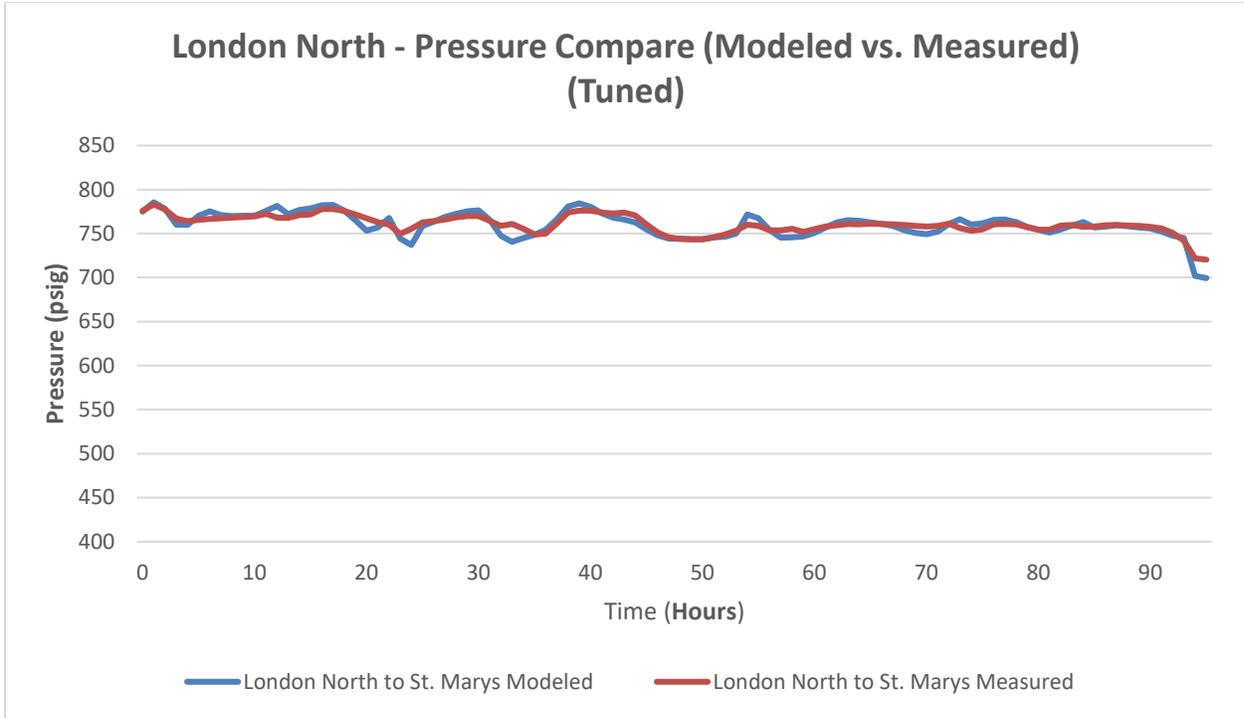

Figure 10: London North Pressure Compare

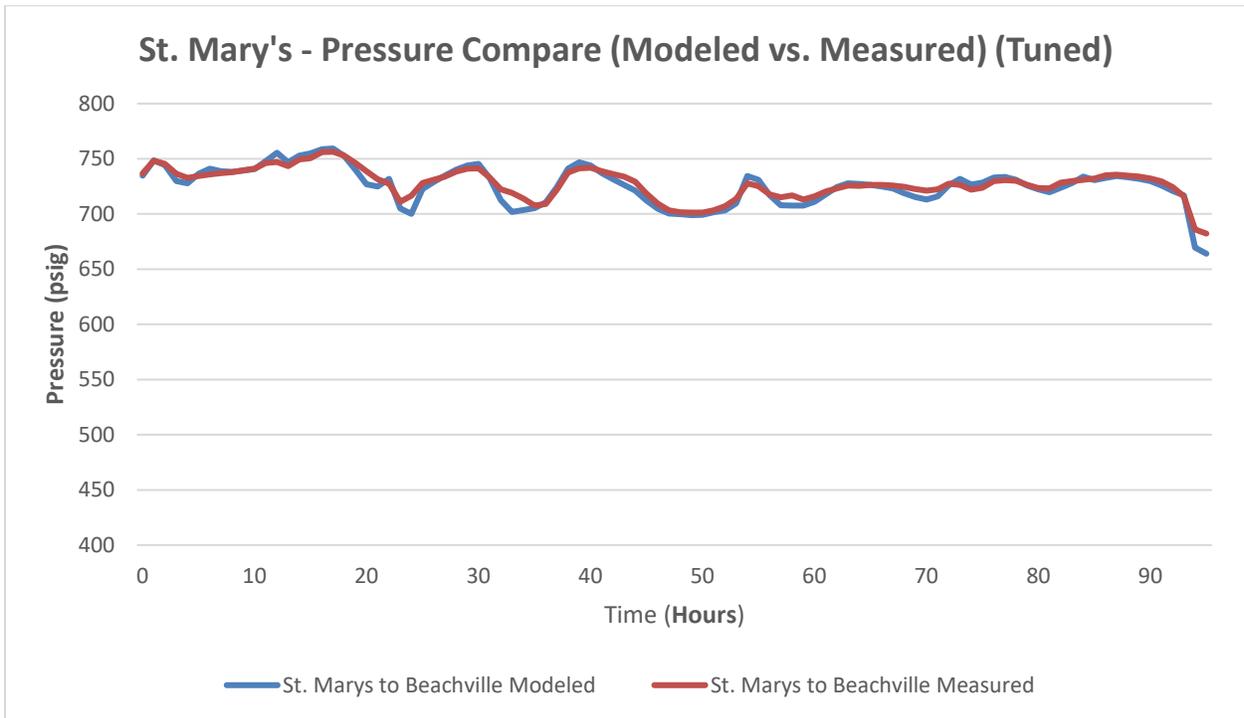

Figure 11: St. Mary's Pressure Compare

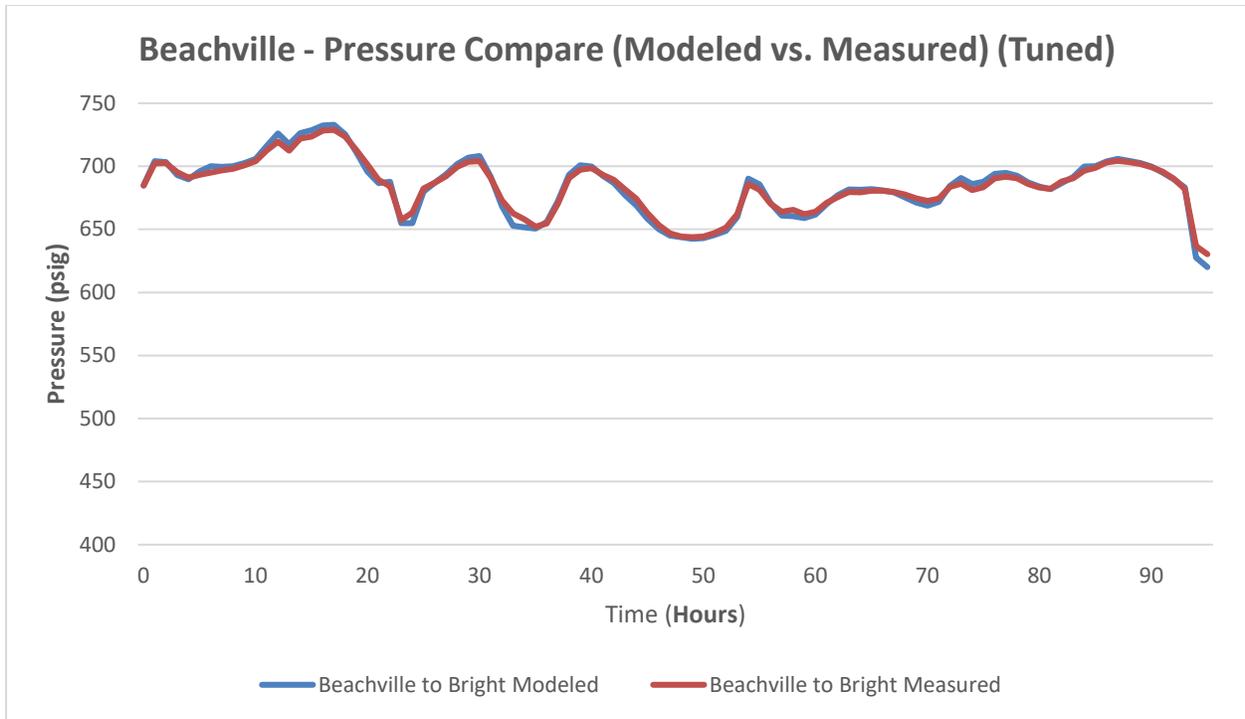

Figure 12: Beachville Pressure Compare

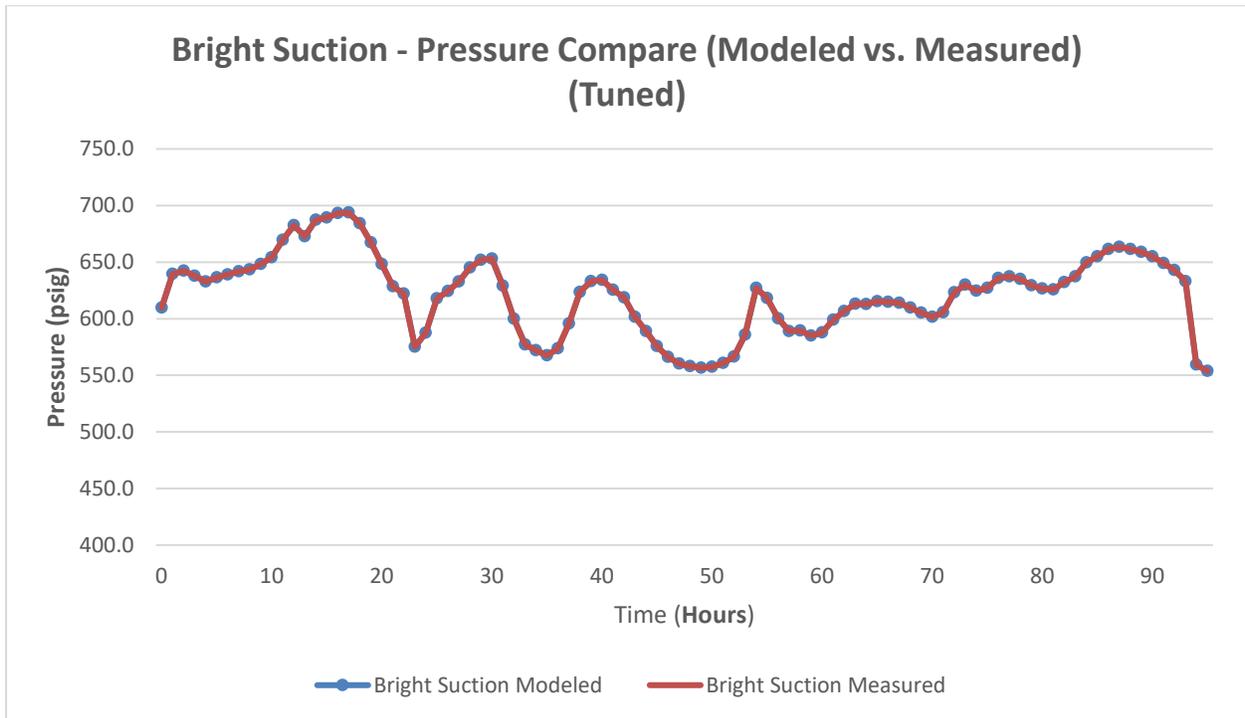

Figure 13: Bright Suction Pressure Compare

Bright to Parkway

The third segment verified was the 4 lines between the Bright and Parkway Compressor Stations. Pressures were compared to actual measurement at Parkway and five other intermediate take-offs with pressure measurement, Milton, Hamilton, Kirkwall, Brantford, and Owen Sound. Flow profiles were defined at Parkway and all other demand points active for the analysis period. A corresponding pressure profile of actuals was defined at the Bright Compressor Station. 96 hours of modeled results were exported and compared to actuals. Pipeline efficiencies in the model were tuned to minimize the absolute pressure differential between field measurements and modeled results. A 0.1% absolute average difference over the 96 hours was used as a target to determine the required pipeline efficiency.

Like the Lobo to Bright sections, Table 3 and Figures 14-20 demonstrate that only a small change to efficiency (0.01) was required to align modeled and measured pressure results. When the pipeline efficiencies were adjusted to 1.0, each of the sections came within the 0.1% absolute average pressure difference between modeled and measured pressures. Figure 14 shows the modeled discharge pressure at Bright Compressor Station. Like Figures 1-3, the modeled and measured values are very close, since Bright is where the pressure profile is defined. No further analysis on the Bright to Parkway segment was conducted.

<u>Section</u>	<u>Base Pipeline Efficiency</u>	<u>Absolute Average Pressure Difference (Base) (%)</u>	<u>Tuned Pipeline Efficiency</u>	<u>Absolute Average Pressure Difference (Tuned) (%)</u>
Bright to Owen Sound	0.99	0.1%	1.00	0.1%
Owen Sound to Brantford	0.99	0.3%	1.00	0.1%
Brantford to Kirkwall	0.99	0.3%	1.00	0.0%
Kirkwall to Hamilton	0.99	1.0%	1.00	0.1%
Hamilton to Milton	0.99	1.2%	1.00	0.1%
Milton to Parkway	0.99	1.4%	1.00	0.0%

Table 3: Bright to Parkway Efficiencies and Pressure Difference (Original vs. Tuned)

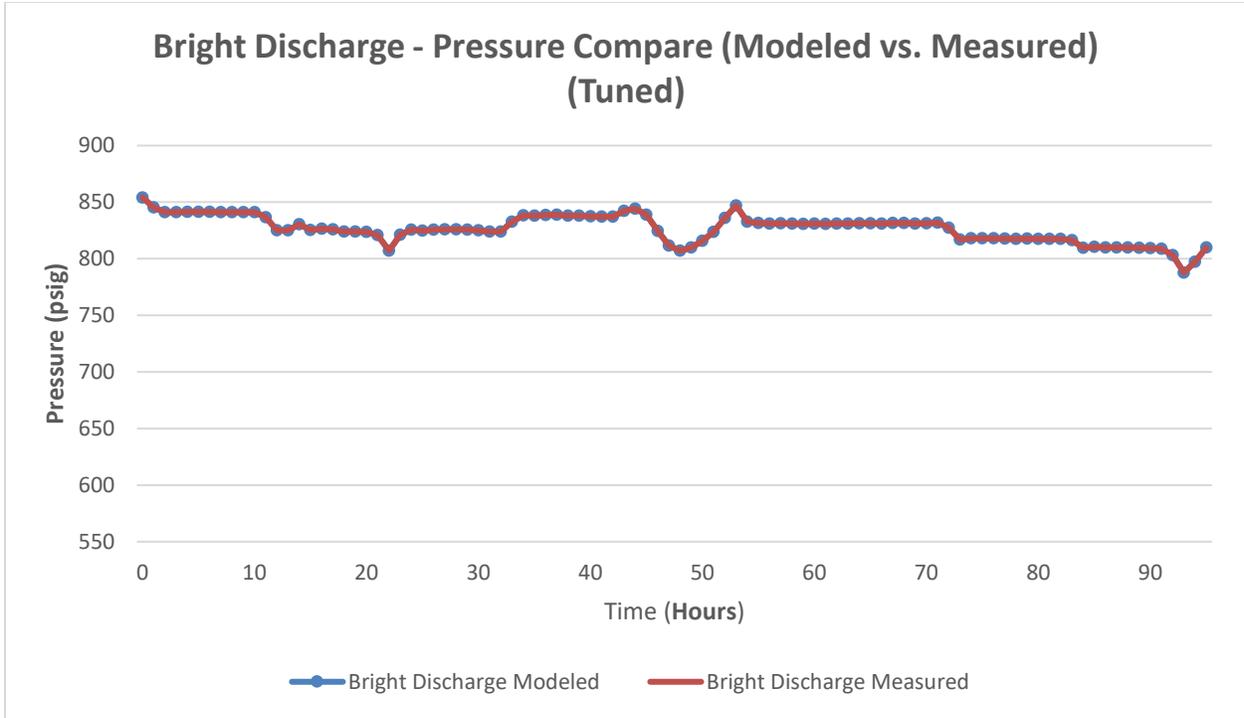

Figure 14: Bright Discharge Pressure Compare

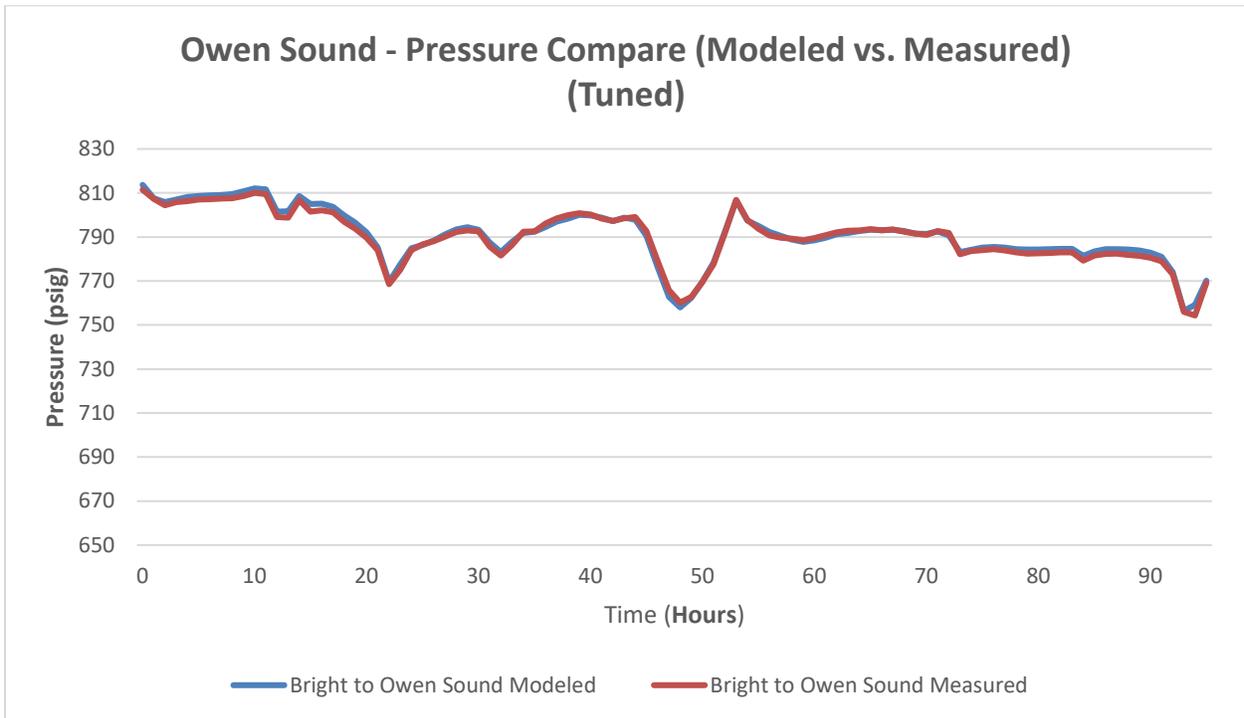

Figure 15: Owen Sound Pressure Compare

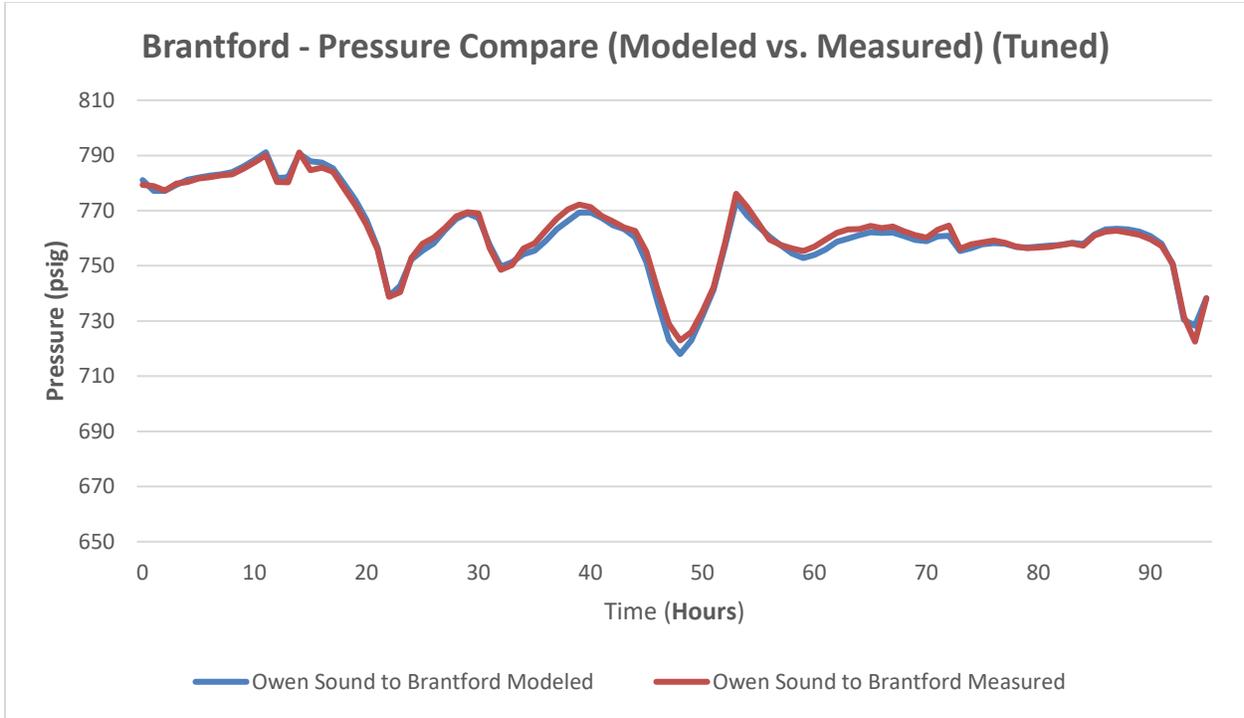

Figure 16: Brantford Pressure Compare

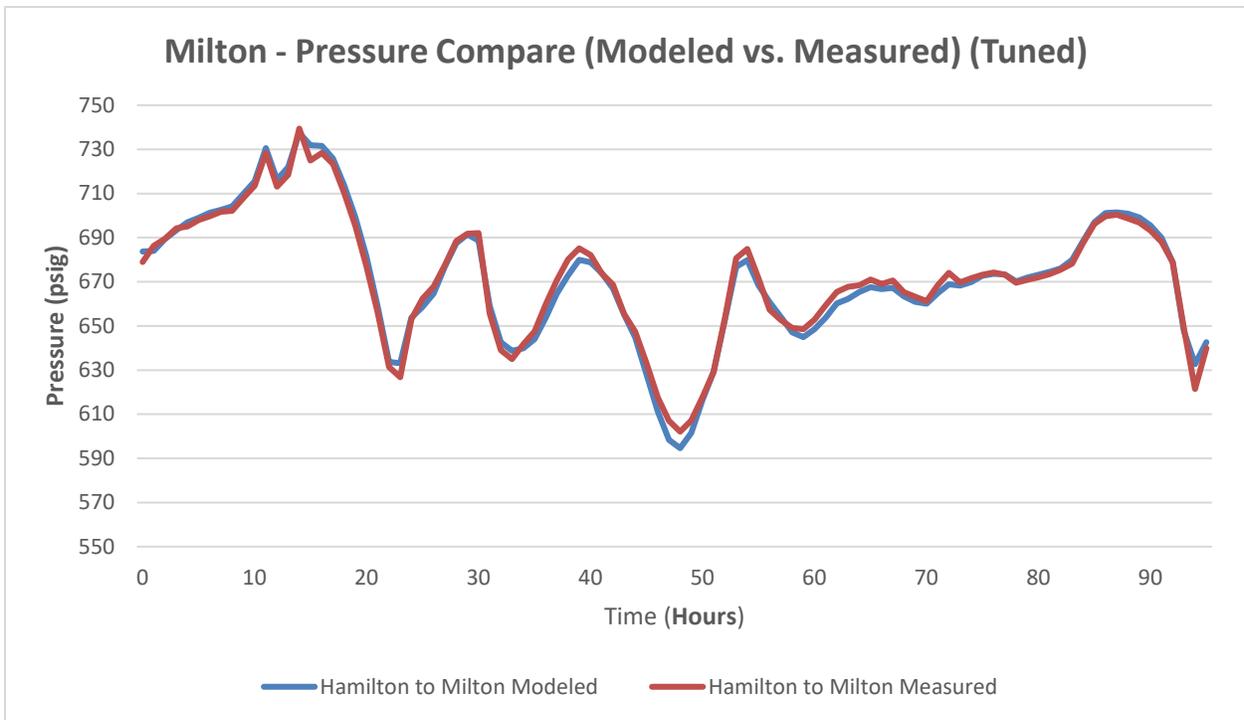

Figure 19: Milton Pressure Compare

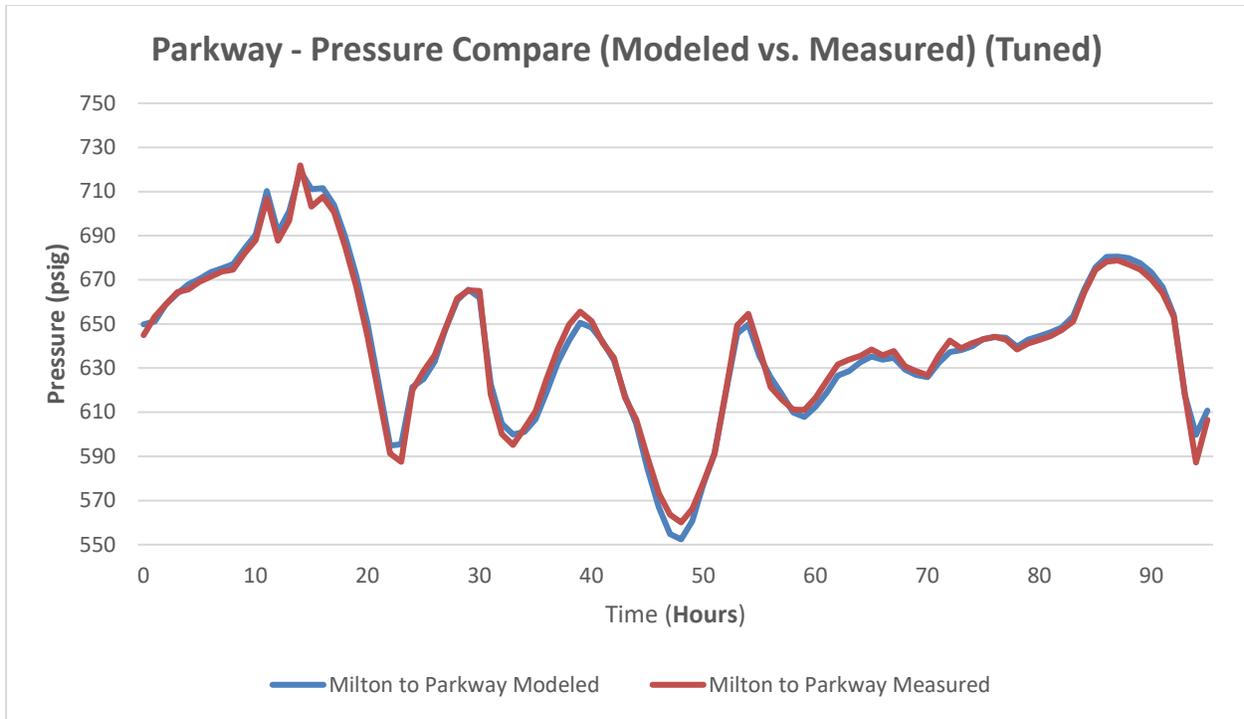

Figure 20: Parkway Pressure Compare

Results and Impacts

Since the Lobo to Bright and Bright to Parkway segments required little tuning to their pipeline efficiencies, no additional analysis was conducted beyond what is presented in this report. The Dawn to Lobo segment required reduction to pipeline efficiencies that is outside what would normally be expected when tuning the model during verification. These results prompted additional investigation, where this analysis was repeated for different historical high flow analysis periods. Each of these additional tests yielded similar lower efficiencies required to match modeled and measured pressures. It has been narrowed down that the worst efficiency issues are in the Dawn to Enniskillen segment in the NPS 42 and NPS 48 pipelines.

If the lower efficiency values were translated to the Dawn to Parkway Design Day model, it would result in an approximate loss of capacity of 165 MMscfd. Therefore, Transmission System Planning is working with Capacity Planning, Storage and Transmission Operations, Pipeline Engineering, Integrity Management, and other groups to determine the cause of the issue.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 3, pg. 2 & EB-2022-0133 Exhibit I.FRPO.5 , Attachment 1

Preamble:

EGL evidence states: *Enbridge Gas's proposed approach to determine design demand and its selection of design criteria aligns with the no failure approach in that it captures the coldest weather event experienced. It is a proven method used by Union and a majority of other utilities. It is an approach that is clear, simple, and repeatable...*

The design criteria and design demand processes need to consider not only the design conditions but also the impact on day-to-day system operations when evaluating potential changes in approach.

Question(s):

Please reproduce the FRPO.5 exhibit referenced above updated for any information that may have changed since its original production.

Response:

Please see response at Exhibit I.2.7-SEC-150, Attachment 1, page 1.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 3, pg. 3

Preamble:

EGI evidence states: *To prevent distribution system failures, a condition that is unacceptable to its customers, EGD also included engineering assumptions that further reduced the risk of not meeting the design day demand. As an amalgamated utility, this approach is not appropriate for integrated transmission, distribution, and storage assets. Design demands need to be granular and aligned to actual observed customer behaviour and very cold weather.*

Question(s):

Please explain fully:

- a) The engineering assumptions that further reduced the risk of not meeting the design day demand.
- b) What approach is not appropriate for integrated transmission, distribution, and storage assets.

Response:

- a) The proposed harmonization of processes provided at Exhibit 4, Tab 2, Schedule 3 concerns much more than just the calculation of the design day degree day temperature to be used. The harmonization of the design hour demand process includes adjustments to five key engineering assumptions from what was included for the determination of design day degree day in the EGD rate zone. The way that these assumptions were applied in the EGD rate zone had the effect of reducing the risk associated with a relatively risky 1 in 5 recurrence interval:
 - Load trueing: Alignment of general service daily demands to actuals experienced at gate stations as an early step in developing demand. This ensures that

modelled flows align with actual system flows.

- Peak hour factor: An adjustment factor to convert daily into hourly demand is derived from actual demand profiles using consumption data from gate stations that supply the region instead of a generic 1.2 hour factor. Please see response at Exhibit I.4.2-FRPO-121 for examples of the profiles used.
- Contract rate customer alignment: The contract rate customer demand now includes an alignment based on customer historical usage as provided at Exhibit 4, Tab 2, Schedule 3, page 29, paragraph 60 which takes into account specific customer five-year history.
- Commercial customer diversification: The same process for contract rate customers is used to create a diversification factor applied to general service commercial customers instead of the fully connected load requested.
- General service forecast: New forecasted general service customer demands are calculated using historical consumption data for customers of a similar rate class and type instead of generic load demand assumptions.

The primary goal of these engineering assumption changes, and the harmonized design criteria and design demand process is to create hydraulic models, and associated customer demand loading, that most accurately represent the needs of our customers in all conditions and temperatures for both forecasting and operational needs. The energy transition demand assumptions are then applied on all these engineering assumption improvements. These improvements result in better aligned demands (reduced demand) to actual observed customer behaviour resulting in the weather and cold temperatures becoming the critical risk element to ensuring reliable service to customers

In simpler terms, the EGD method has a more conservative approach to developing design demands which was paired with a less conservative approach to develop its design day degree day. The safety factor for the design was contained in the engineering assumptions. The Union method has a more conservative approach in developing the design day degree day which was paired with a less conservative approach to develop its design demands. The safety factor for Union is contained in the design day degree day. Now that the EGD method is proposed to be harmonized with an approach where the safety factor is in the design degree day and has little conservatism in the design demands, it needs to be paired with a more conservative approach (coldest observed) to develop its design degree day. The “total package” must be considered. It is Enbridge Gas’s opinion that the proposed method is sound, aligned to industry best practices, the design demand is developed as close as possible to actual customer consumption and the safety factor aligns with the

weather risk, and will be able to reliably serve its customers demand during very cold weather conditions.

- b) The EGD engineering assumption that is inappropriate is the short return period (i.e., 1 in 5-year recurrence interval) used for the probabilistic method. Enbridge Gas’s proposed approach to determine design demand and its selection of design criteria aligns with the no failure approach in that it captures the coldest weather event experienced and used by a majority of gas utilities. Aligning a high risk 1 in 5-year recurrence interval with the proposed design demand methods which have little conservatism built into it is very risky. As a comparator, the Union South rate zone was using a 1 in 50-year recurrence interval in its probability-based method to develop its design day demand prior to 2013 when it switched to a coldest observed method. Please see Exhibit 4, Tab 3, Schedule 2, paragraphs 3 and 9.

After reviewing the Company’s weather history, the number of times the HDDw would exceed the 1 in 5-year recurrence interval is shown in Table 1. Having the risk of demand exceeding the system capacity every few years is an unacceptable risk to society as provided at Exhibit 4, Tab 3, Schedule 2 paragraphs 18 to 20. In order to be responsive, an estimate of the probabilistic 1 in 5 year recurrence interval for the weather stations was estimated using a normal distribution and the current Legacy EGD HDD was reduced by 3 HDD in the Enbridge CDA Central and Niagara and EDA to align with the proposed base temperature of 15°C.

Table 1
HDDw based on 1 in 5 Year Recurrence Interval and Exceedance Statistics

Line No.	Weather Station	1 in 5 Year Recurrence HDDw15 (a)	Number of times exceeded in past 10 years (b)	Number of times exceeded since 1979 (c)

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 3, pg. 15-20

Preamble:

The reference pages explain the company's proposals for the selection and use of historical data and selected criteria to establish design condition, including the use of the current base temperature of 18 degrees Celsius vs. the proposed 15 degrees. On page, once the formula is expressed, the evidence states: "Once the hourly wind speed adjusted temperatures are calculated they are converted into HDDw using a base temperature of 15°C.

We would like to understand the basis for proposing a change to the heating degree day base that has been used by the legacy utilities for decades.

Question(s):

What analysis has EGI performed to justify the change of base temperature to 15°C while removing the utilization of baseload for the purposes of creating the design day load?

- a) Please confirm that Marquette Analytics still uses 65 degrees Fahrenheit or 18.3 degrees Celsius.
 - i. How does EGI propose to adjust the associated baseload in moving to 15°C?
 - ii. What would be the impact of moving from an 18 degree with baseload to a 15 degree base without baseload on the demands fed by the Dawn-Parkway system (please include Union South and Enbridge CDA impacts)? Please provide the numeric amounts under both 18 degree with baseload and 15 degree without baseload scenarios.
 - (1) Please provide the results of both methodologies on the Dawn-Parkway schematic that shows laterals and demands.
 - iii. Please do the above analysis in ii) using 18 degree without baseload as a comparison to 15 degree base without baseload.

- b) Viewing Table 1, it is clear that the only difference between the 18 and 15 degree bases moves the HDD by the 3 degrees lower. Mathematically, and for the purposes of forecasting, this lower total HDD serves to increase the forecasted load when extrapolating from a given temperature to the peak design temperature. Please confirm or explain by use of numeric example(s).

Response:

The analysis is provided at Exhibit 3, Tab 2, Schedule 5. The analysis proposes to adopt using a base temperature of 15°C across all Enbridge Gas functions.

The EGD rate zone¹ is currently using base temperature of 14.8°C, 14.6°C and 15.3°C for the Central, Eastern, and Niagara zones respectively. These temperatures have been in use since they were OEB approved in 1994². Attachment 1 Exhibit C2, Tab 7, Schedule 1 from the referenced proceeding.

A literature review was completed as part of E.B.R.O 487, Exhibit C1, Tab 9, Schedule 1, which is provided at Attachment 2.

Would you please explain the genesis of 18°C?

Yes. The Company attempted to determine the basis for 18°C through literature reviews. All material found was based on work performed in the United States. Studies by Baltimore Gas & Electric (1925), the American Gas Association (1927), and the National District Heating Association (1932) found a balance point of 65°F, which soft converted to SI units is 18°C.

Those studies were done almost 70 years ago in different geographical areas of North America. Since then, significant technological advances have led the Company to reexamine the appropriateness of 18°C as a base for determining heating response.

Do other utilities use 18°C?

Most do, but there is a trend to move away from an arbitrarily set value of 18°C to a value developed using research of market responses to temperature. One utility that has moved is Ontario Hydro. In the United States three gas utilities that have moved to balance points other than 18°C for both operational and revenue forecasting purposes are: Columbia Gas of Columbus, Ohio; Consolidated Edison of New York, New York; and Pacific Gas and Electric of San Francisco, California.³

¹ Not currently used in Engineering derivation of design day HDD.

² EBRO 487. Decision with Reasons, November 15, 1994.

³ Attachment 2, p.3.

Confirmation that Pacific Gas & Electric continues to use customized base temperatures to calculate HDD is quoted below.

Equipped with new customer usage information, the gas planning department looked for ways to improve model loading. The first area of study involved the derivation of new Heating Degree Day (HDD) base temperatures. The HDD base temperature defines the temperature threshold that customers are expected to begin space heating. PG&E operates 24 weather stations to support forecasting within numerous microclimates in the service territory, and all customers are assigned to a representative weather zone. By studying the usage of the customers within each weather zone, the daily usage patterns clearly exposed the customers' temperature sensitivity that was lost within the monthly billing usage. The study produced unique HDD base temperatures for each of the 24 weather zones in the PG&E service territory. In particular, the change in the HDD base temperatures for the coastal areas increased design day loads by up to 17%.⁴

A search of Wikipedia on heating degree days⁵ indicates that Europe uses base temperatures other than 18°C. The EU uses 15.5°C, Denmark and Finland use 17°C, Switzerland uses 12°C.

The default values for base temperature have remained unchanged for decades despite significant advancement of energy efficiency, building materials, insulation, building envelop tightness improvements, and an increase in the number of heat-generating appliances in homes.

- a) Not confirmed. Marquette Analytics ("Marquette") recognizes that base temperatures can be different than 65°F and is somewhere between 55°F and 65°F. A quote from Marquette's paper Mathematical Models for Natural Gas Forecasting⁶ confirms that they use a second base temperature of 55°F in their model to determine an optimal base temperature (underlined for emphasis).

When temperatures are cold, as temperature increases, gas consumption decreases in a nearly linear way, although once the ambient temperature reaches approximately 55 to 65 degrees Fahrenheit, consumption levels off. Once the average temperature reaches a certain temperature, space heating no longer occurs; consumption levels are near some constant value known as base load.⁷

⁴ Multi-parameter Residential Hourly Profile Models Using AMI Hourly Customer Gas Usage Data, May 10, 2016, p.3, <https://onepetro.org/PSIGAM/proceedings-abstract/PSIG16/All-PSIG16/PSIG-1616/2187>

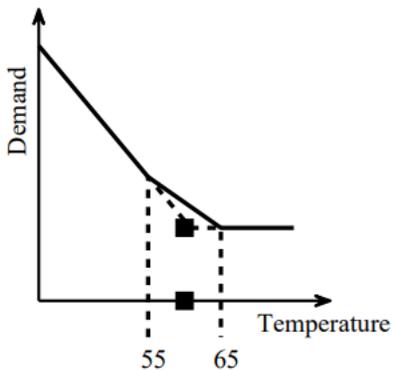

⁵ Wikipedia. Heating degree day. https://en.wikipedia.org/wiki/Heating_degree_day

⁶ Mathematical Models for Natural Gas Forecasting, Winter 2009, https://epublications.marquette.edu/cgi/viewcontent.cgi?article=1291&context=electric_fac

⁷ Ibid, p.812.

Over time, the HDD reference temperature has changed. One way to adjust for this change is to add a second HDD factor to the model. Here we add the second HDD factor with a reference temperature of 55°F, which automatically generates an optimal HDD reference temperature as illustrated in Figure 3⁸

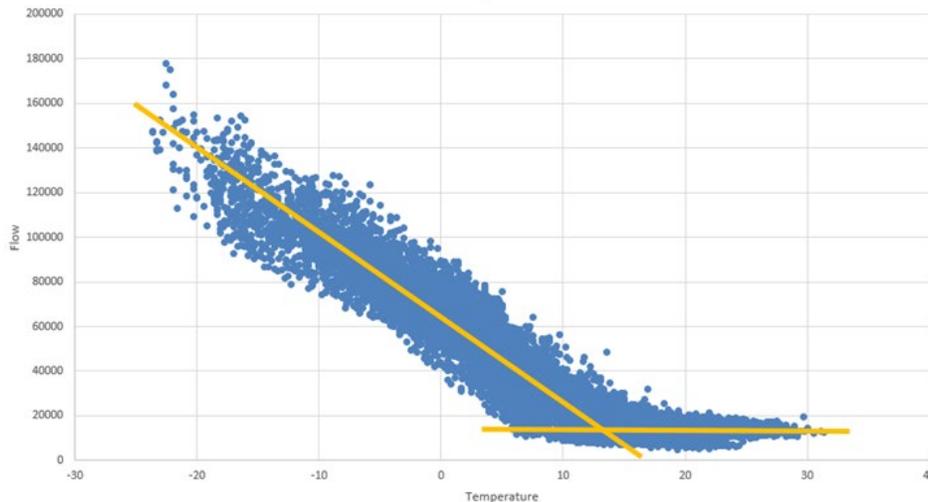

Figure 1: Marquette's Figure 3

Base temperature is important and required for quantifying non-heating gas usage. It allows for better hydraulic modelling during construction season, better bill estimation, understanding annual gas consumption, and prediction of off-peak injection potential for RNG and local producers. The optimal base temperature is the location where the trend line of the heat sensitive data intersects the trend line of the base load data as shown in Figure 2.

⁸ Ibid, p.813

Figure 2: Illustrative Example of where Base and Heat Load Intersect

The conclusion is that no matter what method companies use to develop their design demands, consideration should be made in choosing an optimal base temperature to derive HDDw to improve data correlation statistics.

i-iii. Enbridge Gas interprets the meaning of the term baseload in this question to mean an analysis that includes summer data points from April to October. The customer's baseload demand is included in the data at all times of the year and is more easily identifiable in the summer when heating equipment is off. Therefore, the term "without baseload" is interpreted to include data points from the winter months only. The term "with baseload" is interpreted to include data points from the summer months as well as the winter months.

The proposed design day demand methodology utilizes winter only data, that is data from November 1 to March 31 and would be a "without baseload" process based on the definition above. This process eliminates the impact of the transition between base and heating load that would occur if the summer months data was included which could skew the data if the optimal base temperature is not used to calculate HDD. The choice of base temperature is not overly important to the design demand calculation because the summer months are not included.

Adjustments to baseload are not required for the proposed design day demand methodology when changing the base temperature used to determine heating degree days from 18°C to 15°C.

The design hour demand method is currently a "with baseload" process. The design hour demands are developed using the DNV Synergi Gas software,

specifically the Customer Management Module. The regression analysis uses data from two entire years of monthly billing records to develop heat and baseload factors for each customer. Because two entire years of data is included in the analysis it includes the summer month baseload data. The use of the correct base temperature is much more relevant to the design hour demand method than to the design day demand method.

The graphs below in Figures 3 to 5, provide an illustrative example of the design hour demand method with some different base temperatures and the trend lines fit to the data. Figure 5 illustrates the raw data of demand and HDDw for base temperature of 18°C. The “bottom” of the blue dots between 0 and 10 HDD becomes horizontal. The red trend line does not fit the data well (lower R²) and underestimates demand at high HDDw and overestimates demand at low HDDw. Figure 3 illustrates a base temperature of 10°C. The location where base load starts to transition to heat load is not observable on the bottom blue dots. The red trend line does not fit the data well (lower R²) and overestimates demand at high HDDw and underestimates demand at low HDDw which is opposite to the 18°C results. Base 13.5°C, shown in Figure 4, is optimal in this particular case with the red trend line dissecting the data point to maximize the R² value (correlation statistic).

Figure 3. Graph Illustrating Trend Line and Correlation Statistics for Base 10 HDD

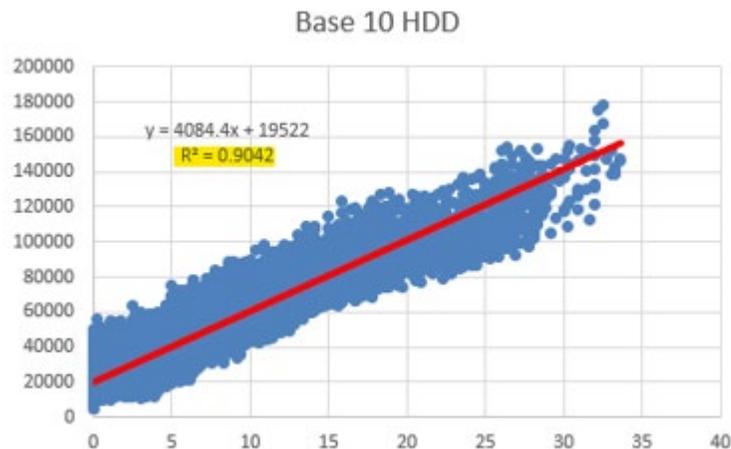

Figure 4. Graph Illustrating Trend Line and Correlation Statistics for Base 15 HDD

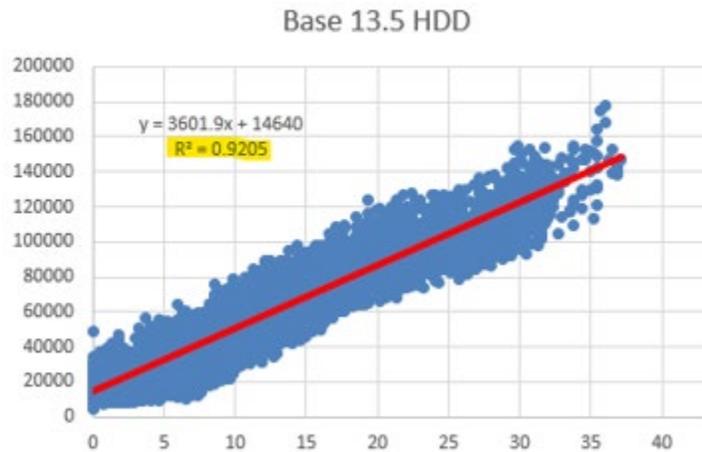

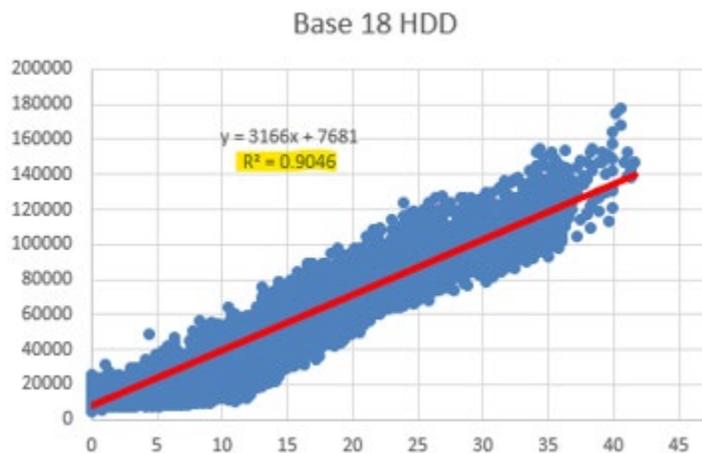

Figure 5. Graph Illustrating Trend Line and Correlation Statistics for Base 18 HDD

The DNV Synergi Gas software Customer Management Module calculates the base and heat load factors and calculates a statistic called “FCQ 20”. FCQ 20 indicates the customer’s baseload factor was calculated to be a negative and subsequently sets the baseload demand to zero. In hydraulic modelling terms this negative means the customer is a source of gas to the system (acts like a supply) which is an impossibility and indicates the base temperature of 18°C is incorrect.

Table 1 shows the results of an analysis completed for four areas across the franchise. The Percent FCQ for 18°C base temperature ranges from 37% in Thunder Bay to 22% in London. This means there is a significant amount of missing baseload demand in the distribution models. Table 1 also shows the results of various base temperatures with 13.5°C being the optimal based on the

Weighted Correlation being highest. The Percent FCQ 20 was also significantly reduced to between 5 and 6%.

Harmonization of the methodologies between Engineering and Finance landed at using a base temperature of 15°C which improved the Percent FCQ 20 significantly.

Table 1
FCQ 20 Factors at Various Base Temperatures

		Base Temperature			
		System	13	13.5	14
Weighted Correlation	Thunder Bay	0.935077	0.935258	0.935244	0.931598
	Sudbury	0.927273	0.927334	0.927317	0.922161
	Kingston	0.914781	0.914814	0.914561	0.906001
	London	0.924715	0.924923	0.924352	0.918257
Percent FCQ 20	Thunder Bay	5.11	6.08	7.3	37.07
	Sudbury	6.54	7.88	9.35	33.49
	Kingston	6.31	7.35	8.57	28.26
	London	4.81	5.66	6.56	22.09

It is not practical to provide an overall figure or hydraulic modelling impacts for Union South and Enbridge CDA given the timelines of this proceeding due to the amount data that needs to be processed. To be responsive a sample of existing general service design day demand is shown in Table 2 for Winter 2021/2022. Please also note that the difference in demands between HDDw18 and HDDw15 without baseload includes other parts of the harmonization methodology that creates the differences shown. This means there are more changes than just the change between base temperatures.

Table 2
 Existing General Service Customer Design Day Demand with and without Baseload Impacts

General Service							
Winter 2021/2022	HDDw18 Without Baseload		HDDw15 Without Baseload		HDDw15 With Baseload		
System	R ²	Demand (10 ³ m ³ /day)	R ²	Demand (10 ³ m ³ /day)	R ²	Demand (10 ³ m ³ /day)	% Difference
London	0.96	5236.199	0.94	5098.776	0.97	5646.874	104%
Forest Hensall Goderich	0.94	2320.528	0.92	2228.594	0.96	2326.241	103%
Eastern	0.94	5206.432	0.94	5054.270	0.95	5208.205	111%
Owen Sound	0.93	4530.610	0.95	4381.392	0.95	4879.349	106%
Cambridge	0.93	1669.005	0.91	1607.445	0.97	1708.023	107%
Guelph	0.94	2181.217	0.93	2112.832	0.96	2257.570	109%
Hamilton	0.93	5699.562	0.91	5490.865	0.96	5988.537	101%
Milton Oakville Burlington	0.91	6987.495	0.89	6674.893	0.96	6765.547	106%

- b) The only difference between the 18°C and 15°C degree base temperatures is it moves the HDD by 3 degrees lower, assuming all other variables and calculations remain the same and the only change is made to the base temperature for the calculation of the HDDw and design day HDDw.

Changing the base temperature does not change the design day demand. It remains exactly the same volume. This is because the design degree day that the data is extrapolated to is also reduced by 3 HDD.

This is illustrated by the following example shown in Figures 6 and 7. The data points shown are developed using the current calculation method for HDDw using the London weather station and the design degree day of 43.1 HDDw. Figure 6 shows the calculation for 18°C base temperature extrapolated to the design day HDDw of 43.1. Figure 7 shows the calculation for 15°C base temperature extrapolated to a design day HDDw of $(43.1 - 3) = 40.1$ HDDw. The calculation is summarized in Table 3 where column (d) shows both base temperatures arrive at the same total demand.

The example below does not have data points where the outside temperature is between 15°C and 18°C (i.e. HDDw were not between 0 and 3 HDD). In the event that the outside temperature is between 15°C and 18°C (0 and 3 HDD), on a particular day, the resultant design day demand would be slightly different, however those differences would be very minor. This difference would be that the data points

between 0 and 3 HDD would become negative and reset to zero in the base 15°C.

Changing base temperature from 18°C to 15°C does however impact the design hour demand calculation used for the distribution system, as illustrated in the response to part a) above.

Heating Load Model Analysis

1 Executive Summary

This paper explains the analysis and development of a better model for estimating heating loads, and for normalizing actuals for comparison to forecasts. The model was developed through an extensive investigation into the relationship of the conventional heating load model based on heating degree days calculated from an outside temperature of 18°C to actual observed heating loads using load research customer sample data and detailed analysis of historical customer billing data. This new model is calibrated to the observed relationships between temperature and heating using customer billing data, rather than using an assumed relationship based on a temperature base of 18°C. The calculated balance points developed from customer billing data were compared to the balance points using load research sample data for confirmation of the proposed method.

This proposed method is called the balance point degree day method. This refers to the fact that rather than assuming a heating load starts at 18 °C, the actual temperature at which heating load occurs is calculated from billing records. This analysis has no impact on the Ontario Energy Board's approved degree days forecasting methodology, it only varies the sales response to those degree days.

Analysis of customer bills and load research customer data by the three weather zones found that each zone has unique balance points of 14.8, 14.6, and 15.3 for Central Zone, Eastern Zone, and Niagara Zone respectively. These balance points are more appropriate for estimating heating loads than using an assumed base of 18 °C.

2 Introduction

The Company regularly reviews its procedures for setting volumetric forecasts and normalization of actual volumes to those forecasts in its ongoing effort to improve. Heating demand is currently estimated and normalized using the classic engineering model for heating end uses. This model assumes that the demand for heat increases uniformly as the temperature drops below 18°C. Technical literature¹ suggests that this is not necessarily so, and refinements can be developed to improve the performance of the heating load model.

Heating Load Model Analysis

Advances in technology have enabled the Company to research the appropriateness of the model and propose improvements to it. This research was undertaken by the Load Research section of the Rates department and has been enabled through end-use metering. The result of this work is a statistically adjusted engineering model calibrated to the different heating markets.

3 The Heating Load Model

The conventional heating load model is a simple linear model founded on the basic energy flow equation:

$$Q = U\Delta E \quad (1)$$

In this equation, the quantity flowing Q is equal to the product of a constant value U and an energy differential ΔE . This equation underpins many basic behaviours, such as electrical flow through wire and gas flow through pipe. Such equations are called linear for they explain increases in flow as a uniform response to increases in the energy differentials. That is to say, in a gas distribution pipe, flow will uniformly increase as the pressure differential increases.

Applying this equation in a simple manner to heating load, the equation becomes:

$$Q = U\Delta T \quad (2)$$

Where: Q is the quantity of gas demanded

U is a constant

$$\Delta T = (T_i - T_o) \quad (3)$$

and; T_i is the inside temperature of a building

T_o is the outside temperature of a building

This equation 2, the heating load model, expresses heating load as a linear relationship with the temperature differential $(T_i - T_o)$. With such a model, the *increase* in natural gas usage will be the same for a temperature change from 8°C to 7°C as for a change from -8°C to -9°C. The model is constrained so that $Q = 0$ for T_o greater than T_i .

4 Analysis of the Model

The model expressed by equation 2 conceptually is a relationship between average natural gas demand for heating use per temperature and temperature. This analysis of the model, and suggestions for improvements, is based on understanding its two components, the variable temperature differential ΔT , and the constant U .

Heating Load Model Analysis

Through load research the outside temperature and furnace load can be independently observed and from those observations improvements have been suggested.

The Temperature Differential

The temperature differential, when calculated on a differential referenced to a standard base temperature, is called heating degree days. Heating degree days is a measure of coldness and takes into account that resistance to heat flow out of a building is impeded by the insulation in the building's envelop. It has been historically assumed at Consumers Gas that because of insulation, an outside temperature below 18°C is needed for heating load demand. Thus degree days are calculated from 18°C rather than from the inside temperature of a structure as stated in equation 3. This means that, on a day when the outside temperature averages 17°C, one degree day is calculated.

The temperature below which heating load begins is referred to as the balance point. This refers to the fact that the energy flows into and out of the structure are in balance: no additional heating is required to maintain the inside temperature.

The Constant

For a specific building, the constant will reflect that building's heat energy efficiency, and the characteristics of the use of the building. For example, the energy efficiency of a home will reflect, among other things: the efficiency rating of the furnace, the level of maintenance of the furnace, and the building code, which is a reflection of the standard for insulation to which the house was built. For the same home, characteristics such as: thermostat setting, number and age of occupants, and size, number, and level of use of other sources of heat gain (stoves, showers, other appliances) are typical factors that affect the constant. Although these factors can change, it is assumed in the model that, for the period of time analyzed, they do not change to any significant degree.

The constant factor is called the "average use per degree day".

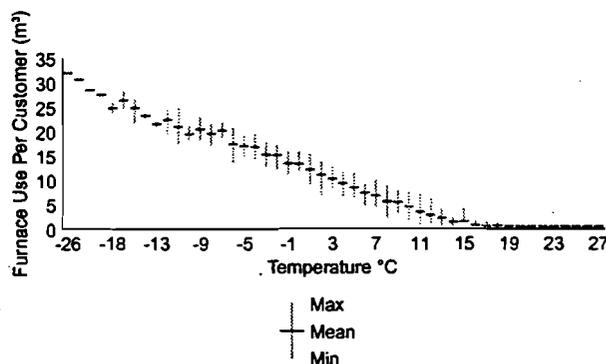

Observations

Observations of sample data on furnace loads from load research show that the assumption: natural gas demand for heating is linear with temperature, is essentially correct as illustrated in Figure 1. In this figure the actual average furnace loads from a sample of customers with end use metering is shown. In this plot the observed range between the average highs and lows for furnace loads at each temperature are illustrated as well as the means.

By observing the means, a near linear progression of increased furnace load as the

Figure 1

Furnace Load vs Temperature

Note: Data based on a sample of Central Zone

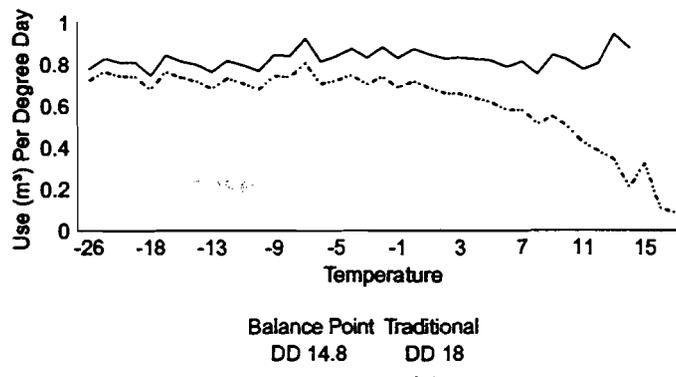

Heating Load Model Analysis

temperature declines can be seen. This actual relationship lends support to the assumption employed in the model that use is linear with respect to temperature.

However, this graph also illustrates that heating load essentially becomes zero around 15°C, as opposed to 18°C, as assumed for the purposes of determining heating degree days in the model. This shows that the model should employ a balance point other than 18°C.

Figure 2 presents this latter point from a use per degree day perspective using load research data of actual customer heating demands. This figure is a plot of the average use per degree day arising from the sample. The research data indicates that use per degree day is close to constant when a balance point of 14.8 degree days is used. When 18°C is used to define the balance point, the results are not constant.

Figure 2
Heating Use per Degree Day vs Temperature

Note: Data based on a sample of Central Zone

These observations displayed in figure 1 and figure 2, which are derived from the actual monitored uses, illustrate that a balance point of 18°C is an incorrect assumption for the average heating response, and will therefore lead to a model that is not as accurate as it would be with a more appropriate balance point. This is because response is non-linear when referenced from 18°C.

These observations displayed in figure 1 and figure 2, which are derived from the actual monitored uses, illustrate that a balance point of 18°C is an incorrect assumption for the average heating response, and will therefore lead to a model that is not as accurate as it would be with a more appropriate balance point. This is because response is non-linear when referenced from 18°C.

5 Recommended Model Refinement

Based on the above observations, analysis was undertaken to develop a method that would yield a more linear relationship between consumption and degree days. This analysis resulted in a method whereby heating responsive degree days reflect the observed balance point in the Company's markets, yielding a near linear relationship between use and temperature. This method is referred to as the balance point methodology. A methodology was developed to implement this approach to the forecasting and normalizing processes of the Company. The proposed methodology does *not* change the Ontario Energy Board's approved weather forecasting methodology. It merely changes the assumed temperature at which heating load will be estimated to begin.

Heating Load Model Analysis

Balance Point Degree Days

The recommended refinement is called the balance point degree day method. This method uses historical customer billing data to calculate the correct balance point and the appropriate constant - the average use per degree day. The method is a simple iterative process where a regression of average use versus temperature below an assumed balance point is compared to another similar regression. The difference between the two regressions is that the assumed balance point is lower in one than the other. As the assumed balance point drops from 18°C, the relationship between heating load and temperature becomes more linear. When the relationship specified in the regressions begins to deteriorate, the balance point in that equation is then considered to be below optimal for the market and no further reductions are regressed. At this point the optimal balance point for the purposes of determining degree days has been found. The correct balance point is the balance point for the regression with the best fit.

Heating loads by weather zone were developed from analysis of historical customer billing data and compared to the recorded zone weather for the billing period. Significant differences in average balance points were found between the three Zones: Central, Eastern and Niagara. Table 1 lists the proposed balance points by Zone:

Table 1

Proposed Balance Points	
Zone	Balance Point
Central	14.8
Eastern	14.6
Niagara	15.3

These points are the weighted average balance points for the last five years. They will be reviewed annually and as long as the balance point remains within two standard errors (which is approximately ± 0.3 °C), no change to these balance points will be proposed in future applications. Only when the five year weighted average of a balance point falls outside this range will a change be proposed. This approach has been confirmed as stable and reasonable through historic analysis over time.

Average Use per Degree Day

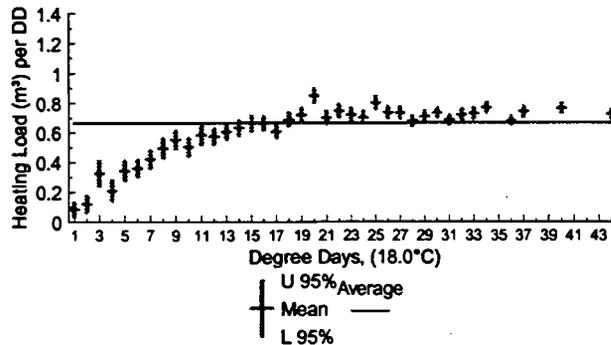

The development of average use per degree day is based on historical customer billing data. Annual heating use developed from customer billing data divided by incurred degree days derives the average use per degree day.

Heating Load Model Analysis

Figure 3 is a plot of average use per degree days versus degree days based on 18°C using customer sample data. The range between the upper and lower sample accuracy bounds at 95% confidence are indicated. The means are also indicated on this plot. This curved plot shows that when heating load is assumed to start at 18°C, a non-linear relationship exists between use per degree day and degree days. The average value is 0.66 m³ per degree day and is illustrated by the horizontal line. As can be seen, the constant, or average, will over estimate at some temperatures and under estimate at other. Such a relationship will cause estimating and normalizing problems unless it is taken into account in some other less statistical fashion.

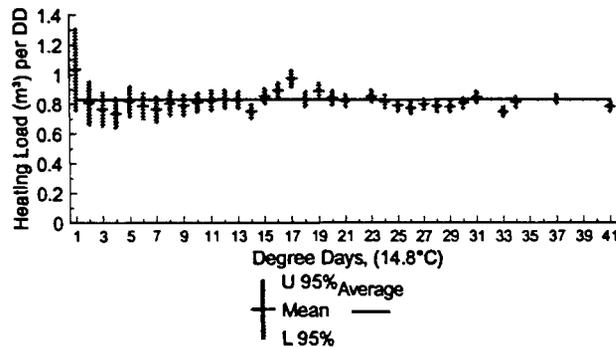

Figure 3
Use per Degree Days vs Degree Days
 (Degree Days base 18°C)

Note: Data based on a sample of Central Zone

Figure 4 is a similar plot to that of Figure 3. It is a plot of the observed relationship using customer sample data between use per degree days and degree days with the balance point method. In this plot the average is 0.83 m³ per degree day and is illustrated by the horizontal line. The plot indicates a near linear average use per degree day. The variations about the mean can be explained largely by: other weather factors, such as wind and sunshine, diversity of individual customer behaviour, and geographical relationship between the weather station and the customer. These factors are not explicitly taken into account by the model. Additional work is underway to expand the model to include other weather factors.

Figure 4
Use per Degree Days vs Degree Days
 (Degree Days base 14.8°C)

Note: Data based on a sample of Central Zone

Another factor that contributes to the variations is that the sample data employed in these figures covers the period from October 15, 1992 to January 19, 1994. As a result, for some temperatures there are few days to observe customer demands. Because of this, other factors play a larger role, for an average range of effects of the other factors is not available. However, the

Heating Load Model Analysis

improvement in relationship between average use and temperature is clearly observable when 14.8°C is used for the balance point.

By reducing the balance point, the number of degree days utilized to explain heating decreases. It is therefore axiomatic that by using the balance point approach, average use per degree days increases from that based on 18°C. This explains the increase in average use per degree days between the two methods illustrated in figure 3 and figure 4.

The effect of this is that, on days when the temperature is predicted to be 16°C or 17°C, no heating volumes are being estimated by the model. This is supported by the observations of Figure 1. It is equally true that when temperatures are very low, greater sales will be estimated. Figure 2 confirms that this is an appropriate relationship as well.

Weather Forecast

The Company's weather forecasting method is not being changed. The Company has found this method to be a good means for forecasting weather and the Ontario Energy Board has reviewed and approved the method in the past. The forecasted annual degree days developed from this method are base 18°C, and are developed consistently for each of the three zones. The proposed method applies the calculated balance points to the day-by-day degree day distribution throughout the year by zone that is developed from the approved forecast, and calculates the number of degree days falling below the respective balance points. This is performed by weather zone.

6 Testing the Balance Points

To test the reliability of the approach, that is the billing system analysis will produce reasonable balance points, load research sample data was analyzed to see if the average balance points developed from the billing data were statistically within the estimated range of the sample. Table 2 illustrates the results.

Table 2

Balance Point Test		
Zone	Billing Data	Sample Range
Central	14.7	14.4 - 15.2
Eastern	14.6	13.7 - 14.9
Niagara	14.8	14.3 - 15.4

The period for comparison in this test was January 1, 1993 to December 31, 1993 as opposed to the fiscal year of October 1, 1992 to September 30, 1993 which is a component year of the development

Heating Load Model Analysis

of the balance points presented in Table 1. The sample data indicated are the upper and lower accuracy bounds at 95% confidence. This means that the actual balance points of the heating markets will fall within these ranges determined from sampling 19 out of 20 times. This table shows that the billing analysis resulted in balance points within that sample range. Thus using billing data is a reasonable approach for determining balance points.

By comparing the sample range in Table 2 to the proposed balance points in Table 1, it can be seen that the balance points using a five year weighted average based on fiscal years is within the sample range from calendar 1993. This indicates that the five year weighted balance points calculated from billing data is a reasonable and stable means to calibrate the heating model.

7 Recommendations

It is recommended that the basic engineering model for determining heating load using an estimated 18°C as the point at which heating load begins be replaced with a statistically adjusted engineering model which calibrates balance points to the various heating markets by zone. The effects of doing so will be better forecasts and better normalizations. This is due to the fact that models calibrated to actual customer uses from billing data better reflect customers' behaviour.

The Company's current method for forecasting degree days based on an approved method by the Ontario Energy Board is to continue. That forecast is to be used to determine the number of degree days occurring at temperatures below the balance point, calibrated by zone for the forecast year, using a simple mathematical calculation.

Analysis should continue to develop a means to incorporate other factors such as other weather measures.

WRITTEN DIRECT TESTIMONY OF
CHRISTIE S. CLARK

Q.1 Please state your full name.

A.1 Christie Stephen Clark.

Q.2 What is your current position with the Company, your professional qualifications, experience, and previous appearances before this or other regulatory tribunals?

A.2 I am the Manager, Cost Analysis and Load Research. My curriculum vitae is filed at Exhibit A, Tab 19, Schedule 2, page 9.

Q.3 Mr. Clark, what is the purpose of this testimony?

A.3 I am presenting the Heating Load Model Analysis found at Exhibit C2, Tab 7, Schedule 1. This analysis modifies the traditional engineering based heating model that the Company has been using to reflect actual day by day observed heating behaviour from customer sample data. One of the significant results of this new model is the defining of a different "balance point", the point below which heating load begins to build. The "balance point" for each of the three weather zones is lower than the assumed 18°C currently used. This approach has been incorporated by Mr. Grant as explained in Exhibit C1, Tab 1, Schedule 1.

Q.4 Would you please explain what initiated this analysis?

A.4 The Company in the past has observed that in some situations movements in customer average uses, particularly on a per degree day basis, could not easily be explained. This raised issues in forecasting and normalizing load, as well as operational issues in distribution and gas supply. Such concerns will, in the future, affect DSM programme screening and evaluations.

The Board itself, in the EBRO 452 Decision with Reasons, dated December 21, 1988, paragraph 9.31, found that one of the components

that affects trends in average uses, conservation, had no sound analytical or statistical support. It directed the Company to do more work on end-use demand modelling.

In 1987, prior to that decision, the Company had in place a load research sample which was undertaken in order to provide insight into customer load behaviour. This sample was designed to enable the Company to better determine the relationship between end-use and other factors for operational and administrative improvements. Through such sampling, customers effectively tell the Company how they wish and when they wish to use the services offered by the Company.

That earlier load research sample led to additional samples and studies to further refine the original findings, and to better understand changes arising from marketing plans, including DSM initiatives.

Due to this pioneering research, which is still continuing today, the Company is in the position to further respond to the Board's directive with a significant improvement to the heating load model.

The results of such intensive research is a statistically adjusted engineering model which is explained in Exhibit C2, Tab 7, Schedule 1.

Q.5 The Heating Load Model Analysis recommends statistically calibrating the heating model to a market related balance point rather than use a traditional standard of 18°C. Would you please explain the genesis of 18°C?

A.5 Yes. The Company attempted to determine the basis for 18°C through literature reviews. All material found was based on work performed in the United States. Studies by Baltimore Gas & Electric (1925), the American Gas Association (1927), and the National District Heating Association (1932) found a balance point of 65°F, which soft converted to SI units is 18°C.

Those studies were done almost 70 years ago in different geographical areas of North America. Since then significant technological advances have led the Company to reexamine the appropriateness of 18°C as a base for determining heating response.

Q.6 Do other utilities use 18°C?

A.6 Most do, but there is a trend to move away from an arbitrarily set value of 18°C to a value developed using research of market responses to temperature. One utility that has moved is Ontario Hydro. In the United Sates three gas utilities that have moved to balance points other than 18°C for both operational and revenue forecasting purposes are: Columbia Gas of Columbus, Ohio; Consolidated Edison of New York, New York; and Pacific Gas and Electric of San Francisco, California.

Q.7 Does this change the Company's degree day forecasts which are founded on 18°C?

A.7 No. The forecasts are developed using three historical data series based on 18°C, one for each of the Company's zones. Such series do not exist for other balance points.

The Company's weather forecasts developed from degree days below 18°C are measures of expected coldness. However, only the degree days that fall below the proposed balance points for each of the zones will be used to project or explain heating load.

- Q.8 You state that the development of the proposed heating model is based on load research sampling. Please describe the sampling.
- A.8 The original findings were based on a sample designed to reflect the behaviour of the total residential heating market with and without other uses. End-use data was collected so that the heating load separate from the other base load appliances was determinable. This sample was designed to 95% confidence and 5% reliability on total customer load. That is to say, the true average load of all customers will be within 5% of the observed average load in the sample 19 out of 20 times.

Since that study, several other studies of the residential market to enhance development of management tools, for both operations and administration, have been undertaken. These studies further examine findings from the original sample, and examine the behaviour of certain appliances. These too have been designed to the 95% ± 5% standard.

The significant point from this sampling is that it enables the Company to now study actual customer demands and use the results of such studies to better serve customers, as opposed to the Company continuing to use broadly based and generally accepted 70 year old gas industry assumptions about heating response. That is, the customers are telling the Company what they want and when, in terms of service instead of the Company imposing industry standards.

** I have no further questions.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 3, pg. 24

Preamble:

On page 24, EGI evidence states: *Using the previous winter's (most recent) data is the most appropriate starting point for determining design day demand. This process closely follows the Union approach to determine design day demand. It ensures the most recent customer behaviour is incorporated into the design day demand. The previous winter's data reflects the myriad of factors which impact demand including demand side management, economic factors, customer behaviour, and energy efficiency.*

Question(s):

Does the use of only one year create variability in forecasted demand especially if a warmer than normal winter occurs? Please explain.

- a) Please provide the analysis that supports the use of one year vs. multiple years.
- b) Pages 26-28 show comparison figures and tables for the winters of 2018/2019 and 2021/22. Please provide the same figures and tables for the winters of 2019/2020 and 2020/2021.
 - i. Please provide the missing footnotes 23 and 24.

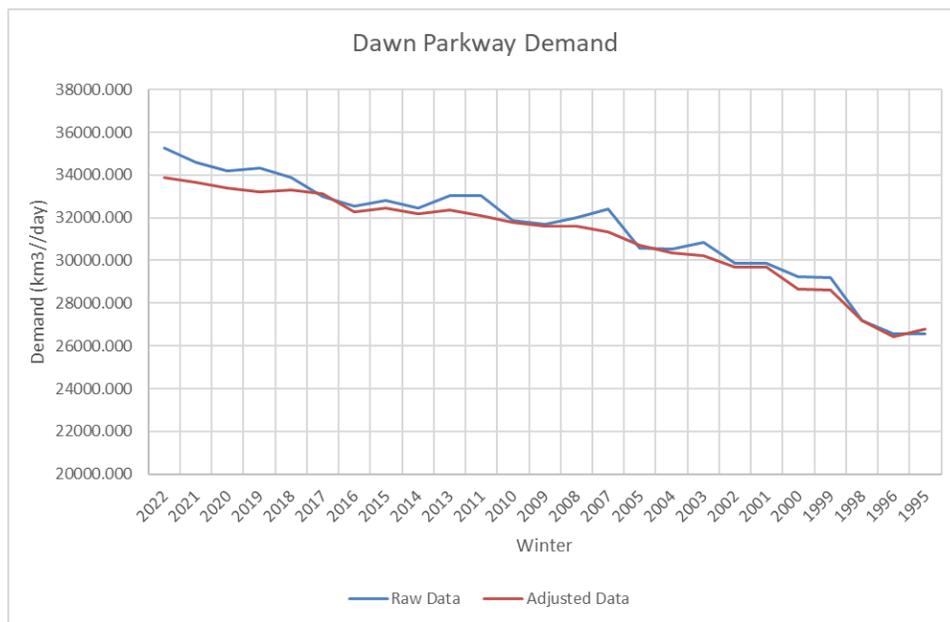

Response:

The design demand process uses the most recent winter's actual measured demand and HDDw as a starting point to determine the design day demand forecast. The previous winter's data captures the most recent customer demand trends including energy transition impacts. It is expected that the analysis from the current year is like that of the previous year and changes occur gradually from year to year. During each annual cycle, the newest analysis is compared to previous analyses to confirm the result of the analysis is similar and that any significant differences can be explained.

Using the same HDDw to extrapolate the analysis each year “normalizes” the analysis to minimize variability from year to year.

The proposed method incorporates the use per customer factor as provided at Exhibit 4, Tab 2, Schedule 3, paragraph 51, g) iii) and in footnote 18. This accepted method has been in place for about 20 years and was instituted to mitigate variability in the design day demand forecasts from year to year. The use per customer is calculated by dividing the general service demand by the number of customers. A rolling 20-year trend line shows the use per customer to decline over time. The adjustment factor is a ratio calculated by dividing the actual current year's use per customer by the value calculated for that year from the rolling 20-year trend line. The general service customer demand is multiplied by this adjustment factor to minimize the variability between forecasts. The impact on the variability is illustrated in Figure 1. The adjusted data shown by the red line has much less variability than the raw data shown by the blue line.

Figure 1: General Service Demand With and Without Use Per Customer Factor Adjustment

Warmer winters cause the data points in the linear regression to be concentrated to the lower HDDw area of the regression analysis. This increases uncertainty in the results as the extrapolation to the design day HDDw is increased. As stated previously, the analysis completed each year is compared to previous analysis to ensure the results are like the previous year's analysis and reasonable. If the analysis is deemed unusable, an engineering assessment would be made, and it could recommend keeping

some or all of the previous year's regression analysis intact and incorporating the Company's forecast changes that were materially different.

a) Please see Attachment 1 and 2.

Union completed an analysis to compare the results of using a rolling 5-year average demand to using a single winter adjusted by the use per customer factor. Union chose to use the single winter adjusted by the use per customer factor in the development of its design day demands.

b) Figures 2 to 5 provide the requested information for the Union South rate zone. Table 1 provides the requested information for the London weather station.

From: [Debevc, Melissa](#)
To: [Matt Wood](#)
Subject: Deferral Hearing - 5 year average vs. current year design day demands
Date: Sunday, October 20, 2013 7:42:00 PM
Attachments: [5 year rolling average vs use per customer factor.xlsx](#)

Hi Matt,

Attached is a simple spreadsheet which shows the general service design day demands for customers supplied from the Dawn to Parkway system over the past 5 years.

The Dawn to Parkway system total design day demand would be lower by approx 1.3 mmcf/d using a 5 year average instead of the current year. This represents approx 0.05 Degree day of volume on the system.

Over the past 5 years the largest difference occurred in Winter 08/09 where the design day vs. 5 year rolling average was 19.5 mmcf/d which equates to approx 0.5 degree day volume. This difference is very small.

The large urban centres near the GTA (Milton Oakville Burlington and Owen Sound) have been growing over the past 5 years.

What are the benefits of using a “rolling 5 year demand?” The answer is that this approach results in design day demands and a gas supply plan which vary less from year to year. There is a smoother transition from year to year.

Union’s Use per customer factor has a similar function as a rolling 5 year average. The approach smoothes the transition of demand from year to year.

Why is there variability in demand from year to year?

Weather variability can create issues with the data (more about this subject later in this document)

Why is this important? There may be issues with design day demands which vary up and down from year to year. Any approach used will result in variability from year to year however it is the magnitude of the change from year to year that would be of concern. Some issues that arise are when long term contracts or facilities are required and then suddenly not required due to variability in the demands. The company may have invested in facilities which are no longer required or over-contracted the gas supply plan.

Can the variability be removed from the design day demand calculation? The answer is NO. There will always be customer demand changes due to growth or decline in customers, energy efficiency and changes to the economy and weather volatility.

Can the variability be minimized? Certainly, Union uses a use per customer factor while another option is the “5 year rolling average”.

The real question is what amount of variability from year to year is acceptable?

Looking at Union South raw design data over the past 5 years, the annual variability is as follows:

Raw Data	2012/2013	2010/2011	2009/2010	2008/2009	2007/2008
Demand (km3/d)	31840	31825	30489	30608	30885
% change	.05%	4.2%	-0.4%	-0.9%	-1.5%

With the exception of Winter 10/11 the variability of the “raw” design day demand has varied by less than 1.5%. The 1.5 % represents approx 17 mmcf/d annually of the design day volume of general service customers.

Adding Union’s Use per customer factor to the data provides a smoother transition from year to year and did mitigate the large percentage change in Winter 10/11. The changes from year to year are less than 1.3%. Also note that with the exception of Winter 08/09 the demands have been increasing gradually. Also remember that the economic crisis occurred around that time.

Use Per Customer (Design)	2012/2013	2010/2011	2009/2010	2008/2009	2007/2008
Demand (km3/d)	31165	30879	30656	30892	30497
% change	0.9%	0.7%	-0.8%	1.3%	0.6%

The variability from year to year has evened out. There are no very large or very small changes with the largest being 1.3% difference. Is this reasonable? I would say yes having a design day demand which varies by less than 1.5% is very reasonable.

The question is “why would using a 5 year rolling average provide better results than current practice”

The answer is that it does not provide better results; Union’s approach is superior in theory.

Having an approach which uses current year volumes with a use per customer factor calculated over 20 years better reflect customer changes both increases and decreases due to increased number of houses, impacts of better energy efficiency and changes to the economy. The current year will also reflect the installation of new feeds and reinforcement to the systems which will change gas supply patterns.

The use per customer factor is simply the total demand divided by the number of customers. This value has been decreasing over the past 20 years. The factor adjusts the use per customer to this line. If the use per customer is higher, it is adjusted down to the line and vice versa. This prevents the design day demand from varying wildly from year to year while recognizing that there can be

growth of customers on the system.

Using a 5 year rolling average provides results which lag actual values by 2.5 years. This approach is overly simplistic and does not take into account up to date factors which impact design day demand values. For areas which are growing this approach will place the system at risk of not being able to supply the required demand. For areas experiencing declining growth this approach would result in an oversupply of gas and facilities the area or potentially having to plan reinforcement which may not be necessary.

Weather volatility can create issues when extrapolating data to design day conditions. Not having many cold days near design conditions adds a small level of error in the design day analysis. There is a “see – saw” phenomenon of the demands from year to year due to the weather volatility. The use of the Use per customer factor or the rolling 5 year average is to “average out” the weather volatility such that there is a more gradual increase or decrease over time. Measurement data from meters having orifice plates installed may also contribute to this impact.

What methods of analysis is Union using to mitigate some of the weather volatility and measurement issues?

- 1) The r-squared values for the data are always above 90% which indicates a very good data correlation and will result in a very good extrapolation to design day temperatures in the design process
- 2) Measurement errors are corrected or discarded from the analysis
- 3) To mitigate the weather volatility Union uses a use per customer factor rather than the rolling 5 year average. The use per customer factor is based on a 20 year rolling average.

Having a gas supply plan lagging by 2.5 years for areas which are growing would generate a smaller gas supply plan which may be a goal of some...however it may be a riskier plan as the gas supply plan may be behind actual customer usage or there could be capacity available to new customers.

5 year rolling average	2012/2013	2010/2011	2009/2010	2008/2009	2007/2008
Demand (km3/d)	31129	31029	30535	30340	30155
% change	0.3%	1.6%	0.6%	0.6%	0.6%
Difference in design values	-36 (1)	+150 (5)	-121 (4)	-552 (19)	-342 (12)

The 5 year rolling average produces results which vary the design day demand by up to 1.6% which is similar to the Union Use per Customer factor approach. This approach does result in lower demands 4 out of 5 years which is the result of the average lagging the customer growth by 2.5 years.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 3, pg. 29

Preamble:

EGL evidence states: *h) Daily demand is converted into design hour demand²⁷ ...
27 Using empirically derived profiles based on actual hourly flow data from the same
gate stations.*

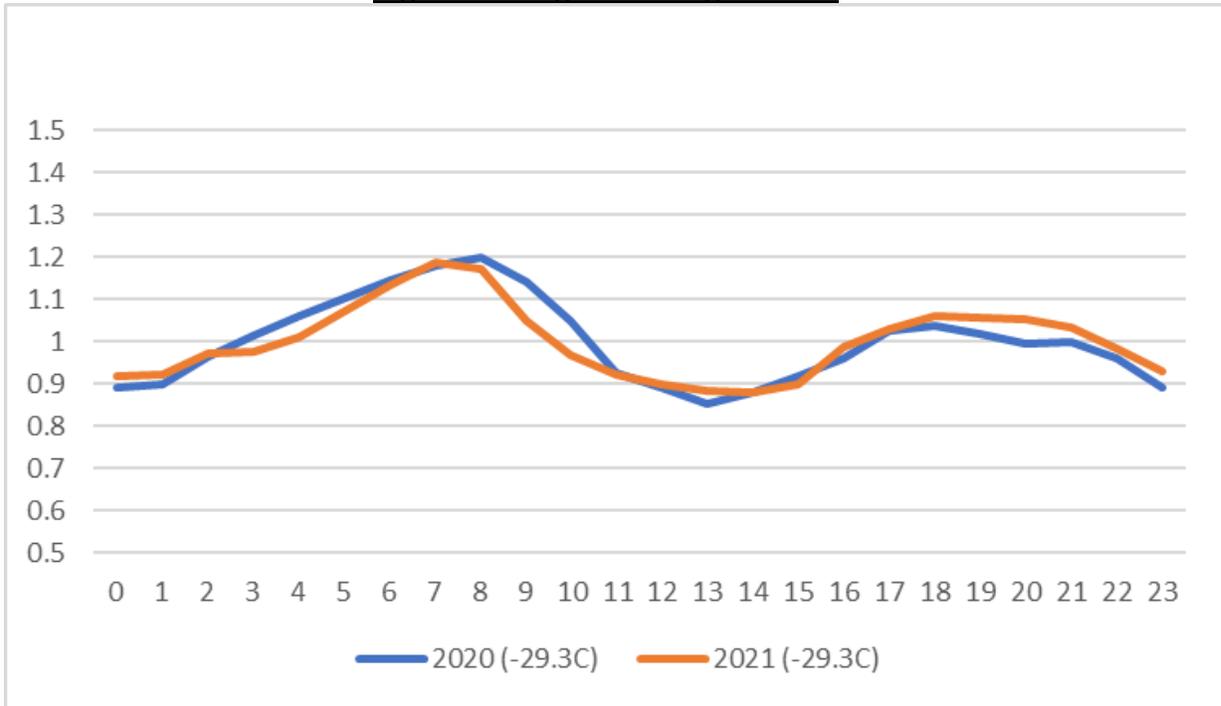

Question(s):

Please provide a full description of the methodology for the determination of the design hour demand using this process.

Response:

The daily demand is calculated as provided at Exhibit 4, Tab 2, Schedule 3, page 28, paragraph 59, a) - g). Individual customer hourly flow data is not available for the majority of Enbridge Gas customers and so a daily profile is not available. In order to determine a suitable peak hour for the customers on a given system the actual hourly gate station data captured through SCADA equipped stations on the same system is used to generate a dimensionless profile. A sample profile for the Kingston System is shown in Figure 1.

Figure 1: Kingston Design Profile

The dimensionless peak of that profile is then applied to the design day demand of each heat sensitive customer, not including process loads, to determine the peak hour demand of the customer.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 3, pg. 32-33

Preamble:

Table 3 shows that the proposed implementation increases the CDA design day demand by 2.9% and overall, by 0.4%. In spite of that increase, page 33 states: *As a result of the proposal of using the existing design hour process with the inclusion of the two Union refinements and the harmonized Company's demand forecasts, energy transition assumptions and interruptible curtailment processes, there are significantly less distribution facilities required to serve the design hour demand in the EGD rate zone.*

Question(s):

Please explain what factors that lead to a reduction in distribution facilities required to serve the design hour in the EGD rate zone.

Response:

The updates to the demand forecast methodology provided at Exhibit 4, Tab 2, Schedule 3, page 28, paragraph 59, had a decreasing effect on the design hour in the EGD rate zone as compared to the original methodology. This was further impacted when combined with the energy transition factors provided at Exhibit 1, Tab 10, Schedule 4. The combined process changes and inclusion of energy transition factors had a reducing effect in the growth projections and resulting demand. With growth also traditionally occurring at the extent of existing systems these reductions had a large effect on the proposed reinforcement needs as compared to the previous plan. As a result, several projects that were previously in the EGD rate zone were deferred or eliminated entirely resulting in the AMP reduction for distribution reinforcement projects in 2023, 2024, and 2025. Please see response at Exhibit I.1.10-STAFF-33 for more details on the impacts to the AMP.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 3, pg. 32-33

Preamble:

EGI evidence states: *As a result of the proposal to use the Union design day demand method, there are no incremental transmission or storage facilities required to serve the design day demand as the process was refined but did not materially change.*

Question(s):

Please clarify if the incremental demand is served by existing unutilized capacity from either transmission or storage.

- a) Please specify the component to meeting the net increase in EGD rate zone demand.

Response:

- a) Please see response at Exhibit I.4.2-STAFF-100 part c).

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 4 & EB-2022-0086 Decision and Order, page 15

Preamble:

We would like to understand more about EGI's proposal for operational contingency, how it is determined, and how it is proposed to be utilized and provide value for ratepayers.

Question(s):

For each of the respective storage locations of Dawn and Corunna, please provide the total space and total delivery for each of the following years (interpreted as the year including Nov. 1st of the winter season).

- a) 2007
- b) 2013
- c) 2018
- d) 2022
- e) 2024 (forecasted)

Response:

a-e) Please see Table 1 for the space and deliverability for the Union and EGD rate zones.

Table 1
Space and Deliverability

Line No.	Year	Space		Deliverability	
		Union (PJ) (a)	EGD (PJ) (1) (b)	Union (PJ/d) (c)	EGD (PJ/d) (2) (d)
1	2007	160	91 (1)	2.5	1.8 (2)
2	2013	169	105 (1)	3.2	2.0 (2)
3	2018	182	118	3.6	2.4
4	2022	187	128	3.9	2.6
5	2024	187	132	4.0	2.6

Notes:

- (1) Prior to MAADs Enbridge rate zone storage capacity was measured in Bcf.
- (2) Prior to MAADs Enbridge rate zone deliverability was measured in Bcfd

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 4 & EB-2022-0086 Decision and Order, page 15

Preamble:

Page 15 of the Dawn Corunna Pipeline Decision states: *The OEB agrees that Enbridge Gas has not provided any analysis from a post-amalgamation integrated storage system perspective and notes that Enbridge Gas will have an opportunity to do this in its rebasing application, if it seeks to include this project in rate base.*

Question(s):

Please provide the study that EGI has prepared to integrate the assets of the former Union Dawn and Enbridge Tecumseh to optimize asset utilization.

- a) If a study is not available, why has this not been completed?
 - i. In lieu of the study, please provide all studies, analysis or reports that inform operators of the integrated operation of the pools including injection/withdrawal schedules.

Response:

Please see Attachment 1. This documentation was prepared since the Dawn to Corunna Decision¹, to explain Enbridge Gas's review and consideration of the impacts and opportunities resulting from the integrated operation of the EGD and Union storage systems.

¹ EB-2022-0086.

Integrated Storage System Modelling and Analysis

1. Background

The intent of this document is to identify any “*Synergies from an Integrated Storage System*”. This was identified in the Decision and Order for the Dawn to Corunna Project¹.

There has been no formal report that has identified synergies of combining the integrated storage systems. Modeling was completed to identify any synergies. Additionally, the models were utilized to identify unregulated opportunities to expand deliverability by investing in additional facilities.

2. Storage Capacity

The storage space associated with the Enbridge Gas storage pools is allocated to three categories: Union rate zone, EGD rate zone and Enbridge Gas unregulated.

Table 1
Enbridge Gas Storage Capacity

	Space (PJ)
Union rate zone	100.0
EGD rate zone (1)	99.4
EGI unregulated (2)	119.3

Notes:

(1) Does not include the Crowland storage pool

(2) Includes unregulated storage space owned by Union Gas Limited, Enbridge Gas Distribution, Market Hub Partners Canada and Sarnia Airport Storage Pool (Excludes 50% owned by Alta Gas)

The Enbridge Gas storage system contains 35 storage pools. Each storage pool has a unique storage capacity. Operating the storage pools as part of a network does not impact the capacity of the individual storage pools. Therefore, the integration of the two legacy storage networks did not create any additional storage space. Incremental storage capacity can only be created by investing capital to construct additional facilities.

3. Design Day Deliverability

The basis for determining the amount of deliverability available for each year is based on the annual design day analysis. Upon integration, Enbridge Gas proceeded to create a common process to compare design day flows between the two systems. The initial step in this process was to create an EGD design day analysis using the principles of the Union design day analysis. The process to build the separate EGD design day model and subsequently create the combined designed day model is discussed in Appendix A (History of Hydraulic Modelling). In addition to confirming the Union facilities in the new model, a comparison was also completed in 2022 for the total deliverability of separate and combined models. The results of this analysis are summarized in Table 2.

¹ EB-2002-0086, Decision and Order, page 13.

Table 2
Comparison Between Separate and Combined Models

	Baseline		Combined Model		Difference	
	Deliverability	Inventory	Deliverability	Inventory	Deliverability	Inventory
	MMscfd	MMscf	MMscfd	MMscf	MMscfd	MMscf
Union	3,484	83,644	3,470	83,644	-14	0
EGD	2,184	73,233	2,185	73,233	1	0
Totals	5,668	156,877	5,655	156,877	-13	0

The combined designed analysis concluded that that the integration of the two storage systems into one did not create any incremental design day deliverability. The integration of the storage systems did not create incremental deliverability because the existing facilities are fully utilized. Incremental design day deliverability can be created by investing capital to construct additional facilities.

Since the Natural Gas Electricity Interface Review (NGEIR)², the Design Day model for the Union rate zone storage was utilized to determine the maximum amount deliverability available. To date, the utility customers have been allocated all the deliverability that they require regardless of the cost allocation to utility customers. This is proposed to be addressed in the 2024-2028 Rebasing Application. Any deliverability above the requirements of the utility customers has been made available for non-utility customers. The unregulated business has also invested significant capital to expand the capabilities of the system to create additional deliverability and space.

At NGEIR, 100% of the EGD system was reserved for utility customers. This included 91.3 Bcf of space and 1,740 MMscfd of deliverability. Since NGEIR, the unregulated business has developed both deliverability and storage space. Following the MAADs decision, a design day model was created for the EGD rate zone. Like Union rate zone, this model has been utilized to determine the maximum amount of deliverability from the storage system. EGD rate zone utility customers are allocated 1.9 PJ (1.7 Bcf converted to PJ at MAADs) of deliverability. Any deliverability above this amount is made available to the unregulated business.

Since integration, Enbridge Gas has developed a combined model to evaluate the combined capability of the storage system. The combination of the systems has not created any incremental space or deliverability since the separate systems were operating at maximum capability and fully utilizing all available facilities.

4. Deliverability Projects Since MAADs

As part of 2021/2022 Storage Enhancement Project³, Enbridge Gas received approval from the OEB to (amongst other items) to:

- re-route approximately 150 m of the NPS 20 Ladysmith transmission pipeline to connect the Payne pipeline and the Ladysmith pipeline within the existing Kimball-Payne Station;

² EB-2005-0551, OEB Decision and Order, November 7, 2006.

³ EB-2020-0256.

- install 2.2 km of NPS 24 steel pipeline to connect the Payne Compressor Station to the Corunna Compressor Station; and
- drill a horizontal gas storage well (TL 9H) in the Ladysmith Storage Pool.

The combination of these facilities increased the design day deliverability by 8,100 10³m³ (317 TJ/d). This project increased the non-utility deliverability by investing capital to create two additional connection points between the storage systems. These facilities allow the Payne pool to be filled and emptied through the Corunna Compressor Station and allows the Ladysmith pool to flow directly to the Dawn Compressor station by utilizing the NPS 20 Payne Pool pipeline.

5. Operational Flexibility

The integration of the storage systems has generated additional flexibility from an operations perspective. By utilizing both systems to manage operation requirements, inventories can be injected or withdrawn with additional flexibility. This allows the Company to better manage outages that are required to complete construction and maintenance activities. As an example of additional flexibility, during 2021 and 2022 Enbridge Gas completed the Corunna Meter Run Replacement project at the Corunna Compressor Station. The project modernized the Corunna Compressor Station yard by removing piping and above ground meter runs that were no longer needed and replaced them with a series of headers and valving that provides increased operability, safety and reliability to the system.

The construction was completed by isolating the whole yard for a six week period at the beginning of each construction season. Within the six weeks, a portion of the yard was isolated for the construction and the remaining yard was returned to service. At the end of the construction season the process was reversed.

During the yard outages, there was no activity at the EGD rate zone pools connected to the Corunna Compressor Station. Prior to the amalgamation, EGD would have had to purchase services from Union to facilitate the outages. Since amalgamation Enbridge Gas has been able to use the combined storage assets to integrate these types of outages into the overall storage operations.

6. Conclusion

The integration of the EGD rate zone and Union rate zone storage systems did not create any additional space or design day deliverability. This is primarily because the deliverability from the existing system is maximized and all facilities are fully utilized. There will be opportunities to expand the deliverability and storage capacity of the system as demonstrated in the 2021/2022 Storage Enhancement Project. Additionally, Operations has been able to utilize the additional flexibility of the entire system (including line pack) to plan injections and withdrawals in the most efficient manner to manage system outages.

Appendix A
History of Hydraulic Modelling at Enbridge Gas

This document is meant to summarize the history of the implementation of the combined hydraulic design day model used to model Enbridge Gas's natural gas storage system.

Pre-2018

- Union Gas began using hydraulic modelling in the 1980's. The Design Day model was often referred to as the "Dawn Peaks" model.
- EGD developed a new hydraulic model of its gas storage system and compressor station facilities around 2016.

2018

- MAADs Decision and Order from OEB (EB-2017-0306 and EB-2017-0307).
- Utility merges and maintains separate rate zones.
- Utilized Union rate zone methodology to create EGD design day model and associated analysis for W17/18 and W18/19.
- This was the initial Design Day analysis completed for the EGD rate in relation the storage system. This also created a baseline (pre-integration) model. The assumptions in this model did not consider any possible benefits from integration. It was created to model the EGD system separate from the Union system up to the interconnection points.

2019

- The Design Day model for the Union and EGD rate zones remained the same (other than annual updates).
- Results from the EGD Design Day analysis were used as inputs to the Union Design Day analysis.
- Work was initiated to build a combined Design Day model of entire Enbridge Gas storage system.

2020

- Continued to run Design Day model for the Union and EGD rate zones separately.
- A new combined model was created for the entire Enbridge Gas storage system. This extended the philosophy created for the EGD model across the entire storage network. The Enbridge Gas combined model included a rebuild of the Union model.
 - The combined model was created by adding the Union facilities to the EGD model.
 - The combined model was spatially accurate and eliminated equivalent lengths utilized in the previous Union model.
 - Station facilities were more accurately reflected with piping and components.
 - Additional piping in the Dawn yard was included in the new model.
 - Delivery pressure set points between the EGD and Union systems at Dawn were eliminated. With the elimination of the pressure set point between the two separate models, this enabled harnessing full system, end-to-end dynamics

compared to having a defined pipeline delivery pressure at the interface point between the two separate models.

- Analysis to compare the separate models versus the Enbridge Gas combined model.
 - In late 2020, the combined storage network model was functional and ready to be tested to ensure alignment with the results of the accepted modeling process using the two separate models.
 - For the separate models, the results from the EGD model were used as inputs to the Union model. This is consistent with the methodology applied prior to integration since the EGD and Union storage systems are only connected at Dawn.
 - As the combined model was built by adding the Union facilities into the EGD model, the analysis looked at the combined model predictions of the Union facilities only; as the EGD facilities were unchanged.
 - The W23/24 model was chosen for the detailed comparison
 - The total flow from the DAWN Peaks model = 3,558.1 MMscfd
 - The total flow of the same facilities in the combined model = 3,533.4 MMscfd
 - Total difference 24.7 MMscfd or 0.7% between the models.
 - See the Table 1 for a comparison of inventories and flows
 - This final difference is deemed to be well within accuracy limits (i.e., confidence intervals) of the model's basic input parameters (e.g., empirically derived Storage field performance parameters). Therefore, the combined model accurately models Enbridge Gas' integrated system.

2021

- Based on the above-described model comparison exercise, and prior to completing the 2021 design day analysis Enbridge Gas made the decision to utilize the new combined model as the official model going forward.

Appendix B
Comparison of Inventories and Flows for Union rate zone Storage Pools

Name	Separate	Combined	Difference	Separate	Combined	Difference
	Inventory (MMscf)	Inventory (MMscf)		Flow (MMscfd)	Flow (MMscfd)	
Airport	1,664	1,664	0	26.9	25.9	1

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 4 & EB-2022-0086 Decision and Order, page 15

Preamble:

Page 15 of the Dawn Corunna Pipeline Decision states: *The OEB agrees that Enbridge Gas has not provided any analysis from a post-amalgamation integrated storage system perspective and notes that Enbridge Gas will have an opportunity to do this in its rebasing application, if it seeks to include this project in rate base.*

Question(s):

Referring to the 4PJ of empty space for the fall injection season, what is the empty space used for after withdrawals have started?

- a) How is the filled space used after injections started?
 - i. If it is not filled, why not?

Response:

The 4 PJ of space is used to support the injection operations. Specifically, the 4 PJ of empty space is utilized to mitigate risks associated with forecasted weather variances, storage pool factors, and OBA imbalances. The 4 PJ of space remains empty after withdrawals start.

- a) The filled space remains full after injections start.
 - i. Please see response to part a).

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 4 & EB-2022-0086 Decision and Order, page 15

Preamble:

Page 15 of the Dawn Corunna Pipeline Decision states: *The OEB agrees that Enbridge Gas has not provided any analysis from a post-amalgamation integrated storage system perspective and notes that Enbridge Gas will have an opportunity to do this in its rebasing application, if it seeks to include this project in rate base.*

Question(s):

Please provide the study that determined the 43.5PJ of storage was required for deliverability.

- a) How was that storage space and molecule cost recovered in rates subsequent to the increase to 43.5PJ?
- b) Please provide the Board approval for those cost allocations and recovery.

Response:

As noted in the Dawn to Corunna Replacement Project proceeding:

Utility customers have a maximum storage inventory of 99.4 PJ. 43.5 PJ is the level of inventory beyond which deliverability from the storage assets begins to decline. As a result, Enbridge Gas plans to hold a minimum of 43.5 PJ of inventory until the end of February in order to ensure that deliverability of 1.9 PJ/d is available to meet design day demands, which are assumed to occur prior to March 1 annually. After March 1, the Company plans to withdraw gas from storage.

Planning to hold the utility customers' storage balance to a minimum of 43.5 PJ until the end of February was not determined using an internal study. This approach was instituted in response to winter 2013/14 (i.e., the polar vortex winter) as a strategy to increase the flexibility of the EGD rate zone portfolio of assets by reducing the reliance utility customers have on potentially costly Dawn spot purchases late in the

winter season during prolonged cold winters.¹

- a) In the EGD rate zone, costs classified as storage space are allocated to the rate classes in proportion to average winter demand in excess of average annual demand and recovered through the Company's delivery rates. The 43.5 PJ of gas molecules is recorded as gas in storage inventory, a component of rate base working capital. Return on gas in inventory is allocated to the rate classes in the same proportion as storage space and recovered through the Company's delivery rates. The cost of molecules held as gas in storage are classified as gas supply commodity and allocated to the rate classes on sales volumes. The costs are recovered from sales service customers through the gas supply commodity rate when consumed.
- b) The OEB last approved the updated annual gas supply plan as well as annual gas storage volume requirements and related rate base gas in storage values and any gas related working cash allowance in EGD's 2018 Rates proceeding². The EGD Cost Allocation Study, which used the allocation methodologies provided at part a), was also last approved by the OEB in the 2018 Rates proceeding³.

Ex. 4, Tab 2, Schedule 4 & EB-2022-0086 Decision and Order, page 15

Preamble:

Page 15 of the Dawn Corunna Pipeline Decision states: *The OEB agrees that Enbridge Gas has not provided any analysis from a post-amalgamation integrated storage system perspective and notes that Enbridge Gas will have an opportunity to do this in its rebasing application, if it seeks to include this project in rate base.*

Question(s):

If not provided above, please provide the source of the 13.5PJ of space and molecules determination.

a) How are the costs of the molecules allocated and recovered?

Response:

Please see Exhibit 4, Tab 2, Schedule 4, page 3, paragraph 7 for details of the 13.5 PJ for the EGD rate zone. The 4 PJ of empty space is an operational practice to manage the system and the 9.5 PJ of molecules is an output from the Gas Supply Plan.

a) The cost of the gas molecules for the 9.5 PJ of gas in storage for the EGD rate zone is recorded as gas in storage inventory, a component of rate base working capital. The cost of molecules held as gas in storage are recovered from sales service customers when consumed.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 4 & EB-2022-0086 Decision and Order, page 15

Preamble:

EGL evidence states: *The total EGD and Union rate zone space available for operational contingency for Winter 2023/2024 is 23 PJ.*

Question(s):

Please provide the EGL study which assesses the combined capability of Dawn and Corunna.

- a) If no study is available, how did EGL determine the 23 PJ?
 - i. If it is a simple sum, please explain why EGL has not studied how these assets could be used more efficiently.
 - ii. Please provide the determination of the individual components.
- b) If those documents are not available, please provide the results of simulations, analysis or other technical determinations of the components requested for operational contingency.
- c) Please indicate the amount of deliverability allocated to the contingency space and how it is developed using the components described.

Response:

Enbridge Gas performs a design day analysis to assess the total capability of the storage system. To complete this analysis, Enbridge Gas has developed a hydraulic model of the entire storage system that is used in the company's storage design day analysis. Please see response at Exhibit I.4.2-FRPO-131 for a description of the model utilized to determine the components of operational contingency. Based on the results of the Winter 2023/2024 design day analysis, the total combined capability of the storage system is 6.6 PJ.

- a) Please see Exhibit 4, Tab 2, Schedule 4, pages 3, paragraphs 6 to 8 for an explanation of the existing operational contingency. For the Winter 2023/2024, the Union rate zones have 9.5 PJ of operational contingency, which was approved by the OEB in Union's 2013 Cost of Service Application¹. The EGD rate zone managed operational contingency differently by utilizing injection and withdrawal targets to ensure the required space and molecules were available for operational contingency purposes. For the Winter 2023/2024, the EGD rate zone has 13.5 PJ of operational contingency available. The 23 PJ was derived by adding the 9.5 PJ of operational contingency from the Union rate zones and the 13.5 PJ of operational contingency from the EGD rate zone. Enbridge Gas is not requesting approval for 23 PJ of operational contingency. As provided at Exhibit 4, Tab 2, Schedule 4, page 4, paragraph 10, Enbridge Gas is requesting approval for 15.6 PJ of operational contingency in this Application.
- i. The 23 PJ is a simple sum of the current EGD and Union rate zones operational contingency, however, Enbridge Gas is not requesting approval for 23 PJ of operational contingency as part of this Application. Enbridge Gas utilized a model to determine the total amount of operational contingency available. As a result of utilizing the model, the total amount of operational contingency required was reduced from 23 PJ to 15.6 PJ (Exhibit 4, Tab 2, Schedule 4, page 7, paragraph 20).
- ii. The individual components of the 15.6 PJ of operational contingency are provided at Exhibit 4, Tab 2, Schedule 4, page 4, Table 3.
- b) Please see response at Exhibit I.4.2-FRPO-131 for a description of the model utilized to determine the components of operational contingency.
- c) Enbridge Gas does not specifically allocate any deliverability to operational contingency.

¹ EB-2011-0210.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 4 & EB-2022-0086 Decision and Order, page 15

Preamble:

EGL evidence states: *Each component is modeled separately to determine the total operation contingency requirements.*

Question(s):

Please file the analysis and models that determined the specific components in Table 3.

- a) Please file the summary recommendations that went through the senior management approval process to support this approach.
- b) If these component values were determined independently, please explain why some of the space could not be used for multiple purposes if it is unlikely to have coincident occurrences?
 - i. Please explain why storage space left open in the fall could not be filled on a planned basis in December to form part of the withdrawal contingency for the spring.
- c) If events do not occur at the same time, why does one need to sum the contingencies?
 - i. Please show the need assessment in a presentation, such as a Venn diagram.

Response:

The operational contingency model is a series of spreadsheets that utilizes @Risk software. Without the software, it is not possible to provide the spreadsheets. Enbridge Gas has prepared a description of the model inputs and results included as Attachment 1.

- a) Please see Attachment 2 for a presentation made to Enbridge Gas management explaining and seeking endorsement of the proposed change to operational contingency space. After this presentation was made in April 2022, some edits were made to reflect the change in terminology from “system integrity” to “operational contingency”. The changes are reflected in the updated version of the presentation found at Attachment 2.
- b) The operational contingency model determined that the total operational contingency required is 28.2 PJ if each component was calculated independently. The model subsequently considers that all components will not occur at the same time and reduced the amount of operational contingency to 15.6 PJ.
- i. Filling the storage space left open in the fall during December would require additional gas supply purchases that are not required.
- c) Please see response at part b).
- i. Please see Table 1.

Table 1
Operational Contingency

Line No.	Component	<u>Independent Components</u>			<u>2024 Proposed</u>		
		Space (PJ)	Mol. (PJ)	Total (PJ)	Space (PJ)	Mol. (PJ)	Total (PJ)
		(a)	(b)	(c)	(d)	(e)	(f)
1	Weather	4.7	9.7	14.4	2.9	5.0	7.9
2	Line Pack	0.0	2.5	2.5	0.0	1.3	1.3
3	Reservoir Factors	2.1	7.0	9.1	1.3	3.5	4.8
4	OBA	1.5	0.7	2.18	0.7	0.9	1.6
5	Total	8.3	19.9	28.2	4.9	10.7	15.6

OPERATIONAL CONTINGENCY MODEL

Operational contingency can be broken up into empty space on November 1 to manage late season injections (“Space”) and filled space (“Molecules”) for winter operation requirements.

The operation contingency model is a Monte Carlo simulation utilized to determine the amount of operational contingency required for Enbridge Gas. The model considers the four components listed below and calculates the amount of empty space and molecules required for reliability and resilience of the Enbridge Gas system.

1. Weather,
2. Line Pack,
3. Reservoir Factors, and
4. OBA

1.0 WEATHER

1.1 Weather (Molecules)

Daily gas nominations are based upon a weather forecast prepared prior to the beginning of the gas day. Weather that is colder than forecasted requires incremental withdrawals from storage.

Data between 2001 and 2021 was analyzed for Union North and Union South rate zones, and between 2005 and 2021 for EGD rate zone. November through March data was used for the winter molecule calculation. For each rate zone the following temperature data was analyzed:

Union North

1. Sault Ste. Marie;
2. Sudbury;
3. Muskoka;
4. International Falls;
5. Thunder Bay; and
6. Kingston

Union South

1. London

EGD Rate Zone,

1. Toronto; and
2. Ottawa

Once the temperature variance was known for each rate zone, an average temperature variance for each rate zone was calculated and converted from temperature to space using the following factors:

1. Union North – 8 TJ/HDD;
2. Union South – 34 TJ/HDD; and
3. EGD Rate Zone – 78 TJ/HDD,

Actual and forecasted weather data collected indicates that maximum temperature variances for Union North, Union South and EGD rate zones are 3.9 HDD, 3.3 HDD and 3.2 HDD, respectively. /u
The operational contingency space to offset this potential error in HDD is 0.9 PJ, 3.0 PJ and 5.8 PJ. /u

1.2 Weather (Space)

For the space calculation the final 10 days of the injection season were analyzed. Data between 2000 and 2021 was analyzed for both Union North, Union South, and EGD rate zones.

The analysis uses the actual observed HDD data to determine the average HDD and variance from the average. Similar to the molecule calculation, the space calculation converts from temperature to space by,

1. Union North Rate Zone – 8 TJ/HDD;
2. Union South Rate Zone – 34 TJ/HDD; and
3. EGD Rate Zone – 78 TJ/HDD.

Results are as follows,

Rate Zone	HDD Variance	Space (PJ)
Union North	35.5	0.3
Union South	38.4	1.3
EGD	38.7	3.0

2.0 LINE PACK (Molecules)

Swings in system line pack due to unexpected outages and unplanned system demands may result in the necessity to withdraw from storage to replenish line pack. For the Dawn Parkway System, actual daily line pack values recorded from 2006 to 2021 were used for the analysis. Only data between November and March was used as part of the analysis. For the remaining Union and EGD transmission and distribution systems, a detailed history is not available therefore it was assumed that line pack in these systems can vary +/- 7.5%.

The Union transmission systems included in this analysis include:

- Dawn to Parkway Lines;
- St. Clair Pipeline;
- Bluewater Pipeline;
- Sarnia Industrial Line; and
- Panhandle line.

Results are as follows,

Rate Zone	Space (PJ)	Molecule (PJ)
Union North	-	0.0
Union South	-	2.4
EGD	-	0.05

/u

Of the total line pack, 91% is attributed to the Dawn to Parkway System, 8% to the remaining Union rate zones assets and 1% to the EGD rate zone.

/u
/u

3.0 RESERVOIR FACTORS (Space/Molecules)

For the 2024 rate case, hysteresis has been renamed to “Reservoir Factors”. Reservoir factors is a combination of:

1. Storage pool variance;
2. Storage pool deliverability coefficients; and
3. Storage pool hysteresis.

3.1 Storage Pool Variances

Twice annually, storage pools within the Enbridge Gas system are placed on stabilization to allow pressure to equalize across the reservoir. Pressure and flow data from each reservoir is used to complete material balance inventory analysis on all Enbridge Gas storage reservoirs. Based upon the results of this analysis there is a known variance between measured and calculated inventory. This factor has been included to account for potential changes in the variance throughout the operation season and specifically between stabilization periods.

Data between 2016 and 2021 was used for the storage pool variance calculation. In order to improve the accuracy of storage pool measurement, EGD constructed new storage measurement facilities between 2012 and 2013. In 2017, EGD completed an inventory study and as a result completed several storage inventory adjustments. As part of the 2017 inventory study, the reservoir sizes were adjusted. This also means that variance calculations prior to 2017 would have been inaccurate. It was felt that including earlier data would unnecessarily inflate the amount of operational contingency required.

Fall variances have been observed to vary between 3.1 PJ to 5.2 PJ, and spring variances have been observed to vary between -0.2 PJ to +4.2 PJ.

3.2 Storage Pool Deliverability Coefficients

Total system deliverability is determined utilizing a hydraulic model that includes inputs to characterize many aspects of the storage system. The primary factor in modeling storage pool flow performance is the deliverability coefficients for each storage pool. These coefficients are known to vary from day to day, season to season and year to year.

The most recent five years of deliverability testing history was analyzed, and it was found that total system deliverability can vary +/- 1.9%. To mitigate the risk of inaccurate deliverability coefficients resulting in lower than expected design day deliverability, 3.3 PJ of operation contingency is required for Enbridge Gas.

3.3 Storage Pool Hysteresis

Storage pool deliverability performance can be influenced by localized pressure drawdown across the reservoir resulting from withdrawal and injection operations. The reduction in the effective reservoir pressure resulting from this drawdown is referred to as hysteresis. Lower effective reservoir pressure results in lower deliverability performance from storage. The model assumes that hysteresis can vary +/- 70 kPa from expected. As a result of hysteresis, 0.3 PJ of space is required for both Enbridge Gas.

Reservoir Factor Results are as follows:

	Space (PJ)			Molecules (PJ)		
	Pool Variance	Deliverability Coefficients	Hysteresis	Pool Variance	Deliverability Coefficients	Hysteresis
Union North	-	-	-	-	-	-
Union South	1.2	-	0.2	2.0	3.3	0.3
EGD	1.2	-	0.2	2.0	3.3	0.3
Total	2.4	0.0	0.4	4.0	6.6	0.6

As mentioned at Exhibit 4 Tab 2, Schedule 4, page 4, paragraph 9 “The operation contingency model accounts for the fact that events related to the operational contingency will not all occur at the same time, thus reducing the total operational contingency requirement”. Based upon this:

Rate Zone	Space (PJ)	Molecules (PJ)
Union North	-	-
Union South	1.1	3.3
EGD	1.2	3.3
Total	2.3	6.6

Accounting for the fact that events related to the operational contingency will not all occur at the same time, the reservoir factor is reduced from 14 PJ to 6.6 PJ.

4.0 OBA (Space/Molecules)

OBA imbalances occur daily at various delivery and receipt points at pipeline interconnects on the Enbridge Gas system. To the extent that the OBA imbalances draft EGI’s system on any given day, an equivalent volume from storage is required to balance supplies and demands on the system.

Daily OBA balances for the Union rate zone between 2014 and 2022 and for EGD rate zone between 2015 and 2022 were utilized in the model. OBA between Union and EGD were excluded from the analysis to ensure that this data would not inflate the amount of operational contingency required. For the space calculation OBA data from October and November was used, and for the molecule calculation, data in March and April was used.

The following OBA receipt data was included in the analysis:

Union South	Vector, Panhandle Eastern (PEPL), Bluewater Pipeline, Michcon, and TCE
EGD	ANR LINK, Parkway, Dawn, Greenfield South

Results are as follows:

Rate Zone	Space (PJ)	Molecule (PJ)
Union North	-	-
Union South	1.5	0.6
EGD	0.03	0.02

/u

5.0 Discussion on Results

As mentioned in Exhibit 4 Tab 2, Schedule 4 Pg 4 Paragraph 9 “The operation contingency model accounts for the fact that events related to the operational contingency will not all occur at the same time, thus reducing the total operational contingency requirement”. Based upon this, the results listed above has been prorated to eliminate the concurrent occurrence of all factors.

Space

	Union North (PJ)	Union South (PJ)	EGD (PJ)	Total (PJ)	Diversified (PJ)
Weather	0.3	1.3	3.0	4.6	2.9
Line Pack	-	-	-	-	0.0
Reservoir	-	1.1	1.2	2.3	1.3
OBA	-	1.5	0.03	1.5	0.7
Total	0.3	3.9	4.2	8.4	4.8

Molecule

	Union North (PJ)	Union South (PJ)	EGD (PJ)	Total (PJ)	Diversified (PJ)
Weather	0.9	3.0	5.8	9.7	5.0
Line Pack	0	2.4	0.1	2.5	1.3
Reservoir	0	3.3	3.3	6.7	3.5
OBA	0	0.6	0.02	0.6	0.9
Total	0.5	9.3	4.6	19.5	10.8

/u

The model considers the likelihood of individual factors occurring concurrently and the amount of required contingency for each factor is prorated. For example, the individual weather risk at the end of the injection season is 4.6 PJ, however once concurrent occurrences across all factors are removed, only 2.9 PJ of weather space is required.

Without consideration for the fact that events related to the operational contingency will not all occur at the same time 28 PJ of operation contingency would be required. With consideration for the fact that events related to the operational contingency will not all occur at the same time, the total operational contingency required for Enbridge Gas is reduced to 15.6 PJ.

Operational Contingency 2024 Rebasing

Confidential

April 2022
Updated January 2023

Safety moment

Visa fraud

- On-line shopping
 - It's easy and convenient to shop on-line when you have your visa card saved in your account profile at various stores
- HOWEVER
 - If that account gets hacked, items can be purchased and paid for with your credit card instantly for a convenient in-store pickup
- Signs to watch out for
 - Check your visa statements regularly (bank app notifications)
 - Watch increased volume of junk mail
- Prevention
 - Do not “save” your credit card for a quick checkout
 - Use complicated passwords for on-line shopping accounts
 - Update passwords on regular basis

Never save your visa number for a quicker on-line checkout.

Operational Contingency

As an integrated storage and transmission system operator operational contingency space is required to support the integrity of the system and provide the provision of service to all customers. It provides the reserve capacity and operational balancing necessary to manage all the services offered and ensures the integrity of the storage, transmission and distribution systems.

- Operational contingency is calculated based upon 6 separate factors,
 1. Weather,
 2. UFG,
 3. Line Pack,
 4. Hysteresis,
 5. OBA/LBA, and
 6. Gas Supply

(pre 1999 – 10.4 BCF, 1999 – 9.1 PJ, 2005 – 9.7 PJ, 2011 COS – 9.5 PJ)

2024 Update

- Identical process to previous filings for,
 - Weather,
 - Line Pack,
 - OBA/LBA
- Hysteresis changed to “Reservoir Factors”,
 - Reservoir Factors include risk for Storage Unknowns,
 - Inventory Variances,
 - Deliverability Coefficients, and
 - Hysteresis,
- Gas Supply factor removed,
- UFG removed,
- Data for EGD rate zone incorporated into model

Operational Contingency Summary

	Union EB-2011-0210	EGD ⁽²⁾ Operational	Proposed (PJ)
Space	3.5	4.0	4.8
Molecule	6.0	Up to 21.6 ⁽¹⁾	10.8
Total	9.5	25.6	15.6

- (1) Gas supply plan current Mar 31 – EGD 21.6 PJ and Union 6.0 PJ
Gas supply plan current Apr 30 – EGD 11 PJ and Union >= 6.0 PJ
- (2) EGD does not currently have approved operational contingency. Operational planning replicates the operational contingency concept.

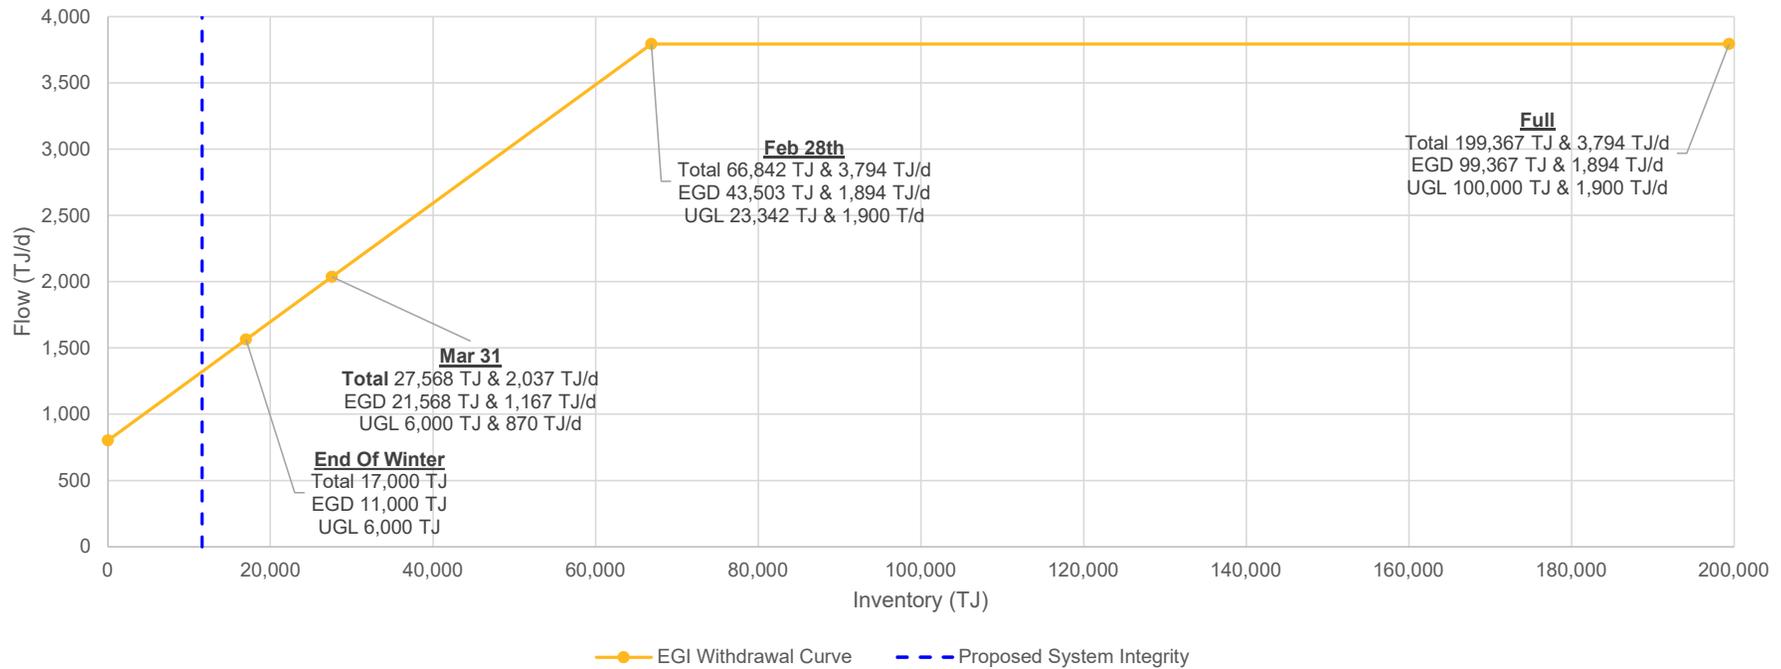

Operational Contingency Details

	Current Union EB-2011-0210 (PJ)			2024 Proposed (PJ)		
	Space (PJ)	Mol. (PJ)	Total (PJ)	Space (PJ)	Mol. (PJ)	Total (PJ)
Weather	1.2	1.4	2.6	2.9	5.0	7.9
UFG	1.0	1.2	2.2			
Line Pack		1.1	1.1		1.3	1.3
Reservoir Factors	0.8	1.4	2.0	1.3	3.5	4.8
OBA	0.5	0.4	0.9	0.7	0.9	1.6
Supply		0.7	0.7			
Total	3.5	6.0	9.5	4.8	10.8	15.6

Proposed Deliverability Curve (Draft)

Combined EGI Rate Zone

Recommendation

- Adopt Union operation contingency model, with the removal of Supply and UFG components, for EGI. Based on the updated model the recommended operational contingency is 15.6 PJ (4.8 PJ Space & 10.8 PJ Molecule).

Q&A

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 4 & EB-2022-0086 Decision and Order, page 15

Preamble:

EGL evidence states: *Each component is modeled separately to determine the total operation contingency requirements.*

Question(s):

For the components in Table 3, please provide the actual utilization of the components of contingency over the last 5 years by component and the cause for that utilization.

Response:

Operational contingency allows Enbridge Gas to support the reliability and resilience of the storage, transmission, and distribution systems. Operational contingency has been fully available and utilized as required for the benefit of all customers. Tables 1 and 2 show the utilization of operational contingency space and molecules by component.

Table 1
Utilization of Operational Contingency Space by Component

Line No.	Component (PJ)	2017	2018	2019	2020	2021
1	Forecast Weather Variance	3.5	0.0	2.6	1.5	0.8
2	System Linepack (1)	-	-	-	-	-
3	Storage Pool Factors	0.4	1.2	1.8	0.4	0.0
4	OBA/LBA Imbalances	3.8	3.6	1.4	0.9	1.1
5	Total	7.7	4.7	5.7	2.7	1.9

Note:

(1) The system linepack component does not contribute to the amount of operational contingency space required.

Table 2
Utilization of Operational Contingency Molecules by Component

Line No.	Component (PJ)	Winter 2016/2017	Winter 2017/2018	Winter 2018/2019	Winter 2019/2020	Winter 2020/2021
		(a)	(b)	(c)	(d)	(e)
1	Forecast Weather Variance	7.4	7.2	6.0	6.4	6.0
2	System Linepack	3.5	2.3	3.0	3.2	4.1

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 4 & EB-2022-0086 Decision and Order, page 15

Preamble:

EGL evidence states: *Daily gas requirements are determined based upon a weather forecast prepared prior to the beginning of the gas day. Weather that is colder than forecasted will require additional gas from storage than planned.*

Question(s):

Please quantify the impact of a one degree difference in forecast to actual.

- a) Please provide the Oct. & Nov. and the Feb, Mar. & Apr. daily percentage full reports for both Dawn and Corunna over the last 10 years.
 - i. Is the contingency only critical at the very full and very empty scenarios?

Response:

One degree colder across the entire franchise would require 120 TJ of storage withdrawals.

- a) Please see Attachment 1.
 - i. Yes. The operation contingency is most critical at the end of the injection and withdrawal seasons (shoulder months).

Union Rate Zones Storage Pools

Line No.	Date	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022
		(a)	(b)	(c)	(d)	(e)	(f)	(g)	(h)	(i)	(j)
1	2/1	69.1%	38.3%	57.2%	75.7%	67.0%	56.4%	59.3%	69.3%	66.5%	61.0%

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 4 & EB-2022-0086 Decision and Order, page 15

Preamble:

We would like to understand the categorization of the storage pool effects.

Question(s):

Are these hysteresis effects taken into account in EGI's preparation of its injection/withdrawal schedule?

- a) If not, why not?
- b) How much deliverability was associated with the system integrity space in union rebasing?

Response:

Yes.

- a) Please see part b).
- b) There was no deliverability set aside for operational contingency space for the Union rate zone in Union's 2013 Cost of Service Application¹.

¹ EB-2011-0210.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 4 & EB-2022-0086 Decision and Order, page 15

Preamble:

We would like to understand the categorization of the storage pool effects.

Question(s):

Please provide the cost of OBA/LBA tiers for the top 3 major interconnecting pipelines.

- a) Please provide actual OBA/LBA costs for each of the last 5 years by month and by pipeline.
- b) Using TCE/TCPL as an example, does EGI have the ability through remote setting of receipt station pressure to adjust the quantities of gas received to receive measured gas closer to nomination.

Response:

- a) OBA's between interconnecting pipeline operators have no associated charges. It is used to operationally balance physical deliveries to scheduled nominated quantities and is limited in size by pre-determined agreed upon quantities. Operations personnel from both interconnecting operators track and manage the OBA balance and arrange paybacks of imbalances as required. OBA's can also be used by outage coordinators to facilitate outages at interconnects.

LBA's are balancing services offered by TransCanada to manage day-to-day variances between nominated supply and measured demand at each TCPL delivery area. Attachments 1 and 2 provide 5 years of historical LBA charges from TransCanada for the EGD and Union rate zones.

- b) Enbridge Gas manages variances between scheduled nominations and what is physically received by using the NAESB and the two TransCanada STS nomination windows. If needed, nominations are adjusted intra-day to better reflect actual

market requirements or changes in the delivery area. In some delivery areas, Enbridge Gas can use remotely operated settings at stations to influence the overall market demand.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 4 & EB-2022-0086 Decision and Order, page 15

Preamble:

We would like to understand the categorization of the storage pool effects.

Question(s):

In the case of UFG, how much contingency space was allocated previously by Union Gas?

- a) Why was this space set aside since UFG is determined retrospectively through accounting at times of stabilization not in operation?

Response:

As provided at Exhibit 4, Tab 2, Schedule 4, page 3, Table 2, the operational contingency space allocated to UFG was 2.2 PJ for the Union rate zones.

- a) The UFG component was required to manage differences in actual and forecasted UFG.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 4 & EB-2022-0086 Decision and Order, page 15

Preamble:

We would like to understand the categorization of the storage pool effects.

Question(s):

Please breakdown the components that are being reduced to go from 23.5 to 15.6PJ. a) For the Winter of 2022/23, under normal March weather conditions for the EGD territory and forecasted daily deliveries, how much gas would be withdrawn from Corunna storage throughout the month?

- a) If EGI contracted for firm Dawn deliveries for half of the forecasted EGD withdrawals, please determine what remaining contingency space would be required.

Response:

Enbridge Gas notes it has answered the second a) as b).

The 23.5 PJ referenced in Exhibit 4, Tab 2, Schedule 4, paragraph 20 should read 23 PJ. Operational contingency for the EGD rate zone was not determined using the various components of operational contingency as outlined in Exhibit 4, Tab 2, Schedule 4. Therefore, Enbridge Gas is not able to provide a breakdown of the reduction from 23 PJ to 15.6 PJ by component.

- a) The planned storage withdrawals for March 2023 is 25.3 PJ for the EGD rate zone.
- b) Under this scenario, the contingency space requirements would not change since the individual components are based on activity across the system and not directly related to the flow from storage.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 4 & EB-2022-0086 Decision and Order, page 15

Preamble:

We would like to understand the categorization of the storage pool effects.

Question(s):

For the 10.8 PJ of space filled by molecules, please provide a monthly injection/withdrawal schedule for that space.

Response:

Enbridge Gas cannot provide an injection/withdrawal schedule for the 10.8 PJ. Enbridge Gas does not plan to use operational contingency, but rather, the space is held solely for the purpose of balancing unplanned events that may occur throughout each year.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 4 & EB-2022-0086 Decision and Order, page 15

Preamble:

We would like to understand the categorization of the storage pool effects.

Question(s):

Since these Dawn and Corunna space requests are made as Operational Contingency for the secure operation of the integrated storage facility for utility load balancing services, please provide the role that the reliable operation of the storage facility plays in the operation of non-utility storage.

- a) Are any of the costs for space or molecules for Operational Contingency charged to the non-utility operation?
 - i. If so, please provide each components allocation to the non-utility operation.
 - ii. If not, does the non-utility have its own Operational Contingency?
 - (1) If it does not, is the non-utility reliant in any way on the reliability created by Operational Contingency.

Response:

As stated in Exhibit 4, Tab 2, Schedule 4, operational contingency supports the "...reliability and resilience of the Enbridge Gas storage, transmission, and distribution systems". In addition, paragraph 4 states that "...Enbridge Gas requires operational contingency space to support the storage and transmission services provided to all customers, both in-franchise and ex-franchise." Non-utility customers benefit from some components of operational integrity and are allocated costs as shown in Table 1.

- a) Yes. Enbridge Gas assigns a portion of operational contingency space costs to the non-utility operation through the non-utility cross charge. The non-utility cross charge for long-term storage operational contingency is \$0.4 million in 2024 as provided at Exhibit 8, Tab 2, Schedule 8, Attachment 17, page 2, row 25. A description of the

long-term operational contingency non-utility cross charge is provided at Exhibit 8, Tab 2, Schedule 5, page 29.

Please see response at Exhibit I.4.2-FRPO-129 for the treatment of the gas molecules.

i. Please see Table 1.

Table 1
Operational Contingency Components

Line No.	Particulars (PJ)	Operational Contingency Space		
		Total (1)	Utility	Non-Utility

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 5

Question(s):

Please provide the specific reference in the Board's decision in the NGEIR proceeding that allocated 1.7 PJ/day of injection capability and 3.8 PJ/day of dehydration capacity.

Response:

As provided at Exhibit 4, Tab 2, Schedule 5, the injection and withdrawal capacity proposed for Enbridge Gas's cost-based storage is equivalent to what existed (in total) for the existing EGD and Union cost-based storage (100 PJ) at the time of the NGEIR proceeding. Storage withdrawals require dehydration; therefore, design day dehydration capacity is proposed to be equal to the withdrawal capacity.

The NGEIR decision noted the withdrawal capacity for EGD as of that time, indicating that it was 1.8 Bcf per day (1.9 PJ/d).¹ The NGEIR decision did not address injection capacity. Injection capability for EGD was reviewed and discussed in EB-2015-0114, Exhibit D1, Tab 2, Schedule 2, where it indicated that the injection capacity of regulated storage was 0.7 PJ/d. Subsequently, in the Dawn to Corunna Leave to Construct Application, Enbridge Gas indicated that the injection capacity for EGD rate zone customers was 0.8 PJ/day.²

For Union, the NGEIR decision did not indicate the allocation of injection and withdrawal capacity to regulated (cost-based) storage because the split of storage assets had not been done. The allocation was considered over a number of proceedings and was approved in Union's 2010 Earnings Sharing and Deferral and Variance Accounts proceeding³. In that case, the OEB approved Union's one-time separation of plant.⁴ The approach taken by Union whereby 37.7% of deliverability was allocated to unregulated

¹ EB-2005-0551, Decision with Reasons, November 7, 2006, p.11.

² EB-2022-0086, Exhibit B, Tab 2, Schedule 1, pp.5-6.

³ EB-2011-0038.

⁴ EB-2011-0038, Decision and Order, January 20, 2012, p.11.

storage operations is described in the Black & Veatch Report filed in that proceeding.⁵ As provided in Table 2 of Exhibit 4, Tab 2, Schedule 5 in this proceeding, the Company is proposing to use the split between utility/non-utility plant that was approved in Union's 2010 Earnings Sharing and Deferral and Variance Account proceeding⁶ as the basis for establishing the utility/non-utility withdrawal and injection capacity for legacy Union cost-based storage. This results in injection capacity of 0.9 PJ/d and withdrawal (dehydration) capacity of 1.9 PJ/d.

Adding the figures for EGD and Union together results in Enbridge Gas's proposal to maintain cost-based storage at a total withdrawal capacity of 3.8 PJ/d and a total injection capacity of 1.7 PJ/d.

⁵ EB-2011-0038, Tab 4, Attachment 1, pp.1-3-1-5.

⁶ EB-2011-0038.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 5

Preamble:

For the Tecumseh injection capability cited as 0.8 PJ/day, EGI provides a reference to the last annual IRM rate-setting proceeding of EGD.

Question(s):

Is EGI asserting that this is when this level of injection capability was first approved?

- a) If not, please provide the specific approval from the Board for this injection capability.

Response:

No, Enbridge Gas is not asserting that the last IR proceeding for EGD¹ was the proceeding that the OEB approved the injection capacity of 0.8 PJ/d.

- a) Please see response at Exhibit 1.4.2-FRPO-142.

¹ EB-2017-0086.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 5

Preamble:

EGI evidence states: *Union sold storage services at the time of the NGEIR Decision that were deemed to be non-utility. Union also had excess deliverability at the time. The costs related to firm deliverability were allocated to regulated and unregulated customers, including the cost related to excess deliverability.*

Question(s):

Please provide the evidentiary reference to Union's excess deliverability to regulated and "unregulated" customers.

- a) What was the total deliverability at the time of NGEIR?
 - i. Please provide an evidentiary reference for that total.
- b) What were the principles behind the allocation methodology?
- c) How was the excess deliverability managed in the time since the NGEIR decision?

Response:

Please see part b).

- a) Enbridge Gas has provided the calculation at Exhibit 4, Tab 2, Schedule 5, page 7, Table 2, as to what the capacity at the time of NGEIR would have been based on the current excess deliverability. The manner in which this calculation was determined is described in response at Exhibit I.4.2-FRPO-142.
- b) The methodology used to allocate deliverability capacity was considered over a number of proceedings and was approved in Union's 2010 Earnings Sharing and

Deferral and Variance Account Application¹. In that case, the OEB approved Union's one-time separation of plant.² The approach taken by Union whereby 37.7% of deliverability was allocated to unregulated storage operations is described in the Black & Veatch Report filed in that proceeding.³ The results of the allocation are provided at Exhibit 4, Tab 2, Schedule 5, page 7, Table 2.

- c) Since the time of NGEIR, Enbridge Gas has met all the storage deliverability needs of utility customers. The regulated business has benefitted from this approach by having access to more capacity than the costs paid for by the regulated business. Any remaining deliverability, after the needs of utility customers were met, was managed, and utilized by the non-utility operation. As provided at Exhibit 4, Tab 2, Schedule 5, paragraph 9, "Over the same time period, post 2007, utility demands for firm storage deliverability increased exceeding 2 PJ in February 2019 for the Union rate zones. The Company did not withhold any firm storage deliverability from the utility customers and instead, reduced the maximum firm withdrawals available to serve the non-utility market." The use of firm storage deliverability by in-franchise customers exceeding 2 PJ is provided at Exhibit 4, Tab 2, Schedule 5, page 5, Table 1.

¹ EB-2011-0038.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 5

Preamble:

EGI evidence states: *The maximum capacity is set based on the one-time separation of existing storage and general plant assets between the utility and non-utility businesses.¹¹ As described above, the maximum utility firm withdrawal capacity for the storage operations for the EGD rate zone is 1.9 PJ/d, and the maximum firm utility injection capacity is 0.8 PJ/d.*

Enbridge Gas has defined the utility maximum firm withdrawal and dehydration capacity as 1.9 PJ/d and firm injection capacity as 0.9 PJ/d for the storage operations for the Union rate zones. Storage withdrawals require dehydration; therefore, design day dehydration capacity is equal to the withdrawal capacity.

¹¹ *The one-time separation defined an allocation for existing storage and general plant assets but did not define the maximum firm withdrawal, dehydration and injection capacity associated with those assets.*

Question(s):

Please confirm that EGI is saying the maximum firm withdrawal capacity for the utility on a peak day is set by the dehydration capability of 1.9 PJ/day.

- a) If not, please explain.
- b) Please file the dehydration schedule for the last 5 years.
- c) Prior to the merging of the company, did EGD have a contract with Union Gas for dehydration services?
 - i. If so, please file the contract.
 - ii. If not, please explain why EGD storage does not need dehydration for late withdrawal season deliverability.

Response:

Not confirmed.

- a) As stated at Exhibit 4, Tab 2, Schedule 5, page 8, the maximum utility withdrawal capacity on design day is 3.8 PJ/d and therefore, the dehydration capacity is also 3.8 PJ/d. On design day it is assumed that all withdrawals from storage require dehydration.
- b) The dehydration plant at Dawn is available starting November 1 of each year and remains available during the withdrawal season. The moisture content of the gas withdrawn from storage increases as the storage pool pressures decrease. Dehydration is utilized as required to maintain moisture content of the gas below 4 lbs/MMscf before it enters the transmission pipelines connected to Dawn.
- c) Yes, prior to the merging of the companies, EGD contracted with Union Gas for dehydration services.
 - i. The executed contract has been provided at Attachment 1.
 - ii. Please see response to part i).

SCHEDULE 1	PRICING PROVISIONS

THIS DEHYDRATION SERVICE CONTRACT (“Contract”) dated August 16, 2010

BETWEEN:

UNION GAS LIMITED, a company existing under the laws of the Province of Ontario,
(hereinafter referred to as “**Union**”)

- and -

ENBRIDGE GAS DISTRIBUTION INC., a company continued under the laws of the Province of Ontario
(hereinafter referred to as “**Shipper**”)

WHEREAS, Union owns and operates a natural gas dehydration system in south-western Ontario, through which Union offers the Dehydration Service, as defined in Article V herein;

AND WHEREAS, Shipper and Union are parties to a Dawn to Parkway/Lisgar/Kirkwall M12 Transportation Contract (contract M12079), dated March 31, 2004 for service beginning April 1, 2004, as further amended by an Amending Agreement between the parties dated May 14, 2007;

AND WHEREAS, Shipper wishes to retain Union to provide the Dehydration Service, and Union has agreed, subject to the terms and conditions of this Contract, to provide the Dehydration Service requested;

NOW THEREFORE, this Contract witnesses that, in consideration of the mutual covenants and agreements herein contained and for other good and valuable consideration, the receipt and sufficiency of which is hereby acknowledged, the parties hereby agree as follows:

ARTICLE I - INTERPRETATION AND DEFINITIONS

1.01 Divisions, Headings and Index: The division of this Contract into Articles, Sections and Subsections, and the insertion of headings and any table of contents or index provided are for convenience of reference only, and shall not affect the construction or interpretation hereof.

1.02 Industry Usage: Words, phrases or expressions which are not defined herein and which, in the usage or custom of the business of the transportation, storage, and distribution or sale of natural gas, have an accepted meaning shall have that meaning.

1.03 Extended Meaning: Unless the context otherwise requires, words importing the singular include the plural and vice versa, and words importing gender include all genders. The words "herein" and "hereunder" and words of similar import refer to the entirety of this Contract, including the Schedules incorporated into this Contract, and not only to the Section in which such use occurs.

1.04 Conflict: In the event of any conflict between the provisions of this Contract and those of Union’s MPSS, the provisions of this Contract shall prevail over Union’s MPSS.

1.05 Measurements: Units set out in SI (metric) measurement are the governing units for the purpose of this Contract. Units set out in Imperial measurement in parentheses beside their SI (metric) equivalent

are for reference only and in the event of a conflict between SI (metric) and Imperial measurement herein, SI (metric) shall prevail.

1.06 Currency: All reference to dollars in this Contract shall mean Canadian dollars, unless stated otherwise.

1.07 Schedules: Refers to the schedules attached hereto which are specifically included as part of this Contract, and include:
 Schedule 1 Pricing Provisions

1.08 Price Schedule: “**Union’s MPSS**” or “**MPSS**” shall mean Schedule “A” (General Terms and Conditions) and Schedule “B” (Nominations) together with the rates for the provision of Storage Services last adopted by Union from time to time as part of Union’s Market Price Service Schedule, and posted to Union’s website with at least thirty (30) days prior notice. Union’s MPSS shall apply hereto as amended from time to time, as if incorporated into this Contract.

1.09 Definitions: Capitalized terms and certain other terms used in this Contract and not specifically defined shall have the meaning set forth in Union’s MPSS unless the context hereof otherwise clearly requires. The following definitions shall be read and interpreted as though included in the aforementioned:

- (a) “**Authorized Overrun**” means quantities of gas scheduled through the Dehydration Point in excess of 2,100,000 GJ/day;
- (b) “**Dehydration Point**” shall mean the “Dawn Tecumseh Interconnect(s)” Points, as such points are described in the Related Contract and includes the points commonly known in Union’s nomination system as Dawn (Tecumseh) and / or Dawn (TSLE).
- (c) “**Related Contract**” means the Interconnect Operating Agreement dated October 31, 2008 between Union Gas Limited and Enbridge Gas Distribution Inc., as may be amended from time to time.

ARTICLE II *Intentionally blank*

ARTICLE III *Intentionally blank*

ARTICLE IV - TERM OF CONTRACT

4.01 This Contract shall be effective as of September 1, 2010 (such date being known as the “**Commencement Date**”) and shall continue in full force and effect until May 31, 2017, (such period being referred to as the “**Initial Term**”). This Contract will continue in full force and effect beyond the Initial Term, automatically renewing for a period of 5 year(s), and every 5 year(s) thereafter, subject to notice in writing by either party of termination at least three (3) years prior to the expiration thereof.

4.02 *Intentionally blank*

4.03 Without limiting the generality of the foregoing, this Contract may be terminated in accordance with Article XII of Schedule “A” of the MPSS.

4.04 For the purpose of completing a final determination of the actual quantities of gas handled in the Dehydration Service to Shipper, the parties shall have the right to amend their statements for a period equal to the time during which the Interconnecting Pipeline retains the right to amend their statements, which period of time shall not exceed three (3) years from the date of termination of this Contract.

ARTICLE V - DEHYDRATION SERVICE

5.01 Services: Shipper agrees to the terms and conditions set out herein for the provision of the Dehydration Service, which has been selected with respect to 2,100,000 GJ/day (the “**Contract Demand**”) on a firm basis. Union may at any time measure the water vapour content of the gas at the Dehydration Point. If for any gas day the weighted-average water vapour content of the gas received by Union at the Dehydration Point, as determined in Union’s sole discretion, exceeds 65 mg/m³, dehydration shall be deemed to have been provided for all quantities of gas nominated and subsequently scheduled by Union through the Dehydration Point on that gas day (the “**Dehydration Service**”). On any gas day that the Dehydration Service is deemed to have been provided as described herein, all quantities of gas nominated and subsequently scheduled through the Dehydration Point in excess of 2,100,000 GJ shall be considered interruptible and treated as Authorized Overrun in this Contract for the purposes of calculating the Dehydration Service charges as outlined in Schedule 1 of this Contract.

5.02 Accounting for Dehydration Service: All quantities of gas handled by Union shall be accounted for on a daily basis, based on quantities scheduled through the Dehydration Point.

5.03 Commingling: Union shall have the right to commingle the quantity of gas referenced herein with gas owned by Union or gas being stored and/or transported by Union for third parties.

ARTICLE VI - FORCE MAJEURE

6.01 An event of force majeure on Union’s system, as defined in Article XI of Schedule “A” of the MPSS, will excuse the failure to perform the Dehydration Service hereunder, and both parties shall be excused from performance of their obligations hereunder, except for payment obligations, to the extent of and for the duration of the force majeure.

6.02 If on any gas day Union fails to provide the Dehydration Service by reason of force majeure on Union’s system, then for that gas day Union shall credit to Shipper’s invoice an amount equal to the applicable Daily Demand Charge, as defined in this Section, divided by the firm Contract Demand, and then multiplied by the difference between the quantity of gas for which the Dehydration Service was provided and the firm Contract Demand. In no event shall Shipper be entitled to a credit for any day that exceeds the Daily Demand Charge. The term “**Daily Demand Charge**” shall mean the Monthly Demand Charge divided by the number of days in the month for which such rate is being calculated.

6.03 An event of force majeure upstream or downstream of Union's system shall not relieve Shipper of any payment obligations.

ARTICLE VII - SERVICE CURTAILMENT

7.01 Capacity Sharing: Where requests for interruptible Services hereunder exceed the capacity available for such Service, Union will authorize nominations from shippers and allocate capacity as per

Union’s procedures and policies and shippers shall be so advised. Any interruptible Services provided herein are subordinate to any and all firm services supplied by Union and subordinate to Union’s own operational or system requirements.

7.02 Maintenance: Union’s facilities from time to time may require maintenance or construction. If such maintenance or construction is required, and in Union’s sole opinion, acting reasonably, such maintenance or construction may impact Union’s ability to meet Shipper’s requirements, Union shall provide at least ten (10) days notice to Shipper, except in the case of an emergency. In the event the maintenance impacts Union’s ability to meet Shipper’s requirements, Union shall not be liable for any damages and shall not be deemed in breach of this Contract.

To the extent that Union’s ability to meet Shipper’s requirements is impaired, the Monthly Demand Charge shall be reduced in accordance with Section 6.02.

Union shall use reasonable efforts to determine a mutually acceptable period during which such maintenance or construction will occur and also to limit the extent and duration of any impairments. Union will endeavour to schedule and complete the maintenance and construction, which would normally be expected to impact on Union’s ability to meet Shipper’s requirements, during the period from April 1 through to November 1.

ARTICLE VIII - CHARGES AND RATES

8.01 Except as otherwise stated herein, the charges and rates to be billed by Union and paid by Shipper for the Dehydration Service will be those specified in Schedule 1. For greater clarity, provision of fuel shall not be required for Union to provide the Dehydration Service.

8.02 Prices exclude, and Shipper shall pay, any applicable Goods and Services Tax or other taxes, royalties or environmental levies (including but not limited to charges under any form of cap and trade, carbon tax, or similar system) imposed currently or subsequent to the commencement of this Contract.

8.03 Set Off: If either party shall, at any time, be in arrears under any of its payment obligations to the other party, then the party not in arrears shall be entitled to reduce the amount payable by it to the other party in arrears under the Contract, or any other contract, by an amount equal to the amount of such arrears or other indebtedness to the other party. In addition to the foregoing remedy, Union may, upon forty-eight (48) hours verbal notice, to be followed by written notice, take possession of any or all of Shipper’s gas under this Contract and any enhancements to this Contract, which shall be deemed to have been assigned to Union, to reduce such arrears or other indebtedness to Union.

ARTICLE IX *Intentionally blank*

ARTICLE X *Intentionally blank*

ARTICLE XI - NOMINATIONS

11.01 No Nomination: The Dehydration Service is not a nominated service.

ARTICLE XII - SHIPPER'S REPRESENTATIONS AND WARRANTIES

12.01 Shipper's Warranty: Shipper warrants that it will, if required, maintain, or have maintained on its behalf, all external approvals including the governmental, regulatory, import/export permits, and other approvals or authorizations that are required from any federal, state, or provincial authorities for the gas quantities to be handled under this Contract. Shipper further warrants that it shall maintain in effect the Related Contract during the term of this Contract.

12.02 Financial Representations: Shipper represents and warrants that the financial assurances including the Initial Financial Assurances and Security (if any) shall remain in place throughout the term hereof, unless Shipper and Union agree otherwise. Shipper shall notify Union in the event of any changes to the financial assurances throughout the term hereof. Should Union have reasonable grounds to believe that Shipper will not be able to perform or continue to perform any of its obligations under this Contract as a result of one of the following events ("**Material Event**"):

- (a) Shipper is in default, which default has not been remedied, of this Contract or is in default of any other material contract with Union or another party; or,
- (b) Shipper's corporate or debt rating falls below investment grade according to at least one nationally recognized rating agency; or,
- (c) Shipper ceases to be rated by a nationally recognized agency; or,
- (d) Shipper has exceeded credit available as determined by Union from time to time,

then Shipper shall within fourteen (14) days of receipt of such written notice by Union, obtain and provide to Union a letter of credit or other security in the form and amount reasonably required by Union (the "**Security**"). In the event that Shipper does not provide to Union such Security within such fourteen (14) day period, Union may deem a default under the Default and Termination provisions of Section XII of Schedule "A" of the MPSS.

In the event that Shipper in good faith, reasonably believes that it should be entitled to reduce the amount of or value of the Security previously provided, it may request such a reduction from Union and to the extent that the Material Event has been mitigated or eliminated, Union shall return all or a portion of the Security to Shipper within fourteen (14) business days after receipt of the request.

ARTICLE XIII - MISCELLANEOUS PROVISIONS

13.01 Assignment: Shipper may not assign this Contract unless:

- (a) the written consent of Union is obtained;
- (b) any financial assurances as required by Union are provided to Union; and
- (c) the approval of the Ontario Energy Board ("**OEB**") is obtained, if required.

If OEB approval is required, all costs of the application shall be paid by Shipper.

13.02 Notices: All communications provided for or permitted hereunder shall be in writing, personally delivered to an officer or other responsible employee of the addressee or sent by registered mail, charges prepaid, or by facsimile or other means of recorded telecommunication, charges prepaid, to the applicable address set forth below or to such other address as either party hereto may from time to time designate to

the other in such manner, provided that no communication shall be sent by mail pending any threatened, or during any actual, postal strike or other disruption of the postal service. Any communication personally delivered shall be deemed to have been validly and effectively received on the date of such delivery. Any communication so sent by facsimile or other means of telecommunication shall be deemed to have been validly and effectively received on the business day following the day on which it is sent. Any communication so sent by mail shall be deemed to have been validly and effectively received on the seventh business day following the day on which it is postmarked.

Communications to the parties hereto shall be directed as follows:

IF TO SHIPPER: Enbridge Gas Distribution Inc.
500 Consumers Road
North York, Ontario
M2J 1P8

Attention: Manager, Gas Supply Operations
Telephone: 780-420-8469
Facsimile: 780-420-8533

IF TO UNION: Union Gas Limited,
50 Keil Drive North,
CHATHAM, Ontario N7M 5M1

Attention: Director, Business Development, Storage and Transmission
Telephone: 519-436-4527
Facsimile: 519-436-4643

13.03 Law of Contract: Union and Shipper agree that this Contract is made in the Province of Ontario and that, subject to Article X of Schedule "A" of the MPSS, the courts of the Province of Ontario shall have exclusive jurisdiction in all matters contained herein. The parties further agree this Contract shall be construed exclusively in accordance with the laws of the Province of Ontario.

13.04 *Intentionally blank*

13.05 *Intentionally blank*

13.06 Entire Contract: This Contract (including the Schedules attached hereto and the MPSS) constitutes the entire agreement between the parties hereto pertaining to the subject matter hereof. This Contract supersedes any prior or contemporaneous agreements, understandings, negotiations or discussions, whether oral or written, of the parties in respect of the subject matter hereof.

13.07 Time of Essence: Time shall be of the essence hereof.

13.08 Counterparts: This Contract may be executed in any number of counterparts, each of which when so executed shall be deemed to be an original but all of which together shall constitute one and the same agreement. This Contract may be executed by facsimile.

13.09 Amendments and Waivers: Subject to Union's MPSS and the ability of Union to amend the MPSS as contemplated by Section 1.08, no amendment or modification of this Contract shall be effective unless the same shall be in writing and signed by each of the Shipper and Union. No waiver of any

provision of this Contract shall be effective unless the same shall be in writing and signed by the party entitled to the benefit of such provision and then such waiver shall be effective only in the specific instance and for the specified purpose for which it was given. No failure on the part of Shipper or Union to exercise, and no course of dealing with respect to, and no delay in exercising any right, power or remedy under this Contract shall operate as a waiver thereof.

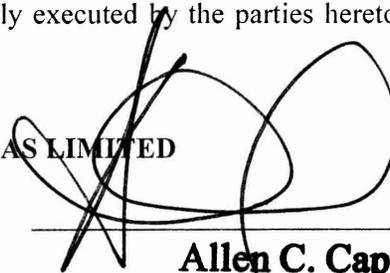

13.10 Severability: If any provision hereof is invalid or unenforceable in any jurisdiction, to the fullest extent permitted by law, (a) the other provisions hereof shall remain in full force and effect in such jurisdiction and shall be construed in order to carry out the intention of the parties as nearly as possible and (b) the invalidity or unenforceability of any provision hereof in any jurisdiction shall not affect the validity or enforceability of any provision in any other jurisdiction.

13.11 General Liability: The liability of the parties hereunder is limited to direct damages only and all other remedies or damages are waived. In no event shall either party be liable for consequential, incidental, punitive, or indirect damages, in tort, contract or otherwise.

THIS CONTRACT SHALL BE BINDING UPON and shall enure to the benefit of the parties hereto and their respective successors and permitted and lawful assigns.

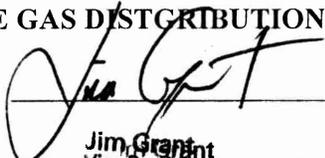

IN WITNESS WHEREOF this Contract has been properly executed by the parties hereto by their duly authorized officers as of the date first above written.

LAW 

PRICING PROVISIONS
DEHYDRATION SERVICE

Shipper agrees to pay Union the following for the Dehydration Service:

a) **Monthly Demand Charge:**

The demand charge payable on the dehydration of gas shall be CDN\$82,432.35 per month. Commencing April 1, 2011 and each April 1st thereafter the monthly demand charge will increase by a factor equal to one-half (1/2) the annual change in the “Canadian Consumer Price Index, All Items Not Seasonally Adjusted”, for the previous calendar year as published in “The Consumer Price Index” as published by Statistics Canada (Catalogue No. 62-001-XPB), or zero, whichever is greater.

Example: If the Canadian Consumer Price Index, All Items Not Seasonally Adjusted for 2010 is 2.0%, then the monthly demand charge effective April 1, 2011 will be \$82,432.35 x (1 + 2.0%/2) or \$83,256.67

b) **Variable Dehydration Charges:**

The Shipper shall pay the lower of:

i) For each GJ of gas (up to the firm Contract Demand) for which the Dehydration Service is deemed to have been provided, a charge equivalent to the “Commodity Charge Price/GJ” in the MPSS shall apply, on a daily basis. For each GJ of gas over the firm Contract Demand authorized as Authorized Overrun for which the Dehydration Service is deemed to have been provided, a charge equivalent to the “Commodity Charge Price/GJ for Authorized Overrun” in the MPSS shall apply, on a daily basis, or;

ii) the maximum commodity charges identified below

Period	Maximum Commodity Charge Price (\$/GJ)	Maximum Commodity Charge price (\$/GJ) for Authorized Overrun
Sept. 1, 2010 - Mar. 31, 2011	\$0.0030000	\$0.0040000
Apr. 1, 2011 to Mar. 31, 2012	\$0.0031500	\$0.0042000
Apr. 1, 2012 to Mar. 31, 2013	\$0.0033075	\$0.0044100
Apr. 1, 2013 to Mar. 31, 2014	\$0.0034729	\$0.0046305
Apr. 1, 2014 to Mar. 31, 2015	\$0.0036465	\$0.0048620
Apr. 1, 2015 to Mar. 31, 2016	\$0.0038288	\$0.0051051
Apr. 1, 2016 to May 31, 2017	\$0.0040203	\$0.0053604

Example: The Variable Dehydration Services for 2,500,000 GJ on a day that the service is deemed to have been provided in September of 2010, is calculated as follows: [2,100,000 GJ multiplied by \$0.003/GJ] plus [(2,500,000 less 2,100,000) GJ multiplied by \$0.004/GJ] = \$ 7,900.00

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 2, Schedule 6

Question(s):

What specific approval(s) is EGI seeking in this proceeding?

a) If seeking, would this approval(s) be included in phase 2 of the proceeding?

Response:

a) Enbridge Gas is not requesting any specific approval in this proceeding as it relates to hydrogen. Exhibit 4, Tab 2, Schedule 6, page 1, paragraph 1 outlines the purpose of Enbridge Gas's hydrogen evidence.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Industrial Gas Users Association (IGUA)

Interrogatory

Preamble:

In respect of EGI's proposal to move to a common gas commodity reference price for inclusion in the gas cost components of 2024 revenue requirement (including, in respect of delivery rates, gas in storage forming part of rate base, UFG, company use gas and compressor fuel), the evidence reviews the advantages of the proposed use of the weighted average of EGI's forecast commodity costs across its gas supply portfolio. These advantages include providing a sales service only price for gas and ensuring a prospective gas commodity cost recovery variance of zero.

Question(s):

Are there any disadvantages, relative to current practices, to moving to the proposed common reference price?

Response:

Enbridge Gas is not aware of any disadvantages, relative to current practices, of moving to the proposed weighted average reference price.

ENBRIDGE GAS INC.

Answer to Interrogatory from
School Energy Coalition (SEC)

Interrogatory

Reference:

4-2-1

Question(s):

With respect to gas supply costs, please explain what Enbridge believes is being approved in this proceeding, as compared to the 2024 QRAM applications and the 2024 annual update process outlined in the Framework for Assessment of Distributor Gas Supply Plans.

Response:

As provided at Exhibit 4, Tab 2, Schedule 1, page 1, Enbridge Gas is requesting “OEB approval of the 2024 Test Year Forecast of gas costs” as set out in the Gas Cost to Operations schedule¹, which will be addressed in Phase 1 of the proceeding, as well as “OEB approval of the cost associated with adding 10 PJ of market-based storage” that was not included in the 2024 Test Year Forecast due to the timing of the ICF engagement, which will be addressed in Phase 2.

Updates to the gas costs included in the 2024 Forecast filed in this proceeding will be approved in the 2024 QRAM applications. The 2024 annual update process pursuant to the OEB’s Framework for Assessment of Distributor Gas Supply Plans will identify changes made in the 2024 Gas Supply Plan versus previous years and forecasts. Impacts of such changes will be captured in appropriate deferral and variance accounts. No approvals are issued in the annual update process.

¹ Exhibit 4, Tab 2, Schedule 1, Attachment 1.

Answer to Interrogatory from
School Energy Coalition (SEC)

Interrogatory

Reference:

4-2-1, p.10-11

Question(s):

With respect to gas supply:

- a) Using the same particulars as Table 1, please provide a table that shows the gas supply/demand position for each year between 2013 and 2024.
- b) Using the same particulars as Table 2, please provide a table that shows design day position for each year between 2013 and 2024.

Response:

- a) Please see Attachment 1.
- b) Please see Attachment 2.

Notes:

- (1) 2013-2023 includes excess utility space.
- (2) Based on ICF analysis provided at Exhibit 4, Tab 2, Schedule 1, Section 2

ENBRIDGE GAS INC.

Answer to Interrogatory from
School Energy Coalition (SEC)

Interrogatory

Reference:

4-2-1, p.19

Question(s):

Does Enbridge Inc. (or any of its affiliates) have any ownership stake (directly or indirectly) in any storage or transportation contract held by Enbridge? If so, please provide details.

Response:

Enbridge Gas has transportation contracts with the following entities that are owned in whole or in part by Enbridge Inc. or its subsidiaries:

- Vector Pipeline – Enbridge Inc. indirectly owns 60% of each of the US and Canadian Vector entities
- NEXUS Gas Transmission, LLC – Enbridge Inc. indirectly owns 50%
- St. Clair Pipelines L.P. – Enbridge Inc. indirectly owns 100%
- 2193914 Canada Limited – Enbridge Inc. indirectly owns 100%

Enbridge Gas's portfolio of market-based storage services includes storage from its own non-utility business and contracts for storage services with Tidal Energy Marketing Inc., a wholly owned Enbridge Inc. subsidiary.

Please see Exhibit 4, Tab 2, Schedule 1, Attachment 3 for details of the transportation contracts with these entities. Please see response at Exhibit I.4.2-EP-60 part e) and f) for summary details on storage contracts purchased from Enbridge Gas's non-utility business and from Tidal Energy Marketing Inc.

ENBRIDGE GAS INC.

Answer to Interrogatory from
School Energy Coalition (SEC)

Interrogatory

Reference:

4-2-1, Attach 1, p.2

Question(s):

Please explain what is meant by 'Affiliate Adjustment' and how is it calculated.

Response:

The affiliate adjustment is the elimination of the costs related to transportation and storage contracts between the EGD and the Union rate zones.

As provided at Exhibit 4, Tab 2, Schedule 1, page 14, prior to rebasing, the cost of the Dawn Parkway System transportation was charged to the EGD rate zone by the Union rate zones to recognize the contracts that existed between EGD and Union prior to amalgamation. Upon rebasing, the Dawn Parkway System transportation costs are no longer treated as gas supply costs of the EGD rate zone and will instead be part of rate base and recovered within delivery rates.

The affiliate adjustment also includes the storage costs between the EGD and Union rate zones as well as an adjustment to reflect the reclassification of Union rate zone optimization revenue as a cost of gas reduction. Please see Attachment 1, note (i), for an example of this in the 2021 Utility Income Schedule.

<u>EGI UTILITY INCOME</u>					
<u>2021 ACTUAL</u>

4-2-1, Attach 6

Question(s):

With respect to the ICF, *Assessment of Storage Capacity Requirements for Enbridge Gas in-franchise Bundled Service Customers* Report:

- a) [p.14] Is holding storage capacity above that of a utility's calculated Aggregate Excess an industry standard? If so, please provide details.
- b) [p.24] Please provide greater detail of the ICF natural gas price forecast between 2025 and 2035, including inputs and assumptions.
- c) [p.26,37] Please provide the forecast market-based storage prices used in the ICF assessment and explain how they were derived.
- d) [p.26] Please explain the driver in Exhibit 3-1 of the significant relative year-over-year changes in costs across all scenarios.

Response:

a-d) This evidence will be addressed in Phase 2 of the proceeding as noted in Enbridge Gas's February 1, 2023 letter.

ENBRIDGE GAS INC.

Answer to Interrogatory from
School Energy Coalition (SEC)

Interrogatory

Reference:

4-2-3

Question(s):

With respect to the proposal for the design demand process:

- a) [p.23] Please explain how the steps set out in paragraph 41 differs, in any way, from the current Union methodology for determining design day demand.
- b) [p.28] Please explain how the steps set out in paragraph 59 differs, in any way, from the current Union methodology for determining general service design hour demand.
- c) [p.28] Please explain how the steps set out in paragraph 60 differs, in any way, from the current Union methodology for determining contract rate design hour demand.

Response:

- a) It is assumed the reference was to paragraph 51 on page 23 instead of paragraph 41. The steps set out in paragraph 51 are the current Union method for determining design day demand. Enbridge Gas is proposing to adopt this method to determine design day demand moving forward.
- b) The steps set out in paragraph 59 are the current Union method for determining design hour demand with the inclusion of energy transition assumptions. Enbridge Gas is proposing to adopt this method to determine design day demand moving forward.
- c) The steps set out in paragraph 60 are the proposed harmonized method for the treatment of contract loads on the distribution system. This proposed process differs from the Union method which used a linear regression analysis based on the previous winter's data.

Question(s):

Please provide the incremental costs across all elements of the proposed revenue requirement, of the harmonized design day demand methodology.

Response:

Costs and savings associated with the proposed harmonized design criteria and design demand process are provided in the pre-filed evidence at Exhibit 4, Tab 2, Schedule 3, paragraphs 66 to 68. Please also see response at Exhibit I.1.10-STAFF-33 for further discussion on the impacts of the proposals to the AMP. Exhibit I.4.2-TCPL-7 part a) sets out details related to uncontracted capacity within the gas supply plan. The costs identified in that response are driven by multiple factors including proposed changes to forecast methodology, regular forecasted customer growth, as well as the proposed change in design day demand methodology. There is a small (less than \$1.0. million) increase to 2024 Rate Base associated with an integration project stemming from the proposals. Enbridge Gas has not calculated the combined revenue requirement impacts associated with the costs and savings identified above.

ENBRIDGE GAS INC.

Answer to Interrogatory from
School Energy Coalition (SEC)

Interrogatory

Reference:

4-2-4, p.3

Question(s):

Please explain how the operational contingency is different than the proposed 10PJ of additional storage Enbridge is proposing above the Aggregate Excess calculation.

Response:

The inventory targets (operational contingency) required to maintain the integrity of the system are different than the storage required to load balance customer demands.

As provided at Exhibit 4, Tab 2, Schedule 4, page 1:

15.6 PJ of operational contingency will be required to support the reliability and resilience of the Enbridge Gas storage, transmission, and distribution systems. Operational contingency requirements will be managed through injection and withdrawal targets rather than procuring additional storage space.

Operational contingency is determined using various operational parameters, including forecast weather variances, system linepack, storage pool factors and OBA/LBA imbalances¹. A description of these components, and how they support system reliability and integrity is provided at Exhibit 4, Tab 2, Schedule 4.

Enbridge Gas's proposal to contract for 10 PJ of market-based storage above what is determined using the aggregate excess calculation is needed to manage risk of relying on winter Dawn purchases for purposes of meeting planned and unplanned load balancing requirements of system customers, which are not already captured in the aggregate excess calculation. ICF evaluated the optimal amount of storage capacity that Enbridge Gas could hold on behalf of bundled, system customers to determine a cost-effective mix of winter Dawn purchases and market-based storage.

¹ Exhibit 4, Tab 2, Schedule 4, Table 3.

Enbridge Gas worked with ICF to evaluate the impact on its portfolio, using different commodity price scenarios developed by ICF, to determine a cost-effective mix of winter Dawn purchases and market-based storage. This analysis shows that in years where the utility experiences volatile commodity prices (typically driven by volatile weather conditions) there are economic benefits to meeting load balancing requirements with storage instead of commodity purchases at Dawn.

Answer to Interrogatory from
TransCanada PipeLines Limited (TCPL)

Interrogatory

Reference:

- 1) Exhibit 3, Tab 4, Schedule 1, Page 4 of 7, Paragraph 10.
- 2) Exhibit 4, Tab 2, Schedule 1, Page 14 of 28, Paragraph 35.
- 3) Exhibit 4, Tab 2, Schedule 1, Attachment 1, Page 2 of 6.

Preamble:

Reference 1) states: "In 2024, with the amalgamation of EGD and Union and the proposed harmonization to one rate zone, Rate M12 long-term transportation contracts are no longer required between EGD and Union which eliminates 3.2 PJ/d of M12 contracting, resulting in a reduction of transportation revenue. These costs will no longer be treated as gas supply costs and will instead be part of rate base and recovered within delivery rates. Please see Exhibit 4, Tab 2, Schedule 1 for further detail."

Reference 2) further discusses the Enbridge transportation capacity on the Dawn Parkway System used to transport supply from Dawn to serve the Enbridge CDA and Enbridge EDA, and how the cost of the Dawn Parkway System transportation was charged to the EGD rate zone by the Union rate zones. It also states that after rebasing the Dawn Parkway System costs are no longer treated as gas supply costs of the EGD rate zone and will instead be part of rate base and recovered within delivery rates. There is an offsetting reduction in regulated revenue relating to storage and transportation revenue.

Reference 3) is a table showing a summary of gas costs for EGI. Line 28 shows Dawn to Parkway Transportation costs which are reduced to zero in the 2024 Test Year from \$116.9 million in the previous year.

Question(s):

- a) Please confirm that the 3.2 PJ/d of M12 contracting between EGD and Union that was previously used to serve the Enbridge CDA and Enbridge EDA required the use of Parkway Station, Dawn Station, and the Dawn Parkway System. If not confirmed, please explain why not.
- b) After rebasing for 2024, will there still be a physical requirement, regardless of contracting structure, for EGI to transport approximately 3.2 PJ/d along the Dawn

Parkway System to serve the Enbridge CDA and Enbridge EDA, and will this physical requirement continue to use Parkway Station, Dawn Station, and the Dawn Parkway System? Please explain.

- c) Please itemize and quantify the costs relating to the transportation capacity used by EGI to transport supply from Dawn to serve the Enbridge CDA and Enbridge EDA that will no longer be gas supply costs as shown in Reference 3) but will instead become part of rate base after rebasing, as discussed in References 1) and 2). Please provide a rate base schedule showing how these specific costs will be included in the rate base.
- d) Please explain specifically how the costs in c) that are discussed in References 1) and 2) will be recovered within delivery rates.
- e) Please provide a schedule quantifying the cost recovery impact discussed in d) in \$/GJ for each delivery rate. Please explain and provide all assumptions relied on in calculating the impacts.
- f) Will the impact of EGI's proposed Parkway Station, Dawn Station, and Dawn Parkway cost allocation methodology changes in this proceeding be factored into the total costs in c) that will be part of rate base and recovered within delivery rates? If so, please quantify and explain how each of the Parkway Station, Dawn Station, and Dawn Parkway System cost allocation methodology impacts will be factored into these costs. If not, please explain why these cost allocation methodology changes will not factor into these costs.

Response:

- a) Confirmed.
- b) Confirmed.
- c-e) There is no impact to rate base from reclassifying the costs to serve the EGD rate zone from gas cost rates to base delivery rates. The evidence references included in the preamble regarding gas costs now being a part of rate base refer to the fact that utility costs will be allocated to EGD in-franchise rate classes as part of the allocation of rate base and operating costs within the Cost Allocation Study.

Prior to 2024, Union's Cost Allocation Study allocated costs to serve EGD based on ex-franchise contracted quantities between Union and EGD. The 2024 Cost Allocation Study allocates costs to serve EGD based on in-franchise requirements which are similar to the contracted quantities that were previously ex-franchise contracts.

From a revenue perspective, the revenue shifts from ex-franchise revenue (or transportation revenue) to in-franchise delivery revenue, with the costs now recovered from all in-franchise customers in base delivery rates. From the perspective of EGD alone, the recovery of costs shifts from a gas cost expense to a delivery revenue requirement.

The 2024 Cost Allocation Study allocates the total in-franchise revenue requirement for the Dawn Parkway System including station costs to all current in-franchise rates classes for the EGD and Union rate zones. The 2024 Cost Allocation Study for current rate classes is provided at Exhibit 7, Tab 2, Schedule 1, Attachments 1 to 12, updated March 8, 2023. Exhibit 7, Tab 2, Schedule 1, Attachment 8, updated March 8, 2023, columns (g) – (q), lines 13,15 and 16, provides the amount of Dawn Parkway System demand costs allocated to the EGD current rate classes. This revenue requirement equals approximately \$114.6 million for 2024. These costs will be recovered in the delivery component of EGD rate zone rates which is consistent with how the costs were recovered as a gas cost expense.

- f) Yes, the proposed changes in cost allocation methodologies for Parkway Station, Dawn Station, and Dawn Parkway, have been included in the 2024 Cost Allocation Study used to allocate the costs to EGD rate zone customers. Please see Exhibit 7, Tab 1, Schedule 4, Attachment 1, updated March 8, 2023, for the impacts of the proposed changes.

ENBRIDGE GAS INC.

Answer to Interrogatory from
TransCanada PipeLines Limited (TCPL)

Interrogatory

Reference:

- 1) Exhibit 4, Tab 2, Schedule 1, Pages 1-2 of 28, Paragraphs 2 and 3.
- 2) Exhibit 4, Tab 2, Schedule 1, Page 11 of 28, Table 2.
- 3) Exhibit 4, Tab 2, Schedule 1, Attachment 3, Page 5 of 6.
- 4) Exhibit 4, Tab 2, Schedule 1, Attachment 4.

Preamble:

Reference 1) states that “For purposes of developing the 2024 Gas Supply Plan, Enbridge Gas has used the most recent information available at the time of filing this Application, including the existing transportation and storage contracts provided in Section 1.4. To capture the costs of uncontracted assets, Enbridge Gas has included an estimate of costs associated with incremental 2024 transportation and storage requirements... Enbridge Gas will not contract for these uncontracted assets until OEB approval is received. Pending OEB approval, Enbridge Gas will continue to monitor any shortfalls and will use the best available information at that time to make contracting decisions.”

Reference 2) is a table showing the design day position from various supply sources. Column (a) shows volumes in the 2023 Bridge Year, column (b) shows volumes in the 2024 Test Year, and column (c) shows the difference between those two years. Line 4 shows supply from NEXUS with an increase of 53 TJ/d in column (c), and Line 9 shows supply from Vector with an increase of 206 TJ/d in column (c).

Reference 3) is a table titled “November 1, 2022 Upstream Transportation Contract Summary” showing EGI contracts on Vector Pipelines L.P., NEXUS Gas Transmission LLC, Great Lakes Gas Transmission, and Great Lakes Pipeline Canada Ltd. The contract volumes for Nexus and Vector Canada appear to add up to 158.3 TJ/d for Nexus and 311.2 TJ/d for Vector Canada.

Reference 4) has two tables, the first showing the 2023 Design Day Position by rate zone and the second showing the 2024 Design Day Position by rate zone. Lines 4 and 9 show the Nexus and Vector design day positions respectively in each table. Nexus shows a 105.5 TJ/d position in 2023, and a 158.3 TJ/d position in 2024. Vector shows a 105.5 TJ/d position in 2023, and a 311.2 TJ/d position in 2024.

Question(s):

- a) Please provide a specific reference in evidence to the “estimate of costs associated with incremental 2024 transportation and storage requirements” that are intended to capture the costs of uncontracted assets, as stated in Reference 1).
- b) Please clarify which uncontracted assets EGI will not contract for until OEB approval is received, as stated in Reference 1). Are the incremental volumes shown in Reference 2) between the 2023 Bridge Year and 2024 Test Year a part of the “uncontracted assets”? If not, please provide a reference in evidence to the volumes that constitute the “uncontracted assets”.
- c) In what proceeding(s) will EGI seek OEB approval for the uncontracted assets and associated cost recovery identified in b), and when will EGI apply for approval?
- d) Please reconcile the 2023 and 2024 design day positions shown in References 2) and 4) with the 2022 contract quantities shown in Reference 3). Specifically, Nexus and Vector contracts for 2022 appear to match the 2024 Design Day Positions but not the 2023 Design Day Positions. Please include a rationale for any contracting changes, supply reclassifications, or any other reasons for the change between the 2023 Bridge Year and 2024 Test Year.
- e) If there were, or are to be, any contracting changes for these NEXUS and Vector volumes between 2023 and 2024, please provide a contract decision analysis, including a landed cost and pricing analysis assessing these contracting decisions against relevant alternatives.

Response:

- a) Enbridge Gas’s estimate of the cost of incremental uncontracted supply and transportation requirements in 2024 is \$44.8 million and is provided at Exhibit 4, Tab 2, Schedule 1, Attachment 1, page 1, line 10.

Enbridge Gas’s estimate of the cost of market-based storage contracts in 2024, some of which are currently uncontracted, is \$13.2 million and is provided at Exhibit 4, Tab 2, Schedule 1, page 2, line 26.

Enbridge Gas’s estimate of the cost of the incremental 10 PJ of storage is \$10 million; however, this will be partially offset by approximately \$6 million of commodity savings as a result of holding this incremental storage. Details of this estimate is provided at Exhibit 4, Tab 2, Schedule 1, pages 25-26.

- b) Enbridge Gas will not contract for incremental transportation assets required to meet the 113 TJ/d increase to the Enbridge CDA design day shortfall as a result of the proposal provided at Exhibit 4, Tab 2, Schedule 3, or the 10 PJ of incremental storage proposed in Exhibit 4, Tab 2, Schedule, pages 22-26 until OEB approval is received. Details on how Enbridge Gas plans to manage the increase to the Enbridge CDA design day demands within the Gas Supply Plan are described in Exhibit 4, Tab 2, Schedule 1, pages 11-12.

The incremental volumes shown at Exhibit 4, Tab 2, Schedule 1, page 11, Table 2 between the 2023 Bridge Year and the 2024 Test Year make up a portion of the total uncontracted transportation assets.

- c) As provided at Exhibit 4, Tab 2, Schedule 1, pages 11-12, any difference between estimated and actual costs will be addressed through the disposition of variance account balances in the applicable QRAM proceeding. Further, Enbridge Gas will continue to follow the OEB's Framework for the Assessment of Distributor Gas Supply Plans and file information on gas supply contracting decisions according to those requirements.
- d) The 2023 column in the design day table provided at Exhibit 4, Tab 2, Schedule 1, Table 2 reflects current rate zones, whereas the 2024 column reflects the proposal to move to one rate zone. There are no forecasted changes to the contracts for Vector or NEXUS between those years. The changes in the table are a result of harmonizing how the Vector and NEXUS capacity is displayed in the design day table.

Currently, capacity for both Vector and NEXUS is assigned to specific rate zones. The EGD rate zone is assigned 206 TJ/d of Vector capacity and the Union North rate zone is assigned 52 TJ/d of NEXUS capacity. Since these contracts deliver into the Union South rate zone and must use other transportation paths (Dawn Parkway and TCPL) to reach the EGD and Union North rate zones, these volumes are embedded in the in-franchise supply line of the table for 2023.

The remaining capacity for these contracts (106 TJ/d of Vector and 106 TJ/d of NEXUS) are assigned to the Union South rate zone. Since these contracts deliver directly into the Union South rate zone and do not use other transportation paths, they are shown in the Vector and NEXUS lines of the table.

In order to harmonize the approach, Enbridge Gas has removed the EGD and Union North portions of these contracts from the in-franchise supply line and added them to the Vector and NEXUS lines for 2024.

As a result, for 2024 the 206 TJ/d of Vector capacity that was previously assigned to the EGD rate zone was removed from the in-franchise supply line and added to the Vector line. Similarly, for 2024 the 52 TJ/d of NEXUS capacity that was previously assigned to the Union North rate zone was removed from the in-franchise supply line and added to the NEXUS line.

A summary of the presentation reclassification between the 2023 design day and 2024 design day provided at Exhibit 4, Tab 2, Schedule 1, Table 2 is included in Table 1.

Table 1
Summary of Nexus and Vector Reclassification

Line No.		2023 Bridge Year (a)	2024 Test Year (b)	Decrease in In-franchise Supply (c)= (b-a)
1	NEXUS	106	158	53
2	Vector	106	311	206

- e) Enbridge Gas has not forecasted changes to its contracted deliveries from Vector or NEXUS pipelines between 2023 and 2024.

Exhibit 4, Tab 2, Schedule 4

Question(s):

Effective 2024, Enbridge Gas plans to adopt the approach of managing operational contingency using cost-based storage inventory targets.....

a) What are the annual operational savings in the change in storage inventory targets?

Response:

a) To estimate the expected savings of managing operational contingency using storage targets rather than procuring incremental market-based storage, Enbridge Gas estimated savings on a planned weather-normal basis.

Enbridge Gas's proposal is expected to save an average of \$2 million per year from 2024 to 2028, relative to the cost of procuring additional market-based storage services to meet operational contingency requirements. These expected savings were calculated using the demand charges associated with incremental market-based storage, less the potential commodity savings that would result from the additional storage being available on a planned basis.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Vulnerable Energy Consumers Coalition (VECC)

Interrogatory

Reference:

Exhibit 4, Tab 2, Schedule 2, page 6, par 19.

Question(s):

- a) In considering a harmonized reference price EGI seems to have considered using either existing reference prices or a single price. What consideration was given to creating gas supply zones based on NAESB transaction hubs? For example, Union EDA and Enbridge EDA share roughly the area of Ottawa-Kingston, whereas Union CDA and Enbridge CDA share Ontario south west and GTA region. Union WDA and NDA cover a large part of Northern Ontario. Such a plan might divide Ontario into three zones North, Southwest and East (or something similar). What benefits or issues might there be in aligning gas supply reference prices with gas supply transaction zones such as those described?

Response:

- a) Enbridge Gas has considered various alternatives to define rate zones for gas supply and associated reference price, and transportation costs. A description of the rate zone alternatives, including the potential benefits and challenges, are provided at Exhibit 8, Tab 2, Schedule 1. The alternatives are based on four service areas (Central, East, North, and South) for defined geographic regions with similar operating characteristics. These service areas also align with the TCPL delivery areas including:

- Enbridge CDA as Central;
- Union EDA and Enbridge EDA as East;
- Central MDA, Union WDA, Union NDA and Union SSMDA as North; and
- Union South as South.

A summary of the rate zone alternatives is provided at Exhibit 8, Tab 2, Schedule 1, Attachment 1. Please also see response at Exhibit I.8.2-STAFF-242 for a description of the advantages and possible disadvantages of the proposed alternatives.

Answer to Interrogatory from
Vulnerable Energy Consumers Coalition (VECC)

Interrogatory

Reference:

Exhibit 4, Tab 2, Schedule 3, page 31

Question(s):

- a) Please confirm (or correct) that under the design day methodology proposed by EGI all interruptible load is assumed to be curtailed. If this is not the case please explain why.

Response:

- a) Enbridge Gas's Gas Supply Plan assumes all interruptible customers are curtailed.

The transmission and distribution system asset design generally assume interruptible customers are curtailed. There are a few systems that may have interruptible customers ON from a pipeline system design perspective. The Sarnia Industrial Line (SIL) is an example.

For the SIL System, interruptible customers are curtailed from a gas supply planning perspective. However, from a pipe design perspective, SIL System is designed with interruptible customers ON to ensure there is enough pipeline capacity to meet these demands. The customers served by the SIL System have minimal heat sensitivity because they consist of very large petrochemical manufacturers and power generators. These customers operate in a continuous fashion that is almost entirely base load.

Ninety percent of the demand on this system is for these base load customers. The remaining ten percent are general service customers and don't generate enough heat sensitivity to create enough interruptible space to mitigate the need for pipeline assets.

Question(s):

Table 4
Customer Care O&M

Line No.	Particulars (\$ millions)	Utility	<u>2018</u>	<u>2019</u>	<u>2020</u>	<u>2021</u>	<u>2022</u>	<u>2023</u>	<u>2024</u>
			Actual (1)	Actual	Actual	Actual	Estimate	Bridge Year	Test Year
			(a)	(b)	(c)	(d)	(e)	(f)	(g)
1	Salaries & Wages	EGI	26.6	24.5	22.1	23.7	24.1	25.6	27.1
2	Contract Services	EGI	106.0	93.3	81.6	82.8	75.9	79.4	80.9
3	Bad Debt	EGI	10.6	9.0	10.7	13.2	14.1	17.5	21.5
4	Other O&M	EGI	9.8	3.9	3.2	(3.1)	4.2	1.4	5.6
5	Total	EGI	153.0	130.7	117.6	116.6	118.3	123.9	135.1

“Finally, the \$4.2 million increase in other O&M costs is driven by \$3 million from the previous year’s reduction from unapplied customer payments and \$1.2 million for the Company’s proposal to treat DCB as a utility activity” (pg. 22)

- a) We are unclear what is meant by this statement. Is EGI suggesting that \$4.2 million are not incremental and reoccurring costs in 2024? Please clarify.
- b) Please show the FTES for Customer Care for each year in the table.
- c) Please explain how the bad debt estimate for 2024 was derived.
- d) Please update Table 4 for 2022 actual results.

Response:

The reference noted above should be Exhibit 4, Tab 4, Schedule 2.

- a) The costs set out in the 2024 Test Year are representative of reoccurring costs from 2023. The unapplied customer payments and distributor consolidated billing (DCB) costs resulted in the 2023 Bridge Year Forecast being \$4.2 million lower than the costs in the 2024 Test Year.

In 2023, there was \$3 million worth of accumulated unapplied customer payments that were applied to overall O&M costs as a one-time credit. If this credit from unapplied customer payments was not applied, overall O&M costs would have been higher by \$3 million.

A similar scenario applied to \$1.2 million related to DCB costs. The current DCB service in the EGD rate zone is a non-utility activity and the DCB service in the Union rate zones is a utility activity. Prior to 2024, EGD DCB costs are excluded from O&M costs since it is a non-utility activity. The Company is proposing to treat the harmonized service as a utility service across all rate zones beginning on January 1, 2024¹ increasing O&M costs by \$1.2 million.

- b) Please see Table 1 for Customer Care full-time equivalents (FTEs) from 2018 to 2024.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 4, Tab 3, Schedule 1 (UFG)

Question(s):

- a) Please reproduce the tables in Attachment 1 adding rows for (i) estimated UFG from leaks (m³), and (ii) the carbon emissions arising therefrom (tCO₂e).
- b) Why is the UFG so much higher in 2021 (359,555,000) versus 2020 (196,655,000).
- c) What is the total UFG as a percent of throughput for Enbridge as a whole on-average for the most recent 5-years?
- d) What is the total UFG estimated to arise from leaks as a percent of throughput for Enbridge as a whole on-average for the most recent 5-years?
- e) Please confirm that the UFG numbers do not include leaks from customer equipment.
- f) Per page 15, a considerable portion of the UFG leaks from storage facilities (e.g. 61,082,000 m³ in 2021). If those storage facilities were holding the same quantity of hydrogen instead of methane, approximately how much would leak annually? If those storage facilities were holding the same quantity of a 20/80 hydrogen/methane blend instead of methane, approximately how much would leak annually?
- g) How many carbon emissions arise from 1 m³ of leaked (i) RNG and (ii) hydrogen.
- h) How much would it cost for Enbridge to reduce leaks in its system by 50%?
- i) Do the UFG figures include leaks from non-rate-regulated storage facilities in Ontario? Please explain.

Response:

- a) Please see Attachment 1, which includes the estimated UFG volume from leaks and the associated GHG emissions.
- b) The increase in UFG volumes from 2020 to 2021 was primarily driven by increased UFG volumes for the Union rate zones. Please see Attachment 2 for evidence filed in EB-2022-0110 for the Union rate zone UFG Volume Deferral Account for 2021, where contributors of the year-over-year increase of UFG were described, including estimation true-ups associated with the December 2020 unbilled sales volumes as well as prior period adjustments.
- c) Please see Attachment 3 for the UFG as a percent of throughput for the years from 2018 to 2022. The 5-year average for the UFG % is 0.651%.
- d) Please see Attachment 3 for the UFG volume from leaks as a percent of throughput for the years from 2018 to 2022. The 5-year average for the UFG leak % is 0.052%.
- e) The estimated UFG from leaks includes leaks from the transmission, storage and distribution system up to and including the customer meter.
- f) Enbridge Gas has not yet studied the technical feasibility of storing hydrogen in its underground storage pools and therefore, is not able to estimate leakage in relation to hydrogen storage.
- g) There is approximately 0.016 tCO₂e of emissions emitted due to the leakage of 1 m³ of RNG, based on federal and provincial greenhouse gas reporting regulations. Additionally, as per these regulations, hydrogen is not identified as a reportable greenhouse gas and as such does not result in the release of greenhouse gas emissions.
- h) Leaks can occur in the transmission, storage and distribution systems up to and including the customer meter. Providing an estimated cost to reduce leaks in the system by 50% is not feasible as each individual asset has its own unique set of features and conditions. The nature and cost of repairs can vary significantly depending on the field conditions (i.e. concrete vs sod, greenfield vs. improved).
- i) The UFG figures included in Exhibit 4, Tab 3, Schedule 1, Attachment 1 and 2 do not include UFG for the non-regulated business. Enbridge Gas does not operationally segregate its storage facilities as regulated or non-regulated. For the purposes of calculating UFG, there is an allocation between utility and non-utility storage which is provided at Exhibit 1, Tab 13, Schedule 2, Attachment 1, pages 14 to 15. This evidence will be addressed in Phase 2 of the proceeding as noted in Enbridge Gas's February 1, 2023 letter.

UFG Volumes, Estimated UFG Volumes from Leaks and UFG Leak Emissions

Line No.	Particulars	Utility	<u>2013</u>	<u>2014</u>	<u>2015</u>	<u>2016</u>	<u>2017</u>	<u>2018</u>

Note:

- (1) EGD rate zone.
- (2) Union rate zone.
- (3) Leak volumes include both utility and non-utility volumes.
- (4) Leak volumes in line 5 and line 6, and emissions in line 9 and line 10 for 2022 are an estimate.
- (5) 2022 UFG Volumes are subject to ongoing analysis. Final balances will be included in Enbridge Gas's 2022 Utility Earnings and Disposition of Deferral & Variance Account Balances Application to be filed in 2023.

UNACCOUNTED FOR GAS VOLUME DEFERRAL ACCOUNT
UNION RATE ZONES

1. The purpose of the Unaccounted for Gas (UFG) Volume Deferral Account is to capture the difference between the unit cost of UFG recovered in the rates approved by the OEB and actual UFG costs incurred. The amount of the UFG volume deferral account to be cleared to customers is subject to a symmetrical dead-band of \$5.0 million, with amounts within such dead-band being to Enbridge Gas's account.

2. Union rate zones' 2021 Board Approved rates included \$10.1 million in UFG costs. Based on 2021 actual volumes, Enbridge Gas recovered \$10.4 million in UFG costs for 2021. In comparison, Enbridge Gas's actual 2021 UFG costs were \$35.9 million. The difference of \$25.5 million is above the \$5.0 million threshold established by the OEB for the UFG Volume Variance Account. As a result, there is a debit balance of \$20.5 million in the UFG Volume Deferral Account, plus interest of \$0.2 million for a total debit balance of \$20.7 million. See Table 1 below.

Table 1
2021 UTILITY UFG VARIANCES FROM BOARD-APPROVED

Line No.	Particulars	Variance (\$Millions)
1	UFG Cost Included in Rates	\$ 10.1
2	Net Recovery Variance	<u>\$ 0.3</u>
3	Total UFG Collected in 2021 Rates (line 1 + line 2)	\$ 10.4
4	Total Utility UFG Actual Cost	<u>\$ 35.9</u>
5	Total Utility UFG Variance (line 3 - line 4)	-\$ 25.5
6	\$5M UFG Symmetrical Dead-band	<u>\$ 5.0</u>
7	UFG Volume Deferral (receivable)	<u><u>-\$ 20.5</u></u>

(1) Board Approved throughput was 32,010 10⁶m³ versus actual throughput of 37,612 10⁶m³

(2) Board Approved UFG % is 0.219% versus actual UFG % of 0.672% for 2021.

3. The methodology for determining the actual UFG expense of \$35.9 million in 2021 is consistent with the methodology historically used to calculate actual UFG for the audited Financial Statements, utility rate setting and earnings calculation.
4. Table 2 and Table 3 provide historical UFG volumes and percentage of throughput for the Union rate zone from 2001 to 2021.

Table 2: Historical UFG Percentage of Throughput for the Union Rate Zone

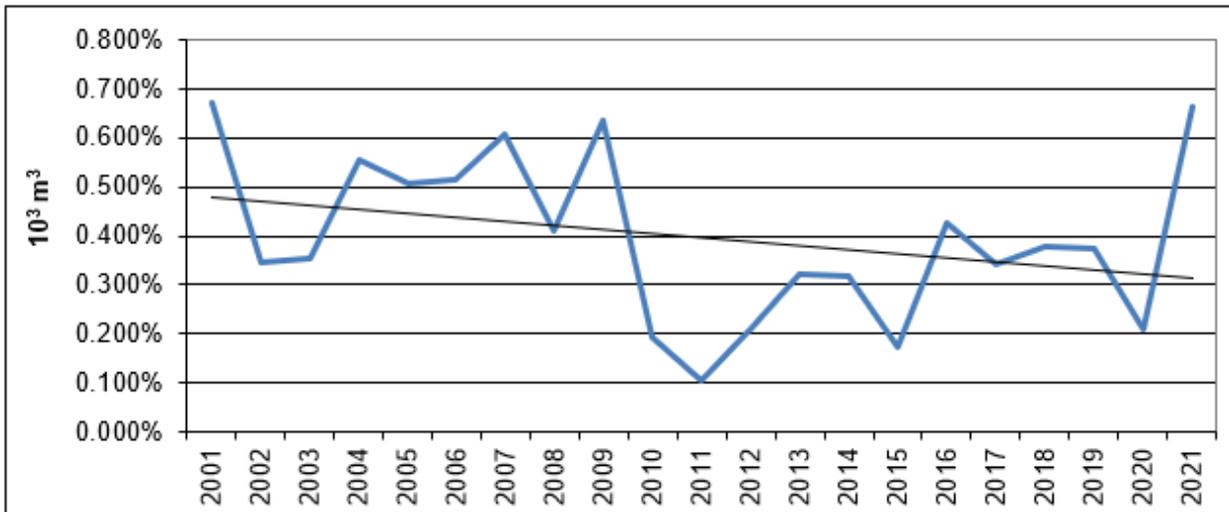

Table 3

<i>Col.1</i>	<i>Col.2</i>	<i>Col.3</i>
Calendar Year	UFG Volumes (10³ m³)	UFG %
2001	184,102	0.673%
2002	109,542	0.344%
2003	108,819	0.356%
2004	176,650	0.554%
2005	169,540	0.507%
2006	154,015	0.516%
2007	203,713	0.609%
2008	143,880	0.411%
2009	201,845	0.637%
2010	67,283	0.192%
2011	35,668	0.105%
2012	68,690	0.210%
2013	113,997	0.320%
2014	97,109	0.318%
2015	54,408	0.174%
2016	131,588	0.427%
2017	108,901	0.342%
2018	136,447	0.379%
2019	137,652	0.376%
2020	74,120	0.208%
2021	252,582	0.672%

- The 0.219% UFG percentage used in approved rates was determined in EB-2011-0210 using the weighted average of the previous three years actual UFG. At the time 2013 rates were set, the most recent three years actual UFG available was 2009 to 2011. The Board approved methodology uses a 3:2:1 weighting with the most recent year weighted most heavily. The result was a ratio for UFG in rates influenced heavily by 2011’s favourable ratio. Concern over the ability to manage UFG relative to the new ratio was a factor in the establishment of a deferral account to capture variances, as was approved in EB-2013-0202.

6. Since the 2013 Board Approved percentage was determined, the average UFG percentage has been 0.356%, for the years of 2013 through 2021. Within that period of 2013 through 2021, the UFG % in 2015 was notably lower than the average, with a corresponding increase in 2016. Similarly, the UFG % in 2020 was lower than the average, with an increase in the UFG % observed in 2021.
7. As was noted in EB-2017-0091 Exhibit B.Staff.9, the increase in UFG volumes experienced in 2016 was primarily driven by a decrease in delivery volumes recorded in January 2016 relating to true-up of estimated consumption recorded in December 2015.
8. A similar decrease and offsetting increase in UFG volumes has been observed between the 2020 and 2021 calendar years. The average UFG % for 2020 and 2021 is 0.440%, which is approximately $163.5 \text{ } 10^3\text{m}^3/\text{year}$ average for the two years. The Company has identified that the true-up of estimated consumption based on the calendarization of UFG volumes has contributed to volatility between 2020 and 2021, but has not resulted in a material increase to the historical average of UFG over the course of two years. Typical estimation true-ups are outlined below.
9. At the end of each reporting period, Enbridge Gas records an estimate of gas delivered but not yet billed. The true-up between the December 2020 estimate and the actual billed volumes resulted in a decrease to the delivery volumes recorded in January 2021. This true-up reflects that, when billings related to December 2020 were completed over the following month, it was determined there was an over-estimate of gas deliveries for December 2020.
10. A second common estimation true-up is known as a prior period adjustment (PPA). PPAs are processed when there is a variance between a billed estimate and actual volumes. The inclusion of PPAs within the annual reported consumption volumes is

consistent with the methodology historically used to calculate actual UFG for the audited Financial Statements, utility rate setting and earnings sharing calculation.

11. The UFG volumes in 2020 were abnormally low compared to the historical average.

The estimation true-up recorded in 2021 caused UFG volumes in 2021 to be elevated. As mentioned, the average of 2020 and 2021 is in line with the historical average of UFG volumes from 2013 to 2021.

12. Enbridge evaluated other factors that could have impacted UFG including, investigating meter reads between custody and check meters for inconsistencies, reviewing accounting processes associated with recording company use and line-pack changes, assessing impacts arising from the transition of Union rate zone customers to the SAP customer information system, and reviewing storage inventory adjustments. These items were deemed to have minimal impact on the elevated level of UFG in 2021. Enbridge is continuing to monitor and address potential contributors to UFG.

13. Volatility in UFG is not uncommon and is experienced across the gas utility industry. The 2019 UFG report prepared by ScottMadden filed in the 2020 Rates Application (EB-2019-0194) noted that:

“....legacy Union and legacy EGD have year-to-year fluctuations in UFG levels that are generally consistent with those of other gas utilities. The fluctuations are a result of many factors, including weather, estimation variation, measurement variation, and billing and accounting adjustments.all gas distribution pipeline systems have UFG as an element of operating a natural gas distribution system and that because of the numerous factors that impact UFG, the UFG percentage will fluctuate over time.¹”

¹ EB-2019-0194, UFG Progress Report, page 4.

14. Enbridge Gas filed the 2019 UFG Study as part of the 2020 rate application (EB-2019-0194). The report found that the primary sources of UFG include physical losses (eg. leaks, third-party damage and venting), metering variations, non-registering meters, theft, line pack and billing and accounting adjustments (such as the estimate of gas delivered but not yet billed required at the end of each reporting period to report results). Although the root causes of UFG are generally known as described above, it continues to be difficult to quantify the individual factors due to their nature. Certain sources of UFG, such as leaks and emissions, contribute to baseline UFG while other sources such as billing, and accounting adjustments contribute to UFG volatility.

15. As committed by the Company in 2020 Rates application (EB 2019-0194), Enbridge Gas will file an update in the 2024 rebasing application about the implementation of the UFG report recommendations and other activities to address UFG, and the impacts of such activities.

Percentage of Throughput for UFG Volumes and Estimated UFG Volumes from Leaks

7	UFG % of Throughput	EGI	0.588%	0.567%	0.413%	0.725%	0.961%
8	UFG Leak % of Throughput	EGI	0.046%	0.052%	0.055%	0.055%	0.049%

Notes:

- (1) EGD rate zone.
- (2) Union rate zone.
- (3) Leak volumes include both utility and non-utility volumes.
- (4) Leak volumes in line 4 and line 5 for 2022 are an estimate.
- (5) 2022 UFG Volumes are subject to ongoing analysis. Final balances will be included in Enbridge Gas's 2022 Utility Earnings and Disposition of Deferral & Variance Account Balances Application to be filed in 2023.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Environmental Defence (ED)

Interrogatory

Reference:

Exhibit 4, Tab 3, Schedule 1 (UFG)

Question(s):

- a) Please describe any research that has empirically studied economy-wide methane leaks in Ontario (e.g. via aerial surveys). Please file a copy or provide a link.
- b) Please provide a comparison between Enbridge's estimates of the gas that leaks from its facilities versus the methane leaks in Ontario estimated through empirical studies such as aerial surveys. If there is a significant deviation, please discuss the possible reasons for this.

Response:

- a) Enbridge Gas has not been involved in or been made aware of any studies related to this matter.
- b) As Enbridge Gas is not aware of any empirical studies, we have not formed any comparison.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Energy Probe Research Foundation (EP)

Interrogatory

Reference:

Exhibit 4, Tab 3, Schedule 1, Page 5, Paragraph 12, and Footnote 9; page 7, Table 2
Unaccounted for Gas (in 103m3) Forecast Accuracy Comparison

Preamble:

“Prior to completing the accuracy comparison of the selected methodologies, the regression used for the EGD rate zone was estimated using Enbridge Gas actual UFG data from 2008 to 2021, using historical UAF volumes from the EGD rate zone and historical UFG volumes for the Union rate zone (footnote 9). Based on the results of the regression analysis, it was determined that the regression methodology was not an appropriate method to use to forecast UFG, when using combined historical UAF and UFG volumes.”

Footnote 9: “The current EGD regression equation includes a dummy variable to account for the anomaly in 2004, where UAF volumes were negative. This dummy variable was excluded from the model for the purposes of this analysis, as the combined historical volumes did not include a negative value in any year.”

Question(s):

- a) If the combined historical volumes in 2004 did not include a negative value, does that indicate that the gain in volume for EGD in 2004 was more than offset by the loss in volume by Union? Please explain your answer.
- b) Please file the results of the regression analysis that was used to determine that the regression methodology was not an appropriate method by adding columns to Table 2 for the regression methodology.
- c) Was the regression method tried by excluding the dummy variable? Please explain your answer.

Response:

- a) The gain in volume for EGD in 2004 was more than offset by the loss in volume by Union. In 2004, there was a gain of 22,406 10^3m^3 for EGD UAF which was offset by a loss of (176,650) 10^3m^3 for Union.
- b) The data provided at Exhibit 4, Tab 3, Schedule 1, Table 2 is incorrect. Please see response at Exhibit I.4.2-STAFF-107, Attachment 1, Table 1 for the corrected data and for the updated comparison analysis that includes the regression methodology and Exhibit I.4.2-STAFF-107, Attachment 1, Table 4 for the updated regression results.
- c) Yes, the regression method was tried by excluding the dummy variable. The data doesn't require including dummy variable because the combined historical volumes did not include a negative value. Also, when running the regression on the combined Enbridge Gas UFG data which shorter than the EGD UAF only data, the model with dummy variables cannot be estimated due to insufficient degrees of freedom to estimate the model. Therefore, dummy variables are removed from the updated model. Please see response at Exhibit I.4.2-STAFF-107, Attachment 1, Table 4 for the regression results.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Energy Probe Research Foundation (EP)

Interrogatory

Reference:

Exhibit 4, Tab 3, Schedule 1, Page 17, Paragraphs 40 and 41, table 7

Question(s):

- a) The Table 7 indicates that there was a gain in volume of 3,994 10 3 m3 in the 2012 to the 2021 period. What would have caused the gain? Please discuss.
- b) Does not the data in the table indicate that variances were caused by measurement errors? What is the accuracy of the meters used and does the accuracy vary with flow rate and pressure?

Response:

- a) Exhibit 4, Tab 3, Schedule 1, page 16, paragraph 36 identifies that "These adjustments are required to correct for measurement errors and account for the migration of gas within the reservoir". Measurement errors can be positive or negative indicating a gain or loss in inventory. Therefore, a gain can be attributed to measurement errors or gas migration from tighter portions of the reservoir.
- b) As described in part a), variances may be caused by measurement errors or the migration of gas within the reservoir. Enbridge Gas has installed custody transfer quality meters at each storage pool. Measurement is designed to +/- 1% uncertainty within the specified flow and pressure ranges.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Energy Probe Research Foundation (EP)

Interrogatory

Reference:

Exhibit 4, Tab 3, Schedule 1, Attachment 1, Page 2

Question(s):

- a) Please add a line to the UFG Volumes table that shows the average heating value of gas at receipt points in kJ/m³.
- b) Please update the UFG Volumes table by showing the 2022 Actual volumes.

Response:

- a) Average heat value is not calculated by receipt points for EGD rate zone for actual or forecast years. The annual average heat value by rate zone for 2019 to 2024 is provided in Table 1.

Table 1 - Annual Average Heat Value (KJ/m³)

Line No.	Utility	2019 Actual	2020 Actual	2021 Actual	2022 Estimate	2023 Bridge Year	2024 Test Year
		(a)	(b)	(c)	(d)	(e)	(f)
1	EGD	38,997	39,052	38,992	38,983	38,992	
2	Union	39,117	39,172	39,075	39,187	39,120	
3	EGI						39,076

- b) Please see response at Exhibit I.4.3-LPMA-30, Table 1.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Energy Probe Research Foundation (EP)

Interrogatory

Reference:

Exhibit 4, Tab 3, Schedule 1, Attachment 4, page 9, *3.4 Other Sources of UFG*

Question(s):

- a) Please confirm that Enbridge Gas is billed in units of energy and not in units of volume by TC Energy and Vector?
- b) Would variations in energy per unit volume have any impact on UFG? Please discuss.

Response:

- a) Confirmed.
- b) Yes, variations in energy per unit volume would have an impact on UFG. On a monthly basis, the UFG volume is calculated based on the approved heat value. In the following month, when actual heat values are available, the heat value differences, or variations in energy per unit volume, are recorded in the UFG deferral accounts by applying the heat value difference to the UFG volume. Please see response at Exhibit I.3.6-FRPO-80 part d) for additional detail on energy content related adjustments.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 3, Schedule 1

Preamble:

We would like to understand better the sources of UFG and the steps that EGI has undertaken to reduce the cost to ratepayers.

Question(s):

Many of the figures and tables in this schedule depict data dating back to 2008 including Figure 2 of Attachment 3, page 4. For each utility/Rate Zone, please provide the unaccounted for gas disaggregated into the categories of storage, transmission and distribution along with the respective category activity parameters utilized to present percentages.

- a) Please explain how EGI determines the amount of UFG on the transmission system as depicted in Table 6 on page 15 of Schedule 1.

Response:

Please see Table 1 for the UFG volumes by activity for the EGD and Union rate zones for the years from 2018 to 2022. The information provided in Table 1 has been prepared consistent with the methodology used to prepare the data for 2021 provided at Exhibit 4, Schedule 3, Tab 1, Table 6.

Please see Attachment 1 for the activity parameters used to present the percentages for Table 1.

From 2008 to 2017, Enbridge Gas did not have the allocation of activity for UFG prepared for purposes of the UFG deferral account balance. As such, a comparable analysis to the data presented in Table 1 has not been prepared for the period of 2008 to 2017.

Table 1
UFG Volumes by Rate Zone and Activity

Line No.	Particulars (10 ³ m ³)	Delivery (a)	Transmission (b)	Storage (c)	Total Volumes (d) = (a+b+c)
	<u>2018</u>				
1	EGD	120,338	-	42,113	162,451
2	Union	29,844	78,986	13,154	121,984
3	Total	150,182	78,986	55,267	284,435
	<u>2019</u>

12	Total	149,848	148,625	61,082	359,555
	<u>2022 (1)</u>				
13	EGD	213,746	-	100,261	314,007
14	Union	50,872	149,033	19,000	218,904
15	Total	264,618	149,033	119,260	532,911

Note:

- (1) 2022 UFG Volumes are subject to ongoing analysis. Final balances will be included in Enbridge Gas's 2022 Utility Earnings and Disposition of Deferral & Variance Account Balances Application to be filed in 2023.

- a) As provided at Exhibit 4, Tab 3, Schedule 1, page 14, for purposes of providing UFG volumes by function, Enbridge Gas has reported Union South rate zone in-franchise delivery volumes as distribution UFG. As such, transmission UFG volumes relate to in-franchise transportation to storage and ex-franchise transportation activity. Transmission UFG volumes are allocated to the transmission function in proportion to the total activity in distribution, transmission, and storage operations.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 3, Schedule 1

Preamble:

We would like to understand better the sources of UFG and the steps that EGI has undertaken to reduce the cost to ratepayers.

Question(s):

Please provide the utility and non-utility space separately for Dawn and Tecumseh for each year starting in 2007.

- a) Please provide the cost in each year to increase the non-utility space.
- b) In the respective years, please indicate if any brand new pools were developed versus other techniques, such as delta-pressuring the existing pools, to increase the non-utility space.

Response:

Please see Tables 1-3 for utility and non-utility space for EGD and Union rate zones for 2007 to 2022.

Table 1
Union Rate Zones Storage Capacity History (2007-2022)

Line No.	Year	Utility (PJ) (a)	Non-Utility (PJ) (b)	Reason for Change (c)
1	2007	100	60	
2	2008	100	68	New Pool, Storage Enhancement
3	2009	100	69	Storage Enhancement
4	2010	100	69	New Pool
5	2011	100	69	
6	2012	100	69	
7	2013	100	69	Storage Enhancement
8	2014	100	71	Storage Enhancement
9	2015	100	75	Storage Enhancement
10	2016	100	78	Storage Enhancement
11	2017	100	81	Storage Enhancement
12	2018	100	82	
13	2019	100	82	
14	2020	100	85	Reservoir Adjustment
15	2021	100	86	Reservoir Adjustment
16	2022	100	87	Storage Enhancement

Table 2
EGD Rate Zone Storage Capacity History (2007-2017)

Line No.	Year	Utility (Bcf)	Non-Utility (Bcf)	Reason for Change
		(a)	(b)	(c)
1	2007	91.3	0	
2	2008	91.3	3	Storage Enhancement
3	2009	91.3	3	
4	2010	91.3	3	
5	2011	91.3	7	Storage Enhancement
6	2012	91.3	12	Storage Enhancement
7	2013	91.3	14	Storage Enhancement
8	2014	91.3	15	Reservoir Adjustment
9	2015	91.3	17	Reservoir Adjustment
10	2016	91.3	17	
11	2017	91.3	17	Reservoir Adjustment

Note: Prior to MAADs Enbridge rate zone storage capacity was done in Bcf.

Table 3
EGD Rate Zone Storage Capacity History (2018-2022)

Line No.	Year	Utility (PJ)	Non-Utility (PJ)	Reason for Change
		(a)	(b)	(c)
1	2018	99.4	19	
2	2019	99.4	20	
3	2020	99.4	23	Storage Enhancement, Reservoir Adjustment
4	2021	99.4	27	Storage Enhancement
5	2022	99.4	29	Storage Enhancement

- a) Enbridge Gas will not provide cost information for non-utility projects as this information is not relevant to UFG, and it is confidential and market sensitive as part of the competitive landscape for natural gas storage in North America.
- b) Please see Tables 1 to 3.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 3, Schedule 1

Preamble:

We would like to understand better the sources of UFG and the steps that EGI has undertaken to reduce the cost to ratepayers.

Question(s):

For the data in Table 7 regarding annual adjustments for storage pool inventories, please provide:

- a) A more fulsome description of the process to determine these adjustments.
- b) For the years since 2002, please provide the actual annual adjustments by utility/rate zone storage space and:
 - i. Since 2007, the adjustments broken down between the utility and non-utility storage space.

Response:

- a) Inventory in all Enbridge Gas natural gas storage pools are monitored per the requirements of CSA Z341.1 (Storage of Hydrocarbons in Underground Formations).

Each storage pool has a dedicated official observation well that is equipped with pressure transducer. In addition, each storage pool has a dedicated custody transfer quality measurement. Pressure and flow measurement is operated and maintained in accordance with company standards. Pressure and flow data is collected and is available in real time and is stored as per company standards.

Gas pressure and measurement data is reviewed and analyzed weekly to evaluate general reservoir trends and to identify any deviation from the known pressure-

inventory relationships. Measurement equipment may be investigated if pressure-inventory relationships deviate from expected behaviors.

Each storage pool receives a stabilization period in the spring following withdrawal operations and in the fall following injection operations. The purpose of the stabilization periods is to allow pressure to equalize across the reservoir to perform more accurate inventory calculations. Stabilization data is utilized to determine variances between measured and calculated inventories. Variances are monitored over multiple storage cycles to determine when adjustments to the measured inventory are required.

The Manager of Underground Storage and Reservoir Engineering is responsible for recommending storage pool adjustments. Adjustments are reviewed and approved by the Vice President, Energy Services. In addition, Enbridge Gas's external auditor reviews all adjustment and inventory analysis on an annual basis.

b) Please see Table 1.

Table 1
Storage Pool Inventory Adjustments

Line No.	Year	Union Rate Zones		EGD Rate Zone	
		Adjustments (10 ³ m ³)	Percentage (%)	Adjustments (10 ³ m ³)	Percentage (%)
		(a)	(b)	(c)	(d)
1	2002	8,677	0.21%	0	0.00%
2	2003	17,458	0.43%	0	0.00%
3	2004	0	0.00%	0	0.00%
4	2005	(8,055)	(0.20%)	0	0.00%
5	2006	0	0.00%	0	0.00%
6	2007	0	0.00%	0	0.00%
7	2008	0	0.00%	0	0.00%
8	2009	(11,751)	(0.28%)	0	0.00%
9	2010	(23,196)	(0.56%)	0	0.00%
10	2011	6,669	0.16%	0	0.00%
11	2012	20,621	0.49%	(54,209)	(1.73%)
12	2013	(747)	(0.02%)	0	0.00%
13	2014	(20,218)	(0.48%)	0	0.00%
14	2015	120	0.00%	0	0.00%
15	2016	5,168	0.12%	0	0.00%
16	2017	0	0.00%	0	0.00%
17	2018	1,652	0.04%	(60,225)	(1.85%)
18	2019	0	0.00%	(13,746)	(0.42%)
19	2020	0	0.00%	0	0.00%
20	2021	(2,601)	(0.06%)	0	0.00%

Notes:

- (1) Negative sign indicates that measured inventory was reduced.
- (2) Adjustments can be attributed to either measurement error or gas migration within the reservoir.
- (3) EGD meter upgrade project was completed in 2012. 2018/19 adjustments based on 2013-2017 measurements.

- i. Enbridge Gas does not operationally segregate its storage facilities as utility or and non-utility. Likewise, storage pool inventory adjustments are not allocated between utility and non-utility storage.

Please see Exhibit 1, Tab 13, Schedule 2, Attachment 1, pages 14-15 for details of the current and proposed methodologies for the allocation of UFG between utility and non-utility storage. This evidence will be addressed in Phase 2 of the proceeding as noted in Enbridge Gas's February 1, 2023 letter.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 3, Schedule 1

Preamble:

We would like to understand better the sources of UFG and the steps that EGI has undertaken to reduce the cost to ratepayers.

Question(s):

Has EGI performed any study to reconcile the heat values it has derived from its measuring equipment to consider whether improving or upgrading its equipment would contribute to reducing UFG?

- a) Has EGI worked with TCE or other companies on a reconciliation?
 - i. If not, why not?
- b) How does EGI test for variations in actual heat value?
 - i. How many chromatographs does EGI employ?
(1) Please provide the locations on the system.
 - ii. Please provide the cost of the installation of a chromatograph from EGI most recent installation.

Response:

- a) Enbridge Gas has not performed any studies to reconcile the heat value results.
 - i. Gas chromatographs that are utilized for custody transfer are required to be Measurement Canada Certified which includes an annual recertification. Conformance to applicable regulatory requirements and application of best practice operational maintenance and diagnostics procedures are sufficient to ensure accurate determination of heating values.
- b) Enbridge Gas does not test for variations in actual heat value.

- i. Enbridge Gas has access to the data of 216 gas chromatographs as outlined in Table 1.

Table 1
Locations & Quantities of GC Data Points

<u>Ownership</u>	<u>Number of GC Data Points</u>	<u>Locations</u>
TCE	159	North, East, Central Delivery Area
Enbridge	56	Interconnects, Storage pools, Dawn Transmission, Napanee
Bluewater	1	Bluewater Interconnect (Marysville, USA)

- ii. The most recent cost estimate to install a gas chromatograph was \$375,000.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 3, Schedule 1

Preamble:

We would like to understand better the sources of UFG and the steps that EGI has undertaken to reduce the cost to ratepayers.

Question(s):

Does EGI have non-utility storage contracts that do not have a fuel component for injections or withdrawals?

- a) If so, how is the fuel provided?
- b) How is that amount reconciled to ensure ratepayers are not subsidizing?

Response:

- a) The market-based storage services that Enbridge Gas has purchased from its non-utility business include fuel requirements for injections and withdrawals. Enbridge Gas has contracted for storage services from third parties that do not include a fuel component for injections and withdrawals. Enbridge Gas is not aware of how these third parties manage any fuel costs that may be applicable to providing the contracted storage service.

For non-utility storage contracts that Enbridge Gas sells to third parties, all contracts contain a fuel provision. In some instances, customers supply fuel at ratios as stated in the Market Priced Storage Services rate schedule. For some contracts, the utility supplies fuel and the customer pays for the fuel as a part of their negotiated demand and commodity charges.

- b) The methodology for the allocation of fuel costs between utility and non-utility storage is provided at Exhibit 1, Tab 13, Schedule 2, Attachment 1, pages 14-15. Please see Exhibit 4, Tab 2, Schedule 1, Attachment 1, page 4, lines 18-20 for detail

of the fuel costs allocated to non-utility storage. Please also see Exhibit 4, Tab 2, Schedule 1 Attachment 1, page 2, line 32 showing the allocation of fuel costs to non-utility storage on an actual and forecast basis.

Storage fuel on market-based storage contracts that is paid for by in-franchise customers is based on contract parameters and is not subject to a true up. Any over/under recovery of fuel is at the risk of the shareholder.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 3, Schedule 1

Preamble:

We would like to understand better the sources of UFG and the steps that EGI has undertaken to reduce the cost to ratepayers.

Question(s):

EGI indicated that it implemented an update to gas quality parameters to derive an improved supercompressibility factor after the 2019 ScottMadden report. Please estimate the under-recovery of gas from 2014-2018 as a result of not updating the gas quality.

Response:

Electronic Volume Correctors (EVC) and Remote Terminal Units (RTU's) are used to convert volumes measured at flowing pressure and temperature to volumes at standard pressure and temperature (i.e., billable volumes). These devices use gas quality parameters to calculate supercompressibility factors which are included in their volume conversion calculations.

Gas quality parameters need to be updated periodically to ensure they are representative of the measured gas and to ensure accurate measurement. Prior to amalgamation, Union had been updating gas quality parameters on an annual basis. However, prior to 2019, EGD was using gas quality parameters that were established over 20 years prior. The impact of using outdated gas quality parameters was a lower supercompressibility factor which resulted in a lower standard (billable) volume. This represented a source of unaccounted for gas.

Table 1 provides the estimated under-recovery of gas volumes for 2014 to 2018 as a result of not updating gas quality parameters.

Table 1
Estimated Under-Recovery of Gas Relating to Gas Quality
Parameters 2014-2018

<u>Line</u> <u>No.</u>	<u>Particulars</u>	<u>Total Volumes</u> <u>(m³)</u>
		(a)
1	2014	2,810,319
2	2015	3,647,781
3	2016	3,360,616
4	2017	3,655,294
5	2018	4,303,286

ENBRIDGE GAS INC.

Answer to Interrogatory from
London Property Management Association (LPMA)

Interrogatory

Reference:

Exhibit 4, Tab 3, Sch. 1, Table 2

Question(s):

- a) Please explain the difference between the actual UFG volumes shown in Table 2 from those shown in Table 3 and Attachment 1.
- b) Is the out-of-sample forecast for Union Current based on a two-year lag using a weighting of 3-2-1? If yes, please explain, as an example, how the 2021 forecast of 171,231 is lower than all of the actual figures shown for 2017, 2018 and 2019. If no, please show mathematically how the Union Current forecast is calculated. If required, please provide a corrected version of Table 2 that calculates the correct figures for the Union Current methodology.
- c) Please provide an expanded version of Table 2 that includes an analysis of a 4 year average methodology.
- d) Please provide an Excel spreadsheet that includes all the historical data used in the calculations, and the calculations used in Table 2, including the requested 4 year average and the correction, if required, for the Union Current methodology.

Response:

- a) The data provided at Exhibit 4, Tab 3, Schedule 1, Table 2 is incorrect. Please see response at Exhibit I.4.2-STAFF-107, Attachment 1, Table 1 for the corrected data and for the updated comparison analysis.
- b) Union's current methodology uses 3-yr weighted moving average on a two-year lag using a weighting of 3-2-1 in determining the UFG volumes to throughput volumes ratio, which is called the benchmarking ratio. The benchmarking ratio used for the Union rate zones is 0.219% as explained in Exhibit 4, Tab 3, Schedule 1. To determine the equivalent benchmarking ratio for Enbridge Gas, the same methodology was used. The UFG throughput ratio was calculated to be 0.37% for Enbridge Gas on a combined basis, which is then multiplied by the forecast

throughput to determine the out-of-sample forecast for each of the relative years. The calculation of the out-of-sample forecast for the Union current methodology is provided in response at Exhibit I.4.2-STAFF-107, Attachment 1, Table 5.

The calculation used for the out-of-sample forecast in Table 2 is correct, but the actual data used for comparison analysis has been corrected.

- c) The methodologies that were compared in Exhibit 4, Tab 3, Schedule 1, Table 2 included the EGD and Union rate zones' current methodologies along with two other commonly used methodologies used by other utilities in North America, specifically the 3-year simple average and 5-year simple average, as provided at Exhibit 4, Tab 3, Schedule 1, paragraphs 10 to 11. None of the utilities examined used a four-year average. However, in response to this question, the 4-year average is added to comparison analysis and the results are provided in response at Exhibit I.4.2-STAFF-107, Attachment 1, Table 1.
- d) Please see response at Exhibit I.4.2-STAFF-107, Attachment 1, Table 1 for the corrected data and for the updated comparison analysis.

ENBRIDGE GAS INC.

Answer to Interrogatory from
London Property Management Association (LPMA)

Interrogatory

Reference:

Exhibit 4, Tab 3, Sch. 1

Question(s):

- a) Please update Table 3 to reflect actual data for 2022.
- b) Please explain how the 2024 forecast of 270,370 shown in Table 3 has been calculated using the historical data in Table 3 and the proposed 3-year simple average.
- c) The evidence at page 12 states that the 3 year average forecast is based on actuals from 2019 through 2021. However, the figures shown in Table 3 for 2019 through 2021 average 279,416. Please reconcile with the figure of 270,370.

Response:

- a) Please see Table 1 for UFG volumes updated for 2022 actual data. 2022 UFG volumes are subject to ongoing analysis. Final balances will be included in Enbridge Gas's 2022 Utility Earnings and Disposition of Deferral & Variance Account Balances Application to be filed in 2023.

			Actual (a)	Actual (b)	Actual (c)	Actual (d)	Bridge Year (e)	Test Year (f)
1	UAF / LUF Volumes	EGD (1)	160,960	130,599	135,918	314,007	127,042	
2	UFG Volumes	Union (2)	121,079	66,056	223,637	218,904	81,738	
3	UFG Volumes	EGI						270,370
4	Total		282,038	196,655	359,555	532,911	208,781	270,370
5	Year-over-Year Variance			(85,383)	162,900	173,356	(324,131)	61,589

Notes:

- (1) EGD rate zone.
- (2) Union rate zones.

b) Please see Table 2 for the calculation of the 2024 UFG forecast of 270,370 10³m³.

Table 2
Determination of 2024 Enbridge Gas UFG Forecast

Line No.	Particulars (10 ³ m ³)	EGI (Utility) (1)	Non-Utility	EGI (Total Utility)
		(a)	(b)	(c)
1	2019	282,038	21,874	303,912
2	2020	196,655	13,365	210,020
3	2021	359,555	34,246	393,801
4	Forecasted UFG volume for 2024 (3-year average)	279,416	23,162	302,578
5	Non-Utility - 10.6445% (2)			32,208
6	Forecasted Utility UFG volume for 2024			270,370

Notes:

- (1) Exhibit 4, Tab 3, Schedule 1, Table 3, line 4.
- (2) Allocation calculated based on proposed methodology Exhibit 1, Tab 13, Schedule 2, Section 2.4. This evidence will be addressed in Phase 2 of the proceeding as noted in Enbridge Gas's February 1, 2023 letter.

- c) The 2024 Utility UFG Forecast of 270,370 10^3m^3 is calculated by taking the 3-year simple average of the Total Utility UFG volumes for 2019 to 2021 less the allocation of non-utility UFG volumes as shown in column (c) in Table 2. This differs from the 3-year simple average of Utility volumes in column (a) line 4 of 279,416 in Table 2.

Enbridge Gas operates its assets on an integrated basis and does not operationally segregate them as utility vs non-utility. As such, Total Utility UFG is more indicative of expected UFG volumes. On that basis, it is appropriate to use the 3-year simple average of Total Utility UFG and then apply an allocation of non-utility UFG to determine the forecast of utility UFG volumes.

ENBRIDGE GAS INC.

Answer to Interrogatory from
London Property Management Association (LPMA)

Interrogatory

Reference:

Exhibit 4, Tab 3, Sch. 1

Question(s):

- a) Please provide the historical data used and the regression statistics noted in paragraph 12 for the regression equation methodology. Please provide the information in an Excel spreadsheet.
- b) What is the basis for the determination that the regression methodology was not an appropriate method to forecast UFG?

Response:

- a) The data provided at Exhibit 4, Tab 3, Schedule 1, Table 2 is incorrect. Please see response at Exhibit I.4.2-STAFF-107, Attachment 1, Table 1 for the corrected data, and Table 4 for the data used to estimate the regression model and an updated regression model.
- b) The regression model used to estimate Enbridge Gas's UFG is not statistically significant with very-low R-squared. The insignificant t-test statistic results for the unlocks variable, low R-squared, and insignificant F-statistics show that the unlocks variable is not statistically significant in terms of determining the changes in combined UFG volumes for Enbridge Gas. The accuracy comparison analysis has been updated to include the regression results and is provided at Exhibit I.4.2-STAFF-107, Attachment 1, Table 1.

ENBRIDGE GAS INC.

Answer to Interrogatory from
School Energy Coalition (SEC)

Interrogatory

Reference:

4-3-4, p.1, p.4-5

Question(s):

With respect to Table 1:

- a) Please provide a revised version of Table 1 that shows company name.
- b) For each utility whose methodologies is categorized as “other methodology”, please explain the methodology and provide reference to any publicly available information that documents it.
- c) For each utility listed, please provide flow-through for the impacts to customers of the variance between forecast and actual UFC, similar to those that Enbridge has and proposed to do through use of a variance account.

Response:

- a) Please see Attachment 1 for a revised version of Table 1 that shows company name.
- b) The following explanations are provided for the utilities listed in Table 1 whose methodologies are categorized as “Other methodology”:
 - Consolidated Edison Company: This utility should have been categorized as “5 Year Average”. Attachment 1 has been updated accordingly. The UFG percentage is calculated annually based on the five-year average. Reference can be found at:
<https://documents.dps.ny.gov/public/Common/ViewDoc.aspx?DocRefId={7D0D5A6A-E80B-4142-A6CC-C505FE860704}>

- Columbia Gas of Ohio (NiSource): UFG percentage is calculated annually based on the 12 months ending August 31 each year. Reference can be found at: <https://codes.ohio.gov/ohio-administrative-code/rule-4901:1-14-01>
 - Columbia Gas of Pennsylvania (NiSource): This utility should have been categorized as “3 Year Average”. Attachment 1 has been updated accordingly. The UFG percentage is calculated annually based on the three-year average. Reference can be found at: <https://www.columbiagaspa.com/docs/librariesprovider14/rates-and-tariffs/pennsylvania-tariff.pdf>
 - Nicor Gas – UFG percentage is calculated annually based on 12 months ended June 30. Reference can be found at: [https://www.nicorgas.com/content/dam/southern-co-gas/rates-and-riders/2020-rates-and-riders-/april-2020-rates-and-riders/april-2020-early/covid-19-tariff-updates/Nicor Terms and Conditions Full.pdf](https://www.nicorgas.com/content/dam/southern-co-gas/rates-and-riders/2020-rates-and-riders-/april-2020-rates-and-riders/april-2020-early/covid-19-tariff-updates/Nicor_Terms_and_Conditions_Full.pdf)
- c) Enbridge Gas’s review of publicly available information did not reveal the regulatory treatment of variances between actual and forecast UFG variances for all the utilities listed. On a best efforts basis, Enbridge Gas has summarized in Attachment 2 its understanding of the impacts to customers of the variances between forecast and actual UFG for each utility listed in Table 1.

Answer to Interrogatory from
School Energy Coalition (SEC)

Interrogatory

Reference:

4-3-4, p.10

Question(s):

Please provide a revised version of Table 3, showing information on a weather normalized basis. Please provide the information back to 2013.

Response:

Enbridge Gas has assumed this interrogatory is referencing to Table 3 (UFG Volume) in Exhibit 4, Tab 3, Schedule 1, page 10.

Please see Attachment 1 for the estimation of UFG Volumes on a weather normalized basis.

Weather normalized UFG volumes have been estimated by applying weather the normalization adjustment to the UFG volumes in Table 3. The weather normalization adjustment is calculated by dividing the normalized throughput volumes provided at Exhibit 3, Tab 3, Schedule 1 by the unnormalized throughput volumes provided at Exhibit 3, Tab 3, Schedule 7.

UFG Volumes (weather normalized)

ENBRIDGE GAS INC.

Answer to Interrogatory from
Vulnerable Energy Consumers Coalition (VECC)

Interrogatory

Reference:

Exhibit 4, Tab 3, Schedule 1, page 10, Table 3

Question(s):

“Enbridge Gas proposes to determine the forecast for UFG based on a 3-year simple average of actual UFG volumes.”

- a) We are unable to replicate a three year simple average for the total UFG amount in 2024 test year of 270,370 10^3m^3 as shown in Table 3. Please show the derivation of this figure.
- b) Is the 3 year average derived from only past actual amounts or does the 2024 year use the 2023 UFG forecast?

Response:

- a) Please see response at Exhibit I.4.3-LPMA-30 part b).
- b) The 2024 Test Year Forecast is calculated using the 3-year average which is based on actual amounts from 2019, 2020 and 2021. Please see response at Exhibit I.4.3-LPMA-30 part b) for the detailed calculation of the 2024 Test Year Forecast of 270,370 10^3m^3 .

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 2, p. 6

Question(s):

At the above reference when explaining anticipated increases in OM&A, it is stated that:

In 2023, bad debt and Technology and Information Systems (TIS) costs related to migration to 'as a service' models to enhance technology reliability and training, change management and sustainment associated with harmonized systems will be a key driver along with drivers mentioned for 2022.

- a) Please explain the differences between 'as a service' models and those models presently used by Enbridge Gas and how the use of these models will enhance technology reliability and training.
- b) Please state how Enbridge Gas determined that the increased costs of these models justified the incremental benefits expected from them relative to the current models being used.
- c) Please state why sustainment associated with harmonized systems would increase costs and to what extent the harmonization of the affected systems would produce offsetting cost reductions.

Response:

- a) Please see response at Exhibit I.4.4-STAFF-142 part a).
- b) Please see response at Exhibit I.4.4-SEC-176 part b).
- c) Specifically in 2022, there was an increase in costs related to the sustainment of the Customer Information System due to migrating an additional 1.6 million residential customers onto a single system in 2021. For an explanation of the incremental sustainment costs, please see response at Exhibit I.1.8-STAFF-128. The integration savings, which would have been delivered through the harmonization of systems for

the Customer Care function is provided at Exhibit 1, Tab 9, Schedule 1.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 2, p. 8

Question(s):

At the above reference, it is stated that:

Synergies are defined as cost savings that were delivered through integration initiatives under conditions made possible by amalgamation. These synergies include the 2019 initial Enbridge Gas organization restructuring and role rationalization and the 2020 Voluntary Workforce Options (VWO) Program which incentivized employees to retire early, take leave, pursue part-time or job-sharing arrangements, or voluntarily exit. While VWO was an Enbridge initiative in response to COVID-19, its implementation in 2020 led to swifter role rationalization by advancing resourcing reductions that were expected over the amalgamation period leading up to rebasing.

- a) Please state the criteria used by Enbridge Gas to distinguish a saving arising from amalgamation to one arising from COVID-19 impacts.
- b) Please state the extent to which the VWO impacted the calculated merger savings.

Response:

- a) The criterion used to distinguish a saving arising from amalgamation is that the savings opportunity was directly related to integration of the two legacy entities and that savings had to be sustainable, whereas COVID-19 impacts are deemed unrelated to integration and not perpetual in nature.
- b) VWO facilitated further role and program rationalization to expedite synergy savings as a result of the amalgamation of EGD and Union. The savings related to VWO are \$18.8 million annually. Please see Exhibit 1, Tab 9, Schedule 1, page 9 for further details.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 2, p. 8

Question(s):

At the above reference, it is stated that in addition to synergies, other initiatives which did not require integration resulted in productivity savings and that productivity savings have been achieved across all operating areas during the deferred rebasing term.

Please state the criteria used by Enbridge Gas to distinguish a productivity saving from normal prudent business practice.

Response:

Enbridge Gas did not distinguish between productivity savings and normal prudent business practice. The criterion for identifying a productivity savings was an initiative that resulted in savings that were not dependent on the integration of EGD and Union relative to the practice in place at the time.

Although integration was not required to achieve benefits of the aforementioned productivity savings, productivity was driven by sharing information and applying successful business practices applied within one legacy entity to the other. As provided at Exhibit 4, Tab 4, Schedule 2, paragraph 16, one such example of productivity savings was the success of higher adoption of e-billing within the EGD rate zone. Although both legacy entities would have approached this through prudent business practices, further savings were achieved by sharing information across the larger entity.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 2, pp. 8-9

Question(s):

At the above reference, Table 2 “Integration Synergies and Productivity Savings” is provided and includes information for the period 2019 to 2024. For the 2024 Test year, \$35.2 million of productivity savings are shown.

In explaining these savings, it is stated that:

Gross O&M reductions of \$20.7 million (\$13.9 million net O&M) and \$28.5 million (\$18.1 million net O&M) have been included in the 2023 Bridge Year and 2024 Test Year, respectively. The net O&M embedded productivity for the 2023 Bridge Year and the 2024 Test Year is included in each year’s productivity savings in Table 2. The 2024 Test Year contains a reduction in salaries & wages of \$7 million and other cost categories of \$21.5 million, primarily factored into the forecasts for Operations and Engineering & STO. The cost component and departmental breakdown of the embedded productivity amounts are preliminary estimates as the Company has not conclusively identified the additional productivity opportunities.

- a) Please state how and when these savings will be identified and whether or not Enbridge Gas will file an update to the application to reflect them.
- b) In the explanation provided above, it is stated that the 2024 Test Year contains a reduction in salaries and wages of \$7 million and other cost categories of \$21.5 million:
 - i. Please reconcile these two numbers, which add up to \$28.5 million with the \$35.2 million shown in Table 2
 - ii. Please provide a breakdown of the other cost categories of \$21.5 million.

Response:

- a) Identification of opportunities to achieve the embedded productivity will occur throughout 2023 and 2024. Enbridge Gas is not planning to file an update related to embedded productivity.
- b)
- i. Embedded productivity is included along with identified productivity initiatives in the total productivity savings of \$31.0 million net O&M for the 2023 Bridge Year, and \$35.2 million net O&M for the 2024 Test Year. Embedded productivity accounts for \$13.9 million of net O&M (\$20.7 million gross O&M) and \$18.1 million of net O&M (\$28.5 million gross O&M) in the total productivity savings for the 2023 Bridge Year and 2024 Test Year, respectively.
 - ii. Please see Table 1 for category breakdown of the \$21.5 million gross O&M non-labour embedded productivity for 2024. This breakdown is a preliminary estimate as the Company has not conclusively identified the productivity opportunities.

Table 1
O&M Cost Categories

Line No.	Particulars (\$ millions)	2024 Test Year
1	Contract Services	9.4
2	Materials & Supplies	1.9
3	Fleet & Fuel	0.4
4	Other O&M	9.8
5	Total	21.5

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 2, p. 9

Question(s):

At the above reference, it is stated that at this time, while opportunities for additional productivity savings have not been identified, productivity savings have been embedded to reflect committed savings which the Company will strive to manage. It is further stated that these embedded productivity savings allow the Company to maintain O&M below the level of inflation for the 2024 Test Year.

Please provide the productivity savings referred to above, that have been embedded in the OM&A costs and explain how the company will achieve these savings.

Response:

Please see response at Exhibit.I.4.4-STAFF-113.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 2, p. 13,
Exhibit 4, Tab 4, Schedule 2, p. 15-16
Exhibit 9, Tab 1, Schedule 4, p. 2, p. 6 and p. 25

Question(s):

At the first reference, it is stated when discussing Business Development & Regulatory (BD&R) costs that:

Significant O&M reductions due to synergies resulting from restructuring and lower spend due to the impact of COVID-19 in 2019 and 2020 were later offset by the resumption of activity from the easing of COVID-19 restrictions starting in 2021 and carrying into 2022 as well as impacts due to significant inflationary pressures. In addition, the Test Year includes costs recovered in deferral accounts in 2023 and earlier in the amount of \$7.1 million.

At the second reference, it is stated when discussing BD&R costs for the 2024 Test Year versus 2023 Bridge Year that:

The \$4.3 million increase in salaries & wages includes \$1.8 million in FTE additions for IRP and \$1.4 million for administrative staff related to compliance with federal and provincial GHG emission regulations previously recovered through the IRP Operating Costs Deferral Account (IRPOCDA) and the GHG Emissions Administration Deferral Account (GHGEADA). The remaining increase in salaries & wages is due to merit. Contract services is forecast to increase by \$3 million which includes \$3.9 million for OEB costs previously recovered through the OEB Cost Assessment Variance Account (OEBCAVA) partially offset by the elimination of \$1.5 million in rebasing hearing and intervenor costs from 2023.

At the third reference, it is stated that Enbridge Gas is not proposing changes to the IRPOCDA and the GHGEADA, beyond account number changes and harmonization. In relation to OEBCAVA, it is stated that the OEB directed regulated entities to cease recording amounts in these accounts when their rates are rebased, incorporating any updated forecast of cost assessments.

- a) Please confirm that the first reference to COVID-19 impacting the 2019 and 2020 spending levels only applies to 2020, or if not, please explain.
- b) In relation to IRPOCDA and GHGEDA, please explain why costs are being recovered as O&M expenses given that Enbridge Gas is proposing to continue the respective deferral and variance accounts.

Response:

- a) Confirmed. The COVID-19 impact only applies to 2020.
- b) With respect to integrated resource planning, included within the Company's 2024 Test Year budget are the forecast ongoing administrative costs that have resulted from incorporating integrated resource planning requirements and procedures into its operations. These costs have been included in the 2024 forecast of costs, such that rates will reflect the ongoing cost of doing business. The Company would like to clarify that it is not requesting variance account treatment related to these ongoing costs. The Company has proposed the continuation of the IRPOCDA in order to capture incremental operating, administrative, and evaluation costs that result from approved IRP plans, which were not able to be forecast, or incremental operating and administrative impacts that result from IRP rules/requirements/guidelines that may continue to change or evolve.

Similarly, the Company has included its forecast ongoing administrative costs of complying with current greenhouse gas emissions regulations (excluding bad debt) within the 2024 Test Year budget, which again will allow rates to reflect the ongoing cost of doing business. To again clarify the Company's proposal for the Greenhouse Gas Emissions Administration Variance Account, as was articulated in the proposed accounting order provided at Exhibit 9, Tab 1, Schedule 1, Attachment 3, page 17, and the evidence provided at Exhibit 9, Tab 1, Schedule 2, paragraphs 79 to 82, the Company is proposing that the ongoing administrative costs of complying with current greenhouse gas emissions regulations (excluding bad debt) not be subject to annual variance account true-up. The Company is proposing that the GGEAVA only capture incremental administrative impacts related to new or changing climate regulations, which continue to evolve. With regards to bad debt, the Company's proposal is to capture all bad debt related to carbon charges in the GGEAVA, as the significant increase in carbon prices anticipated to occur over the 2025 to 2028 IR term cannot be factored into the base 2024 Test Year Forecast.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 2, p. 15

Question(s):

At the above reference, it is stated when discussing BD&R costs for the 2022 estimate versus 2021 actuals that one aspect contributing to the increase was:
Increases in contract services and other O&M spend is primarily due to investigative costs relating to potential capital projects and the resumption of travel, employee training, and normal levels of marketing and public affairs activities.

- a) Please explain the investigative costs relating to potential capital projects, in particular, the criteria used to determine these costs. Please also provide the actual 2022 costs and explain any variance from forecast.
- b) Please state whether Enbridge Gas's travel costs are expected to return to pre pandemic levels, or whether Enbridge would anticipate that these costs would be permanently lower as a result of new practices developed during the pandemic such as increased use of virtual meetings. If the costs would be expected to be lower, please state the extent of the reductions, if not, please explain why not.

Response:

- a) The potential capital project provided at Exhibit 4, Tab 4, Schedule 2, page 15 relates to a specific project, Advanced Metering Infrastructure (AMI). AMI is in the initial stages of project development, evaluation of strategic direction, and proof of concept. The investigative costs relating to AMI in 2022 were \$0.9 million of actuals, the variance compared to forecast of \$1 million is \$0.1 million. These are deemed as investigative costs because the project is in the initial planning stages and not yet approved as a capital project.
- b) The BD&R travel costs are not expected to return to pre-pandemic levels. The forecast for 2024 is 18% lower than 2019 actuals.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 2, pp. 15-16

Question(s):

At the above reference, it is stated when discussing BD&R costs for the 2024 Test Year versus the 2023 Bridge Year that a couple of elements of the increase were:

The remaining increase in salaries & wages is due to merit. Contract services is forecast to increase by \$3 million which includes \$3.9 million for OEB costs previously recovered through the OEBCAVA partially offset by the elimination of \$1.5 million in rebasing hearing and intervenor costs from 2023.

- a) Please elaborate on what is meant by the remaining increase in salaries and wages is due to merit. In particular, please provide the amount of this increase that is included in the 2024 Test Year.
- b) Please provide the amount that is incorporated in the 2024 Test Year for OEB and other regulatory costs and provide a breakdown of these costs. Please state whether or not Enbridge Gas would expect these costs to decline in the 2025 to 2028 period and if not, why not.

Response:

Enbridge Gas notes the following corrections to Exhibit 4, Schedule 4, Tab 2. In paragraph 27, the reference to costs recovered in deferral accounts in 2023 and earlier should be \$6.8 million, instead of \$7.1 million. In paragraph 33, the reference of OEB costs previously recovered through the OEBCAVA was incorrectly stated as \$3.9 million. The correct number should have been \$3.6 million.

Enbridge Gas would also like to clarify the variance explanation of BD&R cost 2024 Test Year vs 2023 Bridge Year in paragraph 33. The updated paragraph 33 is as follows with changes underlined:

2024 Test Year costs are expected to be \$7.6 million higher than 2023 Bridge Year. A significant portion of this increase is due to costs previously not reflected in rates but recovered through deferral accounts in 2023 (and earlier), which are now included in the 2024 Test Year Forecast under salaries & wages and contract services. The \$4.3 million increase in salaries & wages includes \$1.7 million in FTE additions for IRP and \$0.9 million for administrative staff related to compliance with federal and provincial GHG emission regulations previously recovered through the IRP Operating Costs Deferral Account (IRPOCDA) and the GHG Emissions Administration Deferral Account (GHGEADA). The remaining increase in salaries & wages of \$1.7 million is due to merit and other FTE additions for energy transition, implementation of the rebasing decision and Business Development initiatives. Contract services is forecast to increase by \$3 million which includes \$3.6 million for OEB costs previously recovered through the OEB Cost Assessment Variance Account (OEBCAVA) partially offset by the elimination of \$1.5 million in rebasing hearing and intervenor costs from 2023. Please see Exhibit 9, Tab 1, Schedule 1 for more information on deferral and variance accounts. The remaining \$0.9 million variance is due to \$0.5 million in consulting and marketing increases to support energy transition and community expansion projects and \$0.6 million in other non-labour costs such as consulting, legal, travel and other employee related expenses previously recovered through the IRPOCDA and GHGEADA offset by \$0.2 million in other small decreases.

The updates noted above have no impact on the 2024 O&M forecast.

- a) From 2023 to 2024, the \$4.3 million increase in salaries & wages is primarily driven by FTE additions previously recovered through the IRP Operating Costs Deferral Account (IRPOCDA) and the GHG Emissions Administration Deferral Account (GHGEADA) now included in the 2024 Test Year Forecast. The remaining increase in salaries & wages is due to merit and other FTE additions as noted in the updated paragraph 33 above. The merit included in the 2024 Test Year was \$0.7 million.
- b) In the 2024 Test Year, OEB and other regulatory costs are forecasted to be \$11.4 million, consisting of \$8.7 million in OEB assessment costs and \$2.7 million in other proceeding related regulatory costs. From 2025 to 2028, Enbridge Gas expects these costs to increase by inflation. Costs are not declining due to OEBCAVA previously recovered through the deferral was added to the 2024 Test Year.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 2, pp. 22

Question(s):

At the above reference, it is stated when discussing Customer Care costs for the 2023 Bridge Year versus the 2022 Estimate that:

The other O&M decrease of \$2.8 million is primarily driven by unapplied customer payments where the Company has exhausted efforts to identify customers and refund payments.

Please state how Enbridge Gas determines when it has exhausted efforts to identify customers and refund payments and what the time frame is for making this determination.

Response:

Enbridge Gas takes the following steps to try and identify the appropriate customer and apply or refund payments:

1. Search Enbridge Gas database to match customer name, address, and phone number to any existing account in the system. If matched, the team contacts the customer and verifies all appropriate information before applying a payment to the existing account or refunding the payment.
2. Call and/or send a letter to the last known phone number and address asking the customer to contact Enbridge Gas. In some cases, there is a forwarding address that can result in reaching the appropriate customer. Mobile phones are more often kept and are also utilized to successfully reach the appropriate customer.
3. Internet searches are used to look for a match by name or address. This works best for commercial accounts that may have moved.

4. Accounts assigned to one of our third-party collection agencies to do a trace through TransUnion or Equifax. (These are non-credit searches so there is no impact to customer credit rating)

Accounts are reviewed on an ongoing basis and the time frame in determining when the efforts have been exhausted can be up to 2 years.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 2, pp. 22 and Table 4, p.18

Question(s):

At the first reference above, it is stated when discussing Customer Care costs for the 2024 Test Year versus the 2023 Bridge Year that a couple of elements of the increase were:

2024 Test Year costs are forecast to be \$11.2 million higher than 2023 Estimate. The main driver is an increase in bad debt due to higher arrears as a result of the prolonged effect of higher commodity prices, economic conditions, and inflation in addition to higher consumer indebtedness.

At the second reference above, actual bad debt costs are shown as \$10.6 million, \$9.0 million, \$10.7 million and \$13.2 million for the years 2018 to 2021, while the 2024 Test Year level is shown as \$21.5 million, which is a very substantial increase over the levels in these years. It is also a substantial increase over the 2023 Bridge Year level of \$17.5 million, representing about a 14% year over year increase.

Please state whether or not Enbridge Gas undertook any studies to determine that the proposed 2024 Test Year level of Bad Debt expense was appropriate and if so, please provide such studies. If not, please state how this proposed expense level was calculated, including methodology and inputs. Please also explain how the expense level for Bad Debt was determined to be appropriate.

Response:

Enbridge Gas did not undertake any studies to determine the proposed 2024 bad debt expense. The 2024 bad debt expense of \$21.5 million is calculated by applying the 0.42% bad debt write off rate to the sales forecast for 2024.

Enbridge Gas writes off accounts approximately 2 years after the account has been closed and all collections efforts have been exhausted. Enbridge Gas administers the following collections strategies in order to collect past-due accounts.

Accounts Between 30-120 days

- Invoices and reminders sent monthly for all current and past due balances
- Past due accounts are called by the collections team along with correspondence sent to all customers in arrears.

If there is no response and the customer has not made any attempt to call and/or make a payment or payment arrangement, a disconnections letter may be sent between 60 and 120 days (depending on moratorium as per GDAR requirements).

After an account has been closed with a past due balance, Enbridge Gas continues to contact customers with reminders of past due balances for an additional 60 days. After 60 days accounts are sent to third party collection agencies and continue to be called until the appropriate 2-year time frame expires, and the account is written off.

The bad debt write-off rate is calculated by taking the write-off dollars for that year over the sales for the related sales year. For example, bad debt write-off for 2022 is related to sales for 2020.

For 2023 and 2024, bad debt and delinquency dollars (total dollars of closed accounts) increased from previous years as a result of higher arrears due to the prolonged effects of higher commodity prices, economic conditions, inflation and limited programs to help customers pay their arrears. Through the pandemic, support programs were in place, such as the Ontario government's COVID-19 Energy Assistance Program (CEAP), to help customers manage overdue balances. CEAP provided \$14.6 million to Enbridge Gas customers in need of support. In addition, during the pandemic there were periods where collections activities, including locking, were paused to help support customers, which resulted in increased delinquency dollars and write-offs.

Historical and future trends:

When reviewing historical trends, Enbridge Gas tracks the relationship between sales, delinquency dollars and write-off rates. The percent of delinquency dollars for closed and disconnected accounts aligns with write-off rates as provided in Table 1.

Table 1
Percent of Delinquency Dollars

	2020	2021	2022
Delinquency Rate	0.16%	0.39%	0.47%
Write-off Rate	0.12%	0.34%	0.42%

For 2024, Enbridge Gas has determined that 0.42% write-off rate was appropriate based on historical write-off rates and current economic factors as presented in Table 2.

Table 2
2024 Bad Debt

<u>2024 Forecast (\$ millions)</u>	
Sales forecast	7,870
Write-off Rate	0.42%
Write-off Amount	33.1
Less estimated bad debt from carbon	<u>(11.6)</u>
Bad Debt	21.5

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 2, p. 25 and p. 15

Question(s):

At the first above reference, it is stated when discussing the Operations Group's functions that:

Major Projects manages and executes capital projects for Enbridge Gas, providing functions such as engineering, construction planning, project management and project governance. Since this group is dedicated to capital projects, associated O&M costs are fully capitalized resulting in no impact on utility O&M.

At the second reference above, it is stated when discussing increases in BD&R group costs that:

Increases in contract services and other O&M spend is primarily due to investigative costs relating to potential capital projects and the resumption of travel, employee training, and normal levels of marketing and public affairs activities.

Please state why investigative costs related to potential capital projects are not also capitalized.

Response:

The potential capital project is Advanced Metering Infrastructure (AMI), which is in the initial stages of project development, evaluation of strategic direction, and Proof of Concept. The investigative costs are not capitalized because the project is in the initial planning stages and not yet approved as a capital project.

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 2, p. 27

Question(s):

At the above reference, it is stated when discussing Operations costs increases for 2019 Actuals versus 2018 Actuals that:

Contract services was also impacted by the cancellation of the Company's aviation contract resulting in a termination fee of \$3.5 million which ultimately resulted in future annual savings of \$2.5 million starting in 2020.

- a) Please explain the purpose of the aviation contract and the service provided under this contract. Why did the company cancel the aviation contract?
- b) Please explain how the \$2.5 million annual future savings were derived?

Response:

- a) The purpose of the aviation contract was to provide Enbridge Gas senior leadership with access to air transportation to facilitate travel throughout Ontario on a regular basis including between Toronto and Chatham as well as more remote areas such as those in Northern Ontario. Following the amalgamation, the contract was reassessed and cancelled because the level of senior leadership in the Chatham area was decreasing, access to the Toronto hub had become more accessible, and there was increased use of virtual collaboration technology.
- b) \$2.5 million represents the annualized contract rate. Since the fee is no longer paid, it is considered an annual saving after 2019.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 2, p. 33

Question(s):

At the above reference, it is stated when discussing Operations costs increases for the 2022 Estimate versus 2021 Actuals that:

Further pressure on the cost of locates is driven by the introduction of Bill 93 which was passed into law on April 14, 2022. The new regulations mandate absolute liability compliance for 5 day and 10 day locate deliveries depending on the scope of the excavation project.

Please provide Enbridge Gas's forecasts of the cost impacts of Bill 93 for the 2023 to 2024 period.

Response:

Enbridge Gas has included a conservative amount in the 2023 and 2024 forecast for locate cost increases. The forecast takes into account inflation, cost pressures from various sources, and early estimates from 2022 of the impacts related to Bill 93. The locate forecast for external locate costs was determined based on historical locate request volumes and the average cost of delivering a locate plus inflationary increases. Internal locate costs were determined by the full time equivalent (FTE) resources required to manage and support the execution of the locate delivery process including year-over-year wage increases. Please see Table 1 for locate cost forecast for the 2023 Bridge Year and 2024 Test Year¹ relative to 2022. A portion of the anticipated cost increase expected is included in this forecast with a significant level of cost uncertainty related to Bill 93 still remaining.

¹ Enbridge Gas filed a correction to the 2024 locate costs described at Exhibit 4, Tab 4, Schedule 2 and Exhibit 9, Tab 1, Schedule 3 on March 8, 2023. The 2024 locate costs had previously been stated as \$51.1 million, including \$45 million for operating and maintenance costs for external services and \$6.1 million for internal company resources that provide administrative support.

Table 1
Locate Cost Forecasts

Line No.	Particulars (\$ millions)	2022 Actuals	2023 Bridge Year	2024 Test Year (1)
		(a)	(b)	(c)
1	External Costs	39.9	48.2	51.1
2	Internal Costs	6.5	7.1	7.5
3	Total	46.4	55.3	58.6
4	Change from Prior Year	-	8.9	3.3

Note:

(1) Exhibit 4, Tab 4, Schedule 2, paragraph 85 and Exhibit 9, Tab 1, Schedule 3, paragraph 23, updated March 8, 2023.

Given the cost uncertainty, Enbridge Gas is proposing a new Locate Delivery Service Variance Account (LDSVA) to record the variance between the external locate costs of \$51.1 million and the actual external costs for locate delivery services. This will include the costs for Enbridge Gas to deliver locate services, but also the costs incurred by Enbridge Gas to request a locate for the provision of its own services, as it is expected that other third parties will also initiate a fee for locate services. Enbridge Gas has also proposed to record the revenue collected (net of bad debt costs) from the proposed service charge in the LDSVA as an offset to the increased costs.

Enbridge Gas forecasts that the cost impacts of Bill 93 for the 2023 to 2024 period includes but is not limited to onboarding additional locate resources with robust training, office resources for new reporting requirements by Ontario One Call, increased quality assurance activities and contractor management and oversight. Prior to 2023 there were no actual cost impacts from Bill 93 as the regulations do not come into effect until April 1, 2023.

Enbridge Gas expects external costs for locate services to materially increase from the forecast in response to increased locate delivery compliance requirements as a result of Bill 93 legislation. These costs are currently expected to increase by \$20 million to \$45 million but may vary based on evolving industry factors as well as any third-party charges that may be incurred should others choose to charge for locates as well. These new cost pressures as a direct result of Bill 93 compliance requirements are difficult to definitively quantify as they are subject to multiple external factors with high levels of variability. Dramatically increased efforts to compete, market, attract, and retain new quality locator resources despite Ontario's current labour challenges are a critical requirement of Enbridge Gas and its service providers as result of Bill 93 legislation.

Enbridge Gas forecasts an annual incremental cost impact primarily as a result of Enbridge Gas service providers onboarding and retaining 500 or more new contractor locators at a fully loaded annual rate in the approximate range of \$50,000 to \$80,000 per locator. Internal FTEs will be onboarded as necessary for the management and oversight of contractors to ensure the safety and compliance of contractor service deliveries. This number is not yet known.

In response to anticipated cost increases, Enbridge Gas's proposed new locate delivery service charge is intended to cover the costs associated with delivering locates to third party contractors. While there may be bad debt associated with collecting the new service charge, the charge is intended to protect Enbridge Gas customers from subsidizing the cost of locates associated with other utilities' and municipalities' excavation projects. The proposed service charge will not be applied to Enbridge Gas customers requiring locates for their private property.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 2, p. 34

Question(s):

At the above reference, it is stated when discussing Operations costs increases for the 2022 Estimate versus 2021 Actuals that:

The increase in other O&M is driven by multiple cost pressures along with offsetting decreases. The primary driver of the increase is due to an accounting presentation change that reflects damage recoveries as other revenue instead of as an offset to O&M expense. Although there is no net impact to utility earnings, this adjustment causes a \$6.2 million increase to other O&M

- a) Please state why this change was made.
- b) Please provide the amounts of damages recoveries by year for the 2018 to 2024 period.

Response:

- a) The change was made to align with US GAAP ASC 606 accounting standards. ASC 606 requires that an organization determine whether it is a principal or an agent in a transaction to determine whether that transaction should be recognized gross (as revenue) or net (an offset to O&M). Enbridge Gas re-assessed its damage recovery transactions and determined it was the principal in damage recoveries and therefore should recognize these transactions gross (revenue). This change only impacts Enbridge Gas financial statement other revenue and O&M line items and has no financial impact on net income.
- b) Amounts of damage recoveries are as follows:

Amounts presented in O&M:
2018 - \$7.0 million
2019 - \$7.6 million

2020 - \$7.5 million
2021 - \$5.8 million

Amounts presented in other revenue¹:

2022 - \$5.6 million (actuals)
2023 - \$6.4 million (forecast)
2024 - \$6.6 million (forecast)

¹ Exhibit 3, Tab 5, Schedule 1, p.3, Table 1, line 3.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 2, p. 37

Question(s):

At the above reference, it is stated when discussing Operations costs increases for the 2024 Test Year versus the 2023 Bridge Year that:

The new regulations under Bill 93 are expected to cause significant changes to locate delivery services in Ontario. The 2024 Test Year Forecast includes \$51.1 million for locate delivery costs. \$45 million of the costs are for locate delivery services provided to customers and locate delivery services required for Enbridge Gas's own operations. \$6.1 million of the costs include internal company resources that provide administrative support to respond to locate requests. The changes to be implemented under Bill 93 are currently in development given how recently the legislation was implemented. Enbridge Gas expects the external costs for locate delivery services to materially increase from the amounts included in the 2024 Test Year Forecast as a result of the mandate of absolute liability compliance for five-day and ten-day locate deliveries depending on the scope of the excavation project.

- a) The 2024 Test Year forecast includes \$45 million of operating and maintenance costs for external services to be incurred by Enbridge Gas to provide locate delivery services to customers and for receiving locate delivery services from other third-party providers and other utilities required for Enbridge Gas's own operations. Please explain how the \$45 million in additional costs was calculated.
- b) Will Enbridge Gas require to hire additional FTEs or contractors to respond to changes in providing locate delivery services as a result of Bill 93? If yes, please provide details including the number of FTEs/contractors that will be required.

Response:

a-b) Please see response at Exhibit I.4.4-STAFF-122.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 2, p. 49

Question(s):

At the above reference, it is stated when discussing Engineering and Storage & Transmission Operations (STO) costs increases for the 2022 Estimate versus the 2021 Actual that:

The 2022 Estimate is expected to be \$34.5 million higher than the 2021 actual. The primary driver of the increase is higher contract services of \$21.8 million to address the backlog of work created by COVID-19's impact as well as higher planned IMP inspections as a result of risk modelling enhancements.

- a) Please provide the amounts related to higher planned IMP inspections as a result of risk modelling enhancements for the 2019 to 2022 period.
- b) Please explain the results of the risk modelling and the reasons for the increase in the risk profile.
- c) Please also comment on the outlook for IMP spending beyond 2023 and the potential for costs to remain at higher than historic levels.

Response:

- a) Risk modelling enhancements should be more appropriately termed risk reduction enhancements; these additional measures are to ensure the safety of the public and our employees and the safety and reliability of our assets.

Risk Reduction Enhancements include the following:

- Implementation of the Enbridge-wide Integrity Management Framework Standard (IMFS)

- Creation of a dedicated Facilities Integrity Management Program (FIMP), including a dedicated inspection program
- Evolving the Transmission Integrity Management Program (TIMP) to identify, assess, inspect for, and mitigate additional threats on the system.

Inspection plans vary year-to-year: please see Exhibit 4, Tab 4, Schedule 2, page 47, paragraph 108 for more details on inspection plans.

Amounts related to the increase in IMP inspections resulting from risk reduction enhancements for 2019 - none, 2020 – none, 2021 -\$9.2 million, and 2022 - \$10.9 million (forecast) and \$9.4 million (actual). The 2022 actual to forecast variance of \$1.5 million resulted from weather variability preventing planned inspections near year end.

Table 1
IMP and IMFS Cost summary

Line No.	Particulars	<u>2019</u>	<u>2020</u>	<u>2021</u>	<u>2022</u>	<u>2023</u>	<u>2024</u>
		Actual	Actual	Actual	Actual	Bridge Year	Test Year
		(a)	(b)	(c)	(d)	(e)	(f)
1	IMFS*	0.0	0.0	0.8	4.9	5.3	4.6
2	FIMP Administrative	0.0	0.0	0.7	1.2	1.6	1.6
3	FIMP Inspections	0.0	1.6	2.5	4.3	5.2	6.2
4	IMP	18.8	16.4	20.5	29.4	38.7	37.5
5	Total	18.8	18.0	24.5	39.8	50.8	49.9

* IMFS costs are embedded in the IMP program, estimated amounts have been provided.

- b) The above-mentioned programs have been implemented by Enbridge Gas to ensure that potential threats to our transmission, facilities and distribution systems are monitored appropriately to allow proactive measures to be taken to ensure safety and reliability. Not monitoring active threats could introduce an implicit risk to the system. The risk profile has not changed: Enbridge Gas’s awareness and understanding of the risks have expanded and now need to be mitigated.
- c) Please see the cost summary in Table 1. Based on the current risk reduction enhancements and planned inspection schedule, Enbridge Gas expects costs to remain higher than historic levels.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 2, p. 51

Question(s):

At the above reference, it is stated when discussing Engineering and STO costs increases for the 2024 Test Year versus the 2023 Bridge Year that:

The \$4.5 million increase in salaries & wages is driven by merit and FTE increases to support the maximum operating pressure (MOP) verification Program.(Footnote 14) The program's scope will be expanded to include the former Union Gas pipelines with the goal of demonstrating and understanding pipeline operating stresses in order to inform the Integrity program and facilitate the assessment of the Company's overall risk profile for higher stress pipeline assets.

Footnote 14 states as follows:

The MOP verification program supports an industry best practice that ensures pipeline operating limits are verified through assessments. This best practice was developed as a result of severe industry incidents and has been implemented to ensure asset records are traceable, verifiable, complete and that operating limits of pipelines are understood by the operators.

- a) Please state whether the MOP verification program is already in place in the former EGD business segment and is now being introduced in the former Union Gas business segment. If not, please explain.
- b) If this program was already in place in the former EGD business segment, please state when it was adopted by EGD.
- c) Please provide a breakdown of the \$4.5 million increase in salaries and wages related to the expansion of the MOP verification program in 2024. Please state the number of additional FTEs related to this program and why existing staff were not able to undertake the additional tasks.

Response:

- a) A MOP verification program had been established at EGD but was paused in 2020 in order to prioritize the integration of technical content as part of the amalgamation of EGD and Union.
- b) EGD established a formal MOP Verification Program in 2012.
- c) Of the \$4.5 million increase in salaries & wages, \$4.2 million relates to merit increases for Engineering & STO, and \$0.3 million is for 2 FTEs in MOP verification. Existing roles cannot take on this work as they are fully allocated to other design and support functions. The MOP Verification Program will now need to be fully re-established and resourced post completion of the prioritized content integration program.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 2, p. 51

Question(s):

At the above reference, it is stated when discussing Central Functions (CF) that:

Both EGD and Union Gas historically received corporate cost allocations from their respective corporate parents. In 2018, following the merger of Enbridge and Spectra, Enbridge established CFs that provide typical shared services to its affiliate companies and implemented an internally developed Central Functions Cost Allocation Methodology (CFCAM) to allocate the CF costs amongst the service recipients.

- a) Please state whether or not there are any differences between the current CFCAM and the historic methodologies used previously by EGD and Union that have had material impacts on how costs are allocated to the regulated entities currently, as compared to how they were allocated prior to the merger.
- b) If there were any material impacts, please identify the specific impacts and provide their magnitude.

Response:

- a) Yes, there are differences between the current CFCAM and the historic methodologies that EGD's and Union's corporate parents used to allocate corporate costs. Please see Exhibit 4, Tab 4, Schedule 3, paragraph 46 for a description of the change in methodologies.
- b) Enbridge Gas is not able to quantify the impacts of switching from the previous corporate cost allocation methodologies to the CFCAM. The datasets, grouping and allocation of costs between the two legacy company methodologies are significantly different from the CFCAM. It would therefore not be possible to quantify the differences with precision or to perform a detailed comparative analysis. The shifting of costs from departmental O&M costs and corporate allocations to CFCAM costs

has not materially impacted net Utility O&M, as provided at Figure 1 of Exhibit 4, Tab 4, Schedule 3.

Please see response at Exhibit I.1.9-EP-2, Attachment 1, which illustrates that the shift to Central Functions and CFCAM did not change costs materially compared to the sum of corporate allocations and in-house costs prior to the establishment of the Central Functions in 2018.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 2, p. 52 and Exhibit 1, Tab 9, Schedule 1, p. 21

Question(s):

At the first reference above, it is stated when discussing Central Functions (CF) that:

Beyond 2021 there are a few key factors impacting CF costs. First, TIS costs increase as a result of technology industry shifts to an 'as a service' model driving costs from capital to O&M. Technology modernization has resulted in a shift from capital intensive traditional on-site physical data centres to O&M intensive infrastructure and software 'as a service' models, leading to higher O&M related to the implementation and sustainment of solutions in an 'as a service' model.

At the second reference above, it is stated when discussing integration capital expenditures that:

Over the deferred rebasing term, Enbridge Gas expects to incur approximately \$252.2 million in capital expenditures related to integration efforts (Table 6). The revenue requirement to support these investments was not included in base rates, and as such was borne by the shareholder. The largest capital expenditures were in pillar technologies: one Customer Information System (CIS), one Asset and Work Management (AWS) system and buildings to effectively align areas with geographic proximity supporting field operations.

Please reconcile the statement in the second quote that over the deferred rebasing term "The largest capital expenditures were in pillar technologies: one Customer Information System (CIS), one Asset and Work Management (AWS) system and buildings to effectively align areas with geographic proximity supporting field operations" with the statement in the first quote that "Technology modernization has resulted in a shift from capital intensive traditional on-site physical data centres to O&M intensive infrastructure and software 'as a service' models, leading to higher O&M related to the implementation and sustainment of solutions in an 'as a service' model."

Response:

The software licenses for Customer Information Systems (CIS) and Asset and Work Management (AWS) Systems were previously acquired and owned by Enbridge Gas. The existing licenses were, and still are capitalizable, under US GAAP and in accordance with the Enbridge Enterprise Capitalization Policy provided at Exhibit 2, Tab 4, Schedule 1, Attachment 1. The implementation costs associated with the integration of Union data and processes into these EGD systems was achieved through the existing licenses, and therefore capitalized as well. This software has not migrated to an “As a Service” solution as of yet.

For ongoing sustainment of the CIS and AWS Applications, Enbridge Gas is now hosting the applications through an “As a Service” hosting provider. The fees for this hosting service are expensed as O&M, which is a shift from the capital intensive on-site physical data centres to the ‘as a service’ model. This has resulted in greater technology reliability and security improvements. The security of all Enbridge Gas data, including protection of customer data, is critical in the current environment where cyber warfare is on the rise. Through such an arrangement, technology patches and enhancements are more readily performed given the solution is provided to multiple clients, and there are no incremental costs to the Company as it is included in the hosting fees.

Please see Exhibit 2, Tab 6, Schedule 2, page 246 for additional information on infrastructure as a service.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 2, p. 54

Question(s):

Table 9 at the above reference provides Enbridge Gas's business unit benefits costs (BU Benefits). This shows a drop in these costs from \$143.3 million in 2021 to \$87.0 in the 2024 Test Year.

In explaining the differences in BU Benefits in the 2018 to 2021 period, it is stated that:

Contributing to the decline in 2021 is the change in identification of BU and CF benefits from improvements in CFCAM (please see paragraph 116). The BU benefits amount represents a lower portion of the overall benefits amount than estimated in prior years.

Please state whether this change resulted in any offsetting increases in CF costs to Enbridge Gas and if so, please provide these amounts for the 2021 to 2024 period. If not, please explain why not.

Response:

Please see Exhibit 4, Tab 4, Schedule 2, Table 9, updated March 8, 2023, where the \$87.0 million has been updated to reflect \$111.1 million in 2024 Test Year.

The above referenced change resulted in a \$26.4 million decrease for BU benefits and an offsetting \$26.4 million increase for CF benefits for 2021.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 2, p. 55

Question(s):

At the above reference, it is stated that:

In 2022 Estimate, BU benefit costs are forecast to decline by \$39.6 million as compared to 2021. Pension and OPEB are the primary driver of the year-over-year decline due to a \$26 million reduction from Mercer's actuarial valuation.

Please provide an explanation for the above-referenced \$26 million reduction.

Response:

The decline is primarily due to pension because of higher expected return on assets, lower current service costs and lower amortization costs.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 2, p. 56

Question(s):

Table 10 at the above reference provides EGI integration severance costs of \$41.5 million for 2019 and \$77.7 million for 2020.

Please provide the FTE reductions in 2019 and 2020 that resulted from the payment of these severance costs

Response:

FTE reduction in 2019 was 192 and 2020 was 327.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Ref 1: Exhibit 4, Tab 4, Schedule 3, p.8

Ref 2: Exhibit 9, Tab 2, Schedule 1, Attachment 9.

Ref 3: January 27, 2023 Evidence Correction and Updates, Attachments 1

Question(s):

Table 2 in Reference 1 provides total compensation expense broken down by salary & wages, as well as total benefits and incentive pay for 2024 and Table 1 in Reference 3 provides updated pension and Other Post-Employment Benefit (OPEBs) amounts.

- a) For the total benefits and incentive pay, please provide a breakdown of the amounts for pension and OPEBs for 2024.
- b) For the period from the last rebasing to 2024 for EGD, Union Gas and Enbridge Gas, as applicable, please provide the following annual pension as well as annual OPEB amounts:
 - i. included in rates
 - ii. actual/forecasted accrual amounts
 - iii. actual/forecasted cash contributions made
- c) For the annual pension and annual OPEB amounts included in rates and actual/forecasted accrual amounts provided in response to part b above, please provide an annual breakdown of the amounts included in OM&A versus the amounts included in capital.
- d) Please indicate if Enbridge Gas, EGD or Union Gas was eligible for a pension contribution holiday from the last rebasing to 2024. If yes, please provide further details.
- e) On page 2 of Reference 2, it states that from EGD RPP's inception to 2011, all DC contributions had been drawn from the DB provision's surplus. Starting in 2012, DC contributions were remitted from cash rather than the DB provision surplus. Please explain the rationale for the change in contribution treatment in 2012.
 - i. Please explain the implications to pension and OPEBs when DC contributions are drawn from the DB provision's surplus (e.g. impact to obligation)

- ii. For the actual/forecasted cash contributions made from last rebasing to 2024 as provided in response to part b(iii) above, please indicate the portion of cash contributions that could have been drawn from the DB provisions' surplus.

Response:

- a) With regard to the updated Pension and Other Post-Employment Benefit (OPEBs) amounts noted in Reference 3 above, the Pension and OPEB amount for 2024 within total benefits and incentive pay in the updated \$111 million in Exhibit 4, Tab 4, Schedule 3, Table 2 is a credit of \$1.3 million. The remaining \$0.3 million credit within 2024 forecast Pension and OPEB amounts is included in Central Functions Benefits.
- b)
 - i.-iii. Please see Attachment 1.
- c) Please note that EGD and Union prior to 2020 had overhead capitalization methodologies that differed in approach (details provided at Exhibit 2, Tab 4, Schedule 2). Prior to implementation of the Harmonized Overhead Capitalization Methodology for Enbridge Gas, EGD did not capitalize any portion of pension based benefits costs nor did it include any capitalized amounts in rates. Previous to 2018, Union had capitalized a portion of net pension benefit costs and included approximately \$6.6 million of capitalized amounts in rates.

With the implementation of the Harmonized Overhead Capitalization Methodology in 2020, Enbridge Gas began capitalizing a portion of the current service cost component of pension based benefit costs across both rate zones. This is provided at Exhibit 2, Tab 4, Schedule 2, page 17, Table 3. As described in that exhibit, Enbridge Gas capitalizes pension and benefit costs using a burdening approach with capitalization rates across 4 categories of costs including pension and benefits, therefore capitalization of the current service cost as a component of total benefits costs is not tracked separately. As a result, in order to respond to this request Enbridge Gas utilized assumptions on a best effort basis to support the request to provide estimates of the breakdown of capital and O&M amounts. Please see Attachment 1 for details of these estimates along with the assumptions used. Since the details in Attachment 1 are based on the assumptions as noted, this information should be utilized for illustrative purposes only.

- d) The following response was provided by Mercer:

Enbridge Gas, EGD or Union was eligible for a pension contribution holiday from the last rebasing to 2024. Specifically:

- The BU Plan was eligible for a pension contribution holiday in 2020 and 2021; and
- The G3 Plan was eligible for a pension contribution holiday in 2018 and 2020.

In accordance with applicable pension legislation, the plan's actuary must demonstrate to the pension regulator each year that sufficient excess assets are available using prescribed filings. No such filings have been submitted in 2023, however it is expected that Enbridge will do so for the EI RPP, EGD RPP and pension choices. Eligibility for a pension contribution holiday in 2024 cannot be established until after January 1, 2024.

e) The following response was provided by Mercer:

Certain financial and statutory conditions must be met prior to using DB surplus to pay DC contributions. Specifically, the plan's actuary must demonstrate to the pension regulator each year that sufficient excess assets are available. Starting in 2012, the EGD RPP did not meet the financial and statutory conditions to pay DC contributions from the DB portion of the plan.

- i. A pension and OPEB plan's obligations are not affected when DC contributions are drawn from the DB pension provision's surplus.
- ii. If eligible to take a pension contribution holiday, Enbridge has elected to do so. Accordingly, none of the contributions made from the last rebasing, as provided at Exhibit I.4.4-STAFF-132 part b) iii. could have otherwise been drawn from DB plan surplus.

Notes:

- (1) Updated for Mercer December 2022 update
- (2) As of 2019 the 2018 EGD and 2013 Union amounts are embedded in rates, \$20.8 million and \$47.4 million respectively. The amount in rates excludes the Employee Pension Credit Cost established in 2018 as part of the Enbridge Harmonized Pension Plans
- (3) Represents Union capitalized amount in rates since 2013, EGD has not had capitalized amounts in rates
- (4) Represents estimated capitalization on only the Current Service Cost component of Net Benefit Cost annually since 2018 ASU implementation
- (5) EGD rate zone did not capitalize any pensions costs prior to 2020, beginning in 2020 with Overhead Capitalization Harmonization
EGI capitalized the current service cost component of penion costs applicable to both rate zones
- (6) In 2019, upon amalgamation, Union adopted the corporate basis for pension expense with the unamortized pre-2017 actuarial loss/past service costs reclassified to the APCDA.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Ref 1: Exhibit 4, Tab 4, Schedule 3, p.8

Ref 2: Exhibit 9, Tab 2, Schedule 1, pp.17-19

Ref 3: Exhibit 9, Tab 2, Schedule 1, Attachment 8 - Mercer Letter

Ref 4: Exhibit 4, Tab 4, Schedule 2, Attachment 1 - Actuarial Report

Ref 5: January 27, 2023 Evidence Correction and Updates, Attachment 1

Question(s):

Table 2 of Reference 1 provides total compensation expense broken down by salary & wages, and total benefits and incentive pay for 2024

In Reference 2, it states that the balance in the Accounting Policy Changes Deferral Account (APCDA) reflects the unamortized accumulated actuarial gains/losses and past service costs incurred by Union Gas. The amortization of this amount and the corresponding drawdown of APCDA over the deferred rebasing term is recognized as a component of accrual-based pension expenses which are included in O&M and recovered in rates. The amortized amount from 2017 to 2023 is \$56 million. The remaining balance in the APCDA is \$155.2 million.

Reference 3 provides the projected balance sheet and accumulated other comprehensive income (AOCI) on the "local" books" basis for the fiscal years ending 2021 to 2023. It states that "local" books is prepared from the perspective that the Legacy Spectra Plans continued as going concerns, without taking into account the February 27, 2017 merger with Enbridge. The purpose of these projections is to estimate the difference between the unamortized actual gain (or loss) as at December 31, 2023 determined on the local books basis and the corporate books basis.

- a) For the period from the last rebasing to 2024 for EGD, Union Gas and Enbridge Gas, as applicable, please provide the annual pension and annual OPEB actual/forecasted actuarial gains/losses.
- b) Please confirm that actuarial gains/losses are being amortized over the expected average remaining service life (i.e. EARSL) of the active employee and included in rates in 2024. If not confirmed, please explain.

- c) Regarding the unamortized accumulated actuarial gains and losses and past service costs incurred by Union Gas and recorded in the APCDA, please confirm that no amortization of the APCDA is reflected in the 2024 O&M and no further amortization of APCDA is expected to be included in O&M going forward. If not confirmed, please explain.
- i. In Reference 5, pension and OPEB costs were updated. Please explain whether the update impacts the balance in the APCDA and the amortized amount. If yes, please provide updated amounts.
 - ii. Please provide a breakdown of the \$56 million (or updated amount per part ci above) amortized amount and the remaining \$155.2 million (or updated amount per part c-i above) in the APCDA by the amount relating to unamortized actuarial gains/losses and the amount relating to past service costs.
 - iii. Please explain whether the amount amortized in the APCDA was amortized on the same basis as the actuarial gains/losses that was included in rates (i.e. EARSL).
 - iv. Please confirm that the difference in the projections shown in Appendix A and B of the Mercer letter in Reference 3 and that shown in the Actuarial Report in Reference 4 only pertains to the actuarial gains and losses in AOCI, where the Mercer letter quantifies the Union Gas actuarial gains and losses for the period pre-2017 and the Actuarial Report quantifies actuarial gains and losses for Enbridge Gas, excluding the portion relating to pre-2017 Union Gas. If not confirmed, please explain.
- d) Please discuss Enbridge Gas's views on excluding all actuarial gains and losses from revenue requirement (if material), and instead capturing those impacts in a deferral and variance account.

Response:

- a) Please see Attachment 1 for the continuity of actual/forecast actuarial (gains)/losses for EGD, Union and Enbridge Gas from 2013 through 2024 Test Year Forecast.
- b) Confirmed.
- c) Confirmed. No amortization of the APCDA is reflected in 2024 O&M and no further amortization of the APCDA is expected in O&M going forward. This assumes that Enbridge Gas receives approval to dispose of the residual balance in the APCDA as at December 31, 2023 as requested in Exhibit 9, Tab 2, Schedule 1.

- i. Yes, the update impacts the APCDA forecast balance as Mercer provided updated forecast information for APCDA amortization. The updated forecast of the APCDA balance as at December 31, 2023 is provided in Table 1.

Table 1
APCDA Balance as at December 31, 2023

<u>(\$ millions)</u>	<u>Amount/Balance</u>
December 31, 2021 Ending Balance	169.4
2022 Amortization – Actual	<u>(9.1)</u>
December 31, 2022 Ending Balance	160.3
2023 Amortization – Forecast	<u>(4.3)</u>
December 31, 2023 Ending Balance - Forecast	156.0

- ii. Please see Attachment 1 for the breakdown of the amortization of actuarial (gains)losses between 2019 and 2022 Actuals plus an updated forecast for 2023 based on the Mercer update. As noted in i. above the revised balance forecast at December 31, 2023 is \$156.0 million which is comprised entirely of actuarial (gains)losses for Pension (\$159.8 million loss) and OPEB (\$3.8 million gain).
- iii. Yes, the amount amortized in the APCDA was amortized on the same basis as actuarial gains/losses included in rates (i.e. EARSL).
- iv. Confirmed.
- d) Enbridge Gas does not feel that excluding the amortization of actuarial gains/losses from revenue requirement and recording in a deferral account is in the best interests of either ratepayers or Enbridge Gas. The amortization of actuarial gains/losses is a component of the annual accrual based net benefit cost which should not be segregated from all other components as this would cause a disconnect between net earnings on the income statement from a corporate accounting perspective and for utility purposes. The annual variation in gains/losses can be material which would carry over to the annual change in deferral balances. The amortization of gains/losses over the EARSL prescribed by US GAAP is a mechanism to smooth out the volatility of gains/losses and, therefore, continued inclusion in the accrual based pension cost is an appropriate mechanism for smoothing annual rate impacts.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Ref 1: Exhibit 4, Tab 4, Schedule 2, Attachment 1 – Actuarial Report

Ref 2: January 27, 2023 Evidence Correction and Updates, Attachment 3 – Updated Actuarial Report

Question(s):

The Actuarial Report for Enbridge Gas was provided in Reference 1 and updated in Reference 2. The Actuarial Report includes net periodic benefit costs and minimum cash requirements for Enbridge Gas as well as its affiliates.

- a) Please provide a reconciliation of the accrual expense and cash contributions provided in 4.4.3-Staff-132 and the updated Actuarial Report for 2022 to 2024.
- b) Page 6 of the Actuarial Report states “The EI RPP, EGD RPP, Pension Choices Plan, and Legacy Spectra Closed Plans are funded by contributions from the Company unless it elects to use a funding excess to meet annual contribution requirements.” Please explain what the funding excess is, and when Enbridge Gas would elect to use the funding excess.
- c) Page 6 of the Actuarial Report states “In 2022, Enbridge Inc. decided to merge all past service benefits from the Legacy Spectra Closed Plans into the EI RPP”. The amendment and related asset transfer are subject to regulatory approval and have not been reflected in the results of the report. Please explain what the expected implications would be if the amendment and asset transfer are approved. Please also include a discussion on any regulatory impacts.
- d) Please provide Enbridge Gas’s most recent actuarial valuation. Please explain whether Enbridge Gas anticipates an actuarial valuation report in 2023. If so, when will the report will be available.
- e) In the updated Actuarial Report in Reference 2, it states that Mercer has projected the results of the December 31, 2021/January 1, 2022 actuarial valuations of the plans for the financial reporting and funding purposes forward to each year ending 2023 through 2024. Please explain how the recent changes in general economic conditions have impacted the actuarial valuation and resulting pension and OPEB costs.

Response:

a) As provided at Exhibit.I.4.4.-STAFF-132, amounts for 2023 and 2024 forecasts reflect the updated Mercer Actuarial Report amounts. The reconciliations between Exhibit 4, Tab 4, Schedule 2, Attachment 1 originally filed and the updated Mercer Actuarial Report for 2022 to 2024 are provided at Tables 1, 2 and 3.

Table 1
2024 Pension and OPEB Projections

Line No.	Particulars (\$ millions)	Accrual Expense/(Credit)	Cash Contributions

Table 3
2022 Pension and OPEB Projections (excluding ACPDA)

Line No.	Particulars (\$ millions)	Accrual Expense/(Credit)	Cash Contributions
1	Prepared in May 2022, primarily based on economic environment as at April 30, 2022 (1)	(10.9)	46.9
2	Prepared in January 2023, primarily based on economic environment as at November 30, 2022 (2)	(10.8)	45.0
Notes			
(1)	EB 2022-0200 Exhibit 4, Schedule 4, Tab 2, Attachment 1 Pages 1 to 89 Updated March 8, 2023		
(2)	EB 2022-0200 Exhibit 4, Schedule 4, Tab 2, Attachment 1 Pages 90 to 102 Updated March 8, 2023		

Explanations for the changes noted above for 2023 and 2024 are reflected in part e) below.

- b) Funding excess is the market value of pension plan assets in excess of the actuarial value of the liabilities, if any. Funding excess is determined by the plan's actuary through an actuarial valuation and in accordance with rules established under applicable pension legislation.

To the extent it is permissible under applicable pension legislation, Enbridge Gas would utilize funding excess to offset annual defined benefit and defined contribution service costs.

c) The following response was provided by Mercer:

If approved, the amendment and related asset transfer should simplify plan administration of Enbridge Inc's pension plans and improve member experience. All assets and the existing obligations that members have accrued in the Legacy Spectra Closed Plans will be transferred, without change, to the EI RPP. Going forward Enbridge Inc. will administer one aggregated plan (EI RPP), instead of six different pension plans independently. This will have a very limited impact, if any, on the regulatory treatment of the pension accrual costs.

d) The following response was provided by Mercer:

The forecasts included in Ref 2: *January 27, 2023 Evidence Correction and Updates, Attachment 3 – Updated Actuarial Report*, are the most recent. These actuarial reports are special purpose valuations prepared exclusively to support Enbridge Gas's rebasing application with the OEB and are not typically prepared on an annual basis.

e) The following response was provided by Mercer:

Of the changes in general economic conditions, the lower than expected investment returns on the plan assets between March 31, 2022 and December 31, 2022 had the most significant impact. Reflecting actual investment returns, which were less than initial forecasts, reduced the value of plans' assets and increases the pension cost.

The assumptions were also updated under more current economic conditions, primarily:

- increased discount rates, which improves the funded status of the pension and non-pension plans, but increases the pension and non-pension cost; and,
- decreased long-term expected return on plan assets, which increases the pension cost.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Ref 1: Exhibit 4, Tab 4, Schedule 2, Attachment 1– Actuarial Report

Ref 2: Exhibit 4, Tab 4, Schedule 2, p.53

Ref 3: Exhibit 1, Tab 8, Schedule 1, Attachment 10, p.94 – 2021 Enbridge Inc. Annual Report

Ref 4: OEB letter regarding 2023 Inflation Parameters, October 20, 2022

Ref 5: January 27, 2023 Evidence Correction and Updates, Attachment 3

Question(s):

Page 9 of the Actuarial Report states that the results of the December 31, 2021 / January 1, 2022 actuarial valuations of the plans have been projected forward for financial reporting purposes to each of the years ending 2022 through 2023. The purpose of these projections is to estimate the accounting costs for 2023 through 2024.

The projections are based on the economic environment as at April 30, 2022 and assumptions described in Appendix C.

Reference 2 states that for non-pension and OPEB benefit costs, inflation adjustments and impacts from changes in FTEs were layered onto the 2022 Estimate. Inflation was projected at 2.4% for 2023 and 2.2% for 2024.

In its letter issued on Oct 20, 2022 in Reference 4, the OEB calculated the 2023 inflation factor for electricity distributors to be 3.7%, and for electricity transmitters to be 3.8%.

- a) The OEB's prescribed inflation rates issued for the electricity sector are higher than Enbridge Gas's projected inflation rates for 2023 and 2024. Please explain the method used by Enbridge Gas for the projection and whether Enbridge Gas thinks that the projected inflation rates should be updated. If so, please provide the updated inflation rates. If not, please explain why these projected inflation rates should not be updated.
- b) Please provide a sensitivity analysis of a 0.5% change in assumptions similar to that shown in the 2021 Enbridge Inc. Annual Report.

- c) Page 18 of the Actuarial Report states “The projections and calculations of costs have been prepared in accordance with US accounting standards (US GAAP). They are based on methods, assumptions, and accounting policies selected by Management.” Please discuss the discretion management has in selecting methods, assumptions, and accounting policies and the impact it would have on pension and OPEB expenses.
- d) In Reference 5, it states the update in pension and OPEB results in an \$28.9 million increase in forecasted O&M. Please provide the main drivers for the increase in O&M.

Response:

- a) The projected inflation rate (2.4% for 2023 and 2.2% for 2024) is based on the forecast provided by various banks as of February 2022. For updated projected inflation rates, please see response at Exhibit I.3.2-SEC-154 part a). Enbridge Gas is not proposing to update its forecast to reflect the updated projected inflation rates. Enbridge Gas based its 2024 Test Year Forecast on the economic and financial assumptions provided in Exhibit 3, Tab 2, Schedule 4, in accordance with the time required to develop its forecast and evidence.
- b) The following response was provided by Mercer:

The following sensitivity analysis identifies the impact on the forecasted December 31, 2023 benefit obligation and 2024 net periodic benefit cost from Exhibit 4, Tab 4, Schedule 2, Attachment 1 pages 90 to 102, updated March 8, 2023, of a 0.50% decrease to the discount rate, expected return on assets, and salary scale. The impact of assumption changes are assumed to be independent of each other. The sensitivity analysis was prepared for the results in Exhibit 4, Tab 4, Schedule 2, Attachment 1 pages 90 to 102, updated March 8, 2023. Sensitivity analysis on the prior forecast was not prepared; however we do not expect the relative impacts of that analysis to materially differ.

Company's Share US GAAP ('000s)	December 31, 2023 Benefit Obligation	Impact of Change on Benefit Obligation
Baseline	\$2,029,455	n/a
Discount Rate minus 0.50%	\$2,156,331	\$126,876
Salary Scale minus 0.50%	\$2,004,634	(\$24,821)
Expected Return on Assets minus 0.50%	\$2,029,455	-

Company's Share US GAAP ('000s)	2024 Total Net Periodic Benefit Cost	Impact of Change on Net Periodic Benefit Cost
Baseline	(\$1,633)	n/a
Discount Rate minus 0.50%	\$4,315	\$5,948
Salary Scale minus 0.50%	(\$5,039)	(\$3,406)
Expected Return on Assets minus 0.50%	\$10,073	\$11,706

c) The following response was provided by Mercer:

The applicable accounting standard provides limited management discretion in selecting methods and accounting policies. This is because an objective of the accounting standard is to improve the understandability and comparability of amounts reported by employers with similar plans.

Accounting policies and methods are to be selected once by management, and then be applied consistently from year to year. For example, all entities must establish a policy for the recognition of gains and losses that reside in accumulated other comprehensive income. The applicable accounting standard provides a range of permitted options for this policy. Methods are generally prescribed and provide approaches to the valuation of plan obligations and plan assets.

The discount rate is selected by reference to market yields on high-quality corporate bonds as of the measurement date. This assumption, along with all other,

assumptions used to measure the plan obligations and plan costs must be the best estimate of a particular future event, be internally consistent, and be current as of the measurement date. Further, actuarial standards with respect to pension and benefits accounting require the assessment of reasonableness by the actuary of each material assumption selected by management.

In accordance with the accounting standard, Management applies methods and accounting policies consistently from year to year. Management has elected to use the 10% corridor approach for recognizing actuarial gains and losses in the net periodic benefit cost. This approach assists in stabilizing the net periodic benefit cost, as gains and losses are only amortized and recognized in the net periodic benefit cost when they exceed the prescribed threshold. Alternative permitted policy decisions for recognizing gains and losses would increase the volatility of the net period benefit cost; however, these alternatives are not explored by Management, as the gain and loss recognition policy has been established.

Assumptions are selected each year by Management to meet the criteria of the accounting standard. In accordance with actuarial standards, the actuary provides a rationale or assesses the reasonableness of each material assumption used. Once Management chooses the assumptions, any future experience different than assumed must ultimately be recognized in the net periodic benefit cost as either a gain or a loss. A 'sensitivity analysis' shows the degree to which results would be different if you substitute alternative assumptions had market conditions been different. Please see response at Exhibit I.4.4-STAFF-135 part b) for a sensitivity analysis of three key assumptions to the actuarial valuation.

d) The following response was provided by Mercer:

The main driver for the increase in O&M was investment returns on the plan assets lower than expected between March 31, 2022 and December 31, 2022 and decreased future expected return assumptions. This contributed more than 75% of the \$28.9M increase in cost.

The second largest contributing factor for the increase in O&M was the increase in the discount rate based on current market conditions as at December 31, 2022, which improved the funded status of the pension and non-pension plans, but increased the pension and non-pension cost. This contributed just less than 25% of the \$28.9M increase in cost.

There were other adjustments in some economic actuarial assumptions based on current market conditions which did not have a significant impact.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Ref 1: Exhibit 4, Tab 4, Schedule 2, Attachment 1– Actuarial Report

Ref 2: January 27, 2023 Evidence Correction and Updates, Attachment 1

Question(s):

In Reference 2, Enbridge Gas proposes to establish the Post-Retirement True-Up Variance Account (PTUVA) to record the difference between the revenue requirement impact of actual pension and OPEB costs and the revenue requirement impact of pension and OPEB costs included in rates. Please confirm that the revenue requirement impact of pension and OPEB costs will include the portion of costs in OM&A and the portion of costs in capital. If not confirmed, please explain.

Response:

Confirmed. The revenue requirement impact of pension and OPEB costs will include all pension and OPEB O&M costs, irrespective of whether they were capitalized or not.

Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, p. 4

Question(s):

At the above reference, it is stated that:

As integration activities reach completion, 2023 will see a reduction of approximately 115 FTEs dedicated to integration with the remaining 70 FTEs being eliminated in 2024.

Please state whether these FTEs will be eliminated from the total headcount of Enbridge Gas on a permanent basis or will be eliminated from the integration activities but reassigned to other projects.

Response:

The positions will be eliminated on a permanent basis.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, pp. 4-5

Question(s):

At the above reference, it is stated that:

Several of the key trends and drivers provided at Exhibit 4, Tab 4, Schedule 2, will require incremental FTE additions beginning in 2022, continuing into 2023 and sustained for 2024. While all business unit departments have FTE additions, Distribution Operations and Engineering and Storage & Transmission Operations account for most of the growth occurring between the 2021 actual FTEs of 3,013 (2,928 excluding integration FTEs noted in the preceding paragraph) and the 2024 Test Year FTEs of 3,470.

OEB staff also notes in this context that at the same reference, Enbridge Gas discusses the staff reduction programs that took place in the 2018 to 2020 period as a result of the restructuring and the VWO program.

- a) Please state whether at the time these staff reductions were made, Enbridge Gas was anticipating the need for the staff increases that are currently forecast for the 2022 to 2024 period.
- b) If Enbridge Gas was not anticipating these increases at that time, please explain why this was the case.
- c) If Enbridge Gas was anticipating these increases, please explain why it made the noted staff reductions when it was aware that additional staff would be needed beginning in 2022. In responding, please discuss whether Enbridge Gas assessed how the termination costs involved in the VWO program would compare to the costs of retaining the staff until 2022 when the increased staffing requirements were anticipated to begin. Please provide any analysis that was undertaken related to this matter, or if none was undertaken, please explain why this was the case.

Response:

a-c) COVID-19 had a substantial impact on the Company's operations as well as the economy at large. Due to a high level of uncertainty, public health restrictions, limited site and asset access, and labour shortages driven by worker and contractor illness, work had to be curtailed. At that time, it was unknown how long the pandemic would last, however, there was still an expectation that Enbridge Gas would get back to normal pre-COVID work volumes eventually. It would have been impossible to anticipate all the impacts the pandemic would have on the Company's operations and the economy. The incredible boom in construction and customer attachments post COVID-19 is impacting workload in 2023 and 2024. Introduction of new compliance requirements and advancements in integrity risk modelling, resulting in a greater number of inspections and remediation work to enhance safety and reliability is also impacting work volumes in the next two years.

With greater insight into the type of work facing the Company, the technical qualifications required would not have been satisfied with the FTEs eliminated through organizational restructuring and VWO. These FTEs were largely in management level positions that would not have had the appropriate skillset for the nature and type of the increased workload the Company is facing today.

Irrespective of the FTEs presented at Exhibit 4, Tab 4, Schedule 3, page 3, Table 1 for 2023 and 2024, Enbridge Gas has committed to embedded productivity that will have to, in part come from FTE forecast reductions and will require active management of labour resources throughout the next Incentive Rate-Setting Mechanism (IRM) term. Please see Exhibit 4, Tab 4, Schedule 3, paragraph 19.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, p. 8, Table 2

Question(s):

Note 3 at the bottom of the above referenced table states as follows:

Costs for employees that are part of CFs have been excluded from Enbridge Gas compensation amounts starting in 2018 following the Enbridge Spectra merger as costs are allocated through the Central Function Cost Allocation Methodology

Table 2 shows total compensation decreasing from \$541 million in 2017 to \$444 million in 2018, a drop of \$97 million.

Please state whether the allocation of these costs through the Central Function Cost Allocation Methodology beginning in 2018 resulted in any changes to these costs or was just a reclassification of them. If there were any changes, please state the amount of the changes.

Response:

The reduction in total compensation in 2018 was largely the result of centralization brought about by the Enbridge and Spectra merger. The compensation for groups that were centralized, such as HR, TIS, and Finance, are now part of the CF costs allocated to Enbridge Gas by the Central Functions Cost Allocation Methodology (CFCAM). The amount of the changes cannot be isolated within the CF costs allocated to Enbridge Gas because the costs of these teams, which include salaries and wages, are now allocated as part of larger service categories within CFCAM based on various cost drivers. Please see Exhibit 4, Tab 4, Schedule 3, paragraph 51 and Attachment 5 for more details.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, p. 19

Question(s):

At the above reference, it is stated that:

Enbridge implemented CFs beginning in 2018 and provides the associated services to affiliates, including Enbridge Gas, rather than the provision of those services by Enbridge Gas itself. Prior to the merger in 2017, these services were provided by utility-based employees and augmented by additional services provided by the respective corporate parent.

- a) Please provide the amount of any costs related to the switch over to the CF system in 2018 that were allocated to Enbridge Gas.
- b) Please state whether the switch to the CF system increased or decreased the costs allocated to Enbridge Gas.

Response:

- a) The switch over to Central Functions in 2018 was part of the transformational effort after the Enbridge-Spectra merger. Transformational costs were not allocated.
- b) The switch over to Central Functions increased the costs allocated to EGD and Union, and subsequently Enbridge Gas, in lieu of incurring those costs directly within EGD and Union. Before the switch, some of the Central Functions services were being provided in-house by EGD and Union. Please see response at Exhibit I.1.9-EP-2 part b) for a breakdown between allocations and in-house costs.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, p. 31

Question(s):

At the above reference, it is stated with respect to the Guidehouse Conclusion, Adjustments and Observations that:

The 2022 budget proposed adjustments, provided at Attachment 3, Table 6-3, were accepted by Enbridge Gas and manually reflected in the 2022 Estimate and 2024 Test Year, provided at Attachment 3, Table 9-1.

Please explain Enbridge Gas's statement that these adjustments were manually reflected in the 2022 Estimate and 2024 Test Year.

Response:

The referenced statement means that Enbridge Gas has accepted the Guidehouse proposed adjustments related to Aviation and Depreciation and has excluded these Central Function charges from Utility O&M costs.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, p. 32, Table 3

Question(s):

At the above reference, TIS costs are shown to increase from \$66 million in 2020 to \$139.7 million in 2024 and Benefits costs are shown to increase from \$26.6 million in 2020 to \$61.4 million in 2024.

- a) Please provide an itemized breakdown of the increase in TIS costs between 2020 and 2024. For any category, with average annual cost increases greater than 5 percent, please provide an explanation for the cost increases.
- b) Please provide an itemized breakdown of the increase in Benefits costs between 2020 and 2024.

Response:

- a) Increases between 2020 and 2024 are provided in Table 1 and explanations are below.

Table 1
2020-2024 TIS Cost Breakdown

Business Driver (\$ millions)		Total
As a Service (Cloud Computing)	Development/Implementation	14.1
	Infrastructure/Sustainment	12.0
New Business Capabilities		20.5
Sustainment Costs		6.3
On-Premise Infrastructure Improvements		3.3
Cyber Security		3.4
Shift of Employee Benefits		6.7
Efficiencies		(0.8)
Inflation		8.2
Net increase (2020 vs 2024)		73.7

As a Service (Cloud Computing)

The \$26.1 million increase in costs from 2020 to 2024 relates to the adoption of “As a Service” (AAS), which represents the implementation and sustainment of core Enbridge Enterprise and Enbridge Gas technology to cloud technology infrastructure. The migration to AAS has and will continue to be an evolution as solutions reach their end of life over the next 5-10 years. This Program includes the adoption of AAS for all of Enbridge’s core technology, as well as Enbridge Gas specific solutions such as the Customer Information System that is used to bill 3.8 million customers at Enbridge Gas. Please see Exhibit 1, Tab 9, Schedule 1, paragraph 15 for more information on the CIS integration.

The AAS business model shifts the ownership and risk of technology infrastructure from an Enbridge owned on-premise capital based model to an internet (or cloud) O&M based model. With the AAS model the supplier owns the technology and the customer purchases a subscription service that is provided over the internet (or cloud). The Company and its customers benefit from the avoided capital cost over the long term related to the investment in the implementation of complex on-premise solutions along with the need for upgrades, enhancements and patches, to one monthly service fee residing in O&M. Please see response at Exhibit I.4.4-SEC-176 part b) for further information on the benefits for AAS.

New Business Capabilities

The increase of \$20.5 million in new business capabilities represents the planning, data conversion and training costs related to all new system implementation and enhancements for Enbridge Gas. An example of this increase is the Contract Market Harmonization (CMH) project which is expected to go into service in 2026. Please see Exhibit 2, Tab 6, Schedule 2, page 248 for more information on the CMH project.

Sustainment Costs

Sustainment cost increases of \$6.3 million are required to sustain and maintain the new business capability solutions through incremental internal and external resources supporting these new technology business solutions. Please see Exhibit 2, Tab 6, Schedule 2, pages 234 to 251 for additional details on some of the projects being implemented to support Enbridge Gas in the safe, reliable delivery of natural gas.

On-Premise Infrastructure Improvements

In addition to the improvements in the technology shift to the AAS model, all on-premise technology requires maintenance and enhancement leading to an increase of \$ 3.3 million related to modernization of core on premise infrastructure technology.

Cyber Security

The \$3.4 million increase is related to the direct investment in cyber security requirements such as compliance with Bill C27 - Digital Charter Implementation Act 2022 and NIST - National institute of standards and technology cyber framework, which

is in addition to the inherent cyber security benefits resulting from the move to the 'as a service' model. Please see Exhibit 4, Tab 4, Schedule 3, paragraphs 78 to 80 for more details related to cyber security.

b) Please see Exhibit 4, Tab 4, Schedule 3, Table 3, updated March 8, 2023 where the \$61.4 million has been updated to \$66.1 million in the 2024 Test Year. Increases between 2020 and 2024 are provided in Table 2.

Table 2
2020-2024 Benefits Cost Breakdown

	(\$ millions)
Shift in BU/CF Benefits Split (Presentation) (1)	26.4
Stock Based Compensation (LTIP)	17.0
Pension Costs	(5.0)
STIP (Incentive Pay)	(3.0)
Inflation	4.1
Net increase	<u>39.5</u>

Question(s):

At the first reference, Finance costs are shown to increase from \$25 million in 2020 to \$36.7 million in 2024.

At the second reference, it is stated that:

Finance costs have increased as a result of inflation and benefits alignment in addition to the creation of the Finance Sustained Business Organization (SBO) and Finance Strategic (FSS) groups, partially offset by synergies related to restructuring and VWO. Utility consolidation synergies are provided at Exhibit 1, Tab 9, Schedule 1. SBO and FSS provide new services to Enbridge Gas and were created to explore and drive out new productivity initiatives to identify potential cost savings, cost avoidance and revenue generation for Enbridge and its affiliates, including Enbridge Gas. SBO supports collaboration and connections across the company to maximize improvements and delivers a capability building program focused on empowering individuals including Enbridge Gas employees with new mindsets and behaviours to drive innovation and unlock value for the organization (lean, agile, design thinking, etc.). FSS supports Enbridge Gas in enabling business process efficiencies and optimizations. This has included the deployment of 66 BOTs through Robotics Process Automation, eliminating 3,500+ productivity hours previously performed by employees and allowing for work redistribution to higher value activities.

- a) Please provide an itemized breakdown of the increase in finance costs between 2020 and 2024. As part of the itemized breakdown, please also indicate whether costs are “Directly Attributable Costs” or “Indirect Costs” or “Direct Charge Costs”.
- b) Please provide any cost/benefit assessments of SBO and FSS undertaken by Enbridge Gas.

- c) Please explain why SBO and FSS costs have been categorized as finance related rather than as human resources or technology-related costs.

Response:

- a) The breakdown of the increase in finance costs between 2020 and 2024 are included in Table 1.

Table 1
2020-2024 Finance Cost Breakdown

Service Area	Cost Type	\$ millions
Accounts Payable	Indirect (2020), Directly Attributable (2021 to 2022)	3.0
Management Reporting, Planning, and Budgeting	Indirect (2020), Directly Attributable (2021 to 2022)	1.0
Finance Transformation	Indirect (2020), Directly Attributable (2021 to 2022)	0.9
Audit Services	Directly Attributable (2020), Indirect (2021 to 2022)	1.9
Shift of Employee Benefits into Finance costs		3.1
Efficiencies		(1.3)
Inflation		3.1
Net increase		11.7

Since the implementation of Central Functions and CFCAM in 2018, further centralization and refinement to CFCAM have occurred, resulting in some variability year over year in CF allocations.

- b) A cost benefit assessment has not been completed for SBO and FSS by Enbridge Gas. As provided in response at Exhibit I.4.4-CME-35, SBO in particular has supported the implementation of BOTs through Robotics Process Automation which has generated in excess of 5,200 hours of productivity savings. Guidehouse also completed a cost benefit analysis of the Finance Central Function to satisfy the cost benefit prong (Prong 3) of the OEB's Three Prong Test and is provided at Exhibit 4, Tab 4, Schedule 3, Attachment 3. Finance costs passed the third prong of the Three Prong Test.
- c) These costs have been categorized as finance costs because organizationally, this is where the resources providing the service reside.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, p. 34

Question(s):

At the above reference, it is stated in relation to Enterprise Asset and Work Management (EAWM) that:

EAWM is a new enterprise function providing services to Enbridge Gas as of 2020. EAWM provides expertise in the development and implementation of work management capabilities.

- a) Please state whether EAWM is an entirely new function. If so, please explain how asset and work management was facilitated in the absence of the EAWM enterprise function.
- b) Please state whether EAWM has resulted in any cost reductions in other components of the OM&A.
- c) Please provide any cost/benefit assessments of EAWM undertaken by Enbridge Gas.

Response:

- a) EAWM is not an entirely new function. A portion of this function that relates to Enterprise Asset Management was performed at the corporate level and was not allocated out to Enbridge Gas until 2021. A portion of this function that relates to Enterprise Work Management was performed at the local business unit level. To facilitate enterprise-wide alignment, the EAWM team was formed to develop governance and continuously improve the Asset & Work Management disciplines within Enbridge Gas through monitoring the Company's assets and maximizing their useful lives while managing life cycle cost. It also ensures that Enterprise-wide applications are being used consistently across the organization to improve user experience and influence solution adoption so that the Company has better data to make informed decisions about its assets. The operational execution of these

disciplines continues to be performed within the individual Business Unit Asset & Work Management teams.

- b) OM&A cost reductions were not expected as a result of the introduction of the EAWM function as this is a strategic-level organization which was formed to mature the Asset & Work Management disciplines.
- c) The EAWM team organizational structure was set up to develop enterprise-wide governance and continuously improve the Asset & Work Management disciplines within Enbridge Gas. It also is required as part of the implementation of Enterprise-wide applications to provide access to data to better monitor the Company's asset health to make informed decisions on an asset's lifecycle. A cost/benefit assessment was not undertaken by Enbridge Gas for this specific Central Function team.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, p. 35

Question(s):

At the above reference, it is stated that:

Legal costs have increased as a result of inflation and benefits alignment in addition to the centralization of legal services within the CF groups with corresponding decreases in CF costs for various CFs, including Finance.

- a) Please provide an itemized breakdown of the increase in legal costs between 2020 and 2024. As part of the itemized breakdown, please also indicate whether costs are “Directly Attributable Costs” or “Indirect Costs” or “Direct Charge Costs”.
- b) Please state whether centralization of legal services has resulted in an increase in legal costs. If so, please provide reasons.

Response:

- a) The breakdown of the increase in legal costs between 2020 and 2024 are provided in Table 1.

Table 1
Changes in Legal Costs

<u>Line No.</u>	<u>Service Area</u>	<u>Cost Type</u>	<u>\$ millions</u>
1	Gas Utility Law – external legal fees	Direct Charge Costs	1.5
2	Ethics and Compliance	Indirect Costs	1.7
3	Shift of Employee Benefits into Legal costs	Indirect Costs	0.9
4	Efficiencies		-1.2
5	Inflation		1.4

- b) Since the implementation of Central Functions and CFCAM in 2018, further centralization and refinement to the CFCAM have occurred, resulting in some variability year-over-year in CF allocations. Since 2018, the centralization of external legal fees has resulted in an increase in direct charges related specifically to Enbridge Gas matters. Ethics and compliance costs have also increased as a result of increased corporate security required as a result of various security related events across the industry. These increases have been partially offset by cost allocation refinements and efficiencies from centralization.

Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, p. 35 - 36

Question(s):

At the above reference, it is stated that:

PAC costs have remained fairly consistent aside from increases due to inflation and benefits alignment and the Indigenous Lifecycle Engagement and the Brand Reputation programs. The Indigenous Lifecycle Engagement Program is a relatively new area of focus which seeks to build positive long-term relationships with Indigenous nations and groups, including those in Enbridge Gas's franchise area. The Brand Reputation program highlights the role Enbridge's assets, including those of Enbridge Gas, can play in reducing emissions over time in a cost effective and reliable manner.

- a) Please provide the forecasted 2024 costs associated with the Indigenous Lifecycle Engagement Program and the Brand Reputation program.
- b) Please provide any cost/benefit assessments of the Brand Reputation program undertaken by Enbridge Gas.

Response:

- a) Forecasted 2024 costs for the Indigenous Lifecycle Engagement Program is \$0.5 million and for the Brand Reputation Program is \$1.1 million.
- b) There was no formal cost/benefit assessment completed by Enbridge Gas. The PAC Analysis completed by Guidehouse, which includes the Brand Reputation Program, passed the three-prong test. Please see Exhibit 4, Tab 4, Schedule 3, Attachment 3, page 48.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 1

Question(s):

- a) Please provide a list of all compensation benchmarking reviews and similar studies that Mercer Canada Limited (Mercer) or other organizations have undertaken for Enbridge Gas and its predecessor companies that have been filed with the OEB and the case numbers under which they were filed.
- b) Please state whether or not the approaches used by Mercer in its study filed in this proceeding are consistent with those which were used in these prior studies and, if not, please identify the substantive changes and provide a brief explanation as to why they were made.

Response:

- a) Below is a list of OEB case numbers for the compensation benchmarking reviews and similar studies undertaken for Enbridge Gas and its predecessor companies:
 - i. EB-2011-0354, Exhibit D2, Tab 3, Schedule 1
 - ii. EB-2011-0210, Exhibit D1, Tab 3, Appendix A
 - iii. EB-2005-0520, Exhibit D1, Tab 3, Appendix B
 - iv. EB-2005-0520, Exhibit J21.14, Attachment 1
- b) The approach used by Mercer in its study filed for this proceeding was consistent with the approach Mercer used for the compensation portion of the 2011 review conducted for EGD's 2013 Cost of Service¹ and the approach used by Towers Perrin/Watson for the 2006 review prepared for Union's 2007 Rates².

The approach used by Mercer in its study filed for this proceeding was not consistent with the 2005 and 2011 studies conducted by Towers Perrin/Watson for Union's

¹ EB-2011-0354, Exhibit D2, Tab 3, Schedule 1.

² EB-2005-0520, Exhibit J21.14, Attachment 1.

2013 Cost of Service³ and 2007 Rates⁴. For all Mercer studies, formal job benchmarking was used whereby Enbridge Gas jobs were matched into Mercer survey jobs using brief job descriptions. Once matched, compensation data for each job could be compared and measured. The 2005 and 2011 Towers Perrin/Watson studies did not involve job benchmarking. These market trend studies provided commentary on base salary increase growth (past actual and forecast) and short-term incentive pay usage prevalence and target award size at Union versus the comparator market.

³ EB-2011-0210, Exhibit D1, Tab 3, Appendix A.

⁴ EB-2005-0520, Exhibit D1, Tab 3, Appendix B.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 1
Exhibit 4, Tab 4, Schedule 3, p. 3, Table 1

Question(s):

At the second reference above, Table 1 “Employees – Full Time Equivalents” provides in column c “Business Unit” employees which are described as “EGI employees that provide core services to the utility,” while column d is “Central Functions” employees, which are described as “EGI employees that provide shared services to the utility. Their costs have been excluded from EGI Compensation amounts starting in 2018 following the Enbridge-Spectra merger as costs are allocated through the Central Functions Cost Allocation Methodology.”

Please state how Mercer took into account the exclusion of the costs related to the Central Functions employees in undertaking its study.

Response:

The following response was provided by Mercer (Canada) Limited:

Mercer did not take into account any potential exclusion of the costs related to Central Functions employees. The purpose of our benchmarking review was to establish Enbridge Gas compensation competitiveness relative to benchmark jobs in the market, regardless of cost allocation.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 1, p. 2

Question(s):

At the above reference, it is stated that:

In conducting the compensation analysis, Mercer worked with Enbridge Gas to identify benchmark positions that represent a statistically reliable sample of Enbridge Gas's functions and levels. Specifically, the review includes 354 non-union positions representing 82% of the non-union population, and 31 union positions representing 75% of the union population.

Please discuss the reasons for the significant difference between the number of benchmark jobs used in the study between non-union and union positions including whether the percentages of the union and non-union populations represented in the Enbridge Gas study would be typical of what Mercer would expect for studies of this kind. If these percentages are not typical, please discuss any impacts this would have had on the study.

Response:

The following response was provided by Mercer (Canada) Limited:

The Mercer benchmarking review covers a significant number of benchmark positions that are representative of the Enbridge Gas's non-union and union. Specifically, it covered 354 non-union positions representing 82% of the non-union population, and 31 union positions representing 75% of the union population. These fit within the range of Mercer's professional standards and exceed industry guidance. The difference between the number of benchmark positions (354 versus 31) is simply due to the nature of the union positions where many employees can be matched to the same benchmark position as their roles and responsibilities are similar.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 1, p. 3

Question(s):

At the above reference, it is stated with respect to the Ontario Comparator Group for Non-Union positions that:

- This comparator group reflects talent markets in Ontario that Enbridge would source talent from, and lose talent to, as most corporate positions do not require industry experience.
 - The data is sourced from the 2021 Mercer Benchmark Database and comprises of large (>\$3 billion in revenue) private sector organizations, with significant Ontario presence. Only data for Ontario-based employees is considered from this robust sample of large, general industry companies
- a) Please state whether or not Mercer undertook any assessments as to the extent Enbridge Gas would source talent from, or lose talent to, organizations other than the referenced large private sector organizations with significant Ontario presence. If not, please explain why not, and if so please state the extent to which Enbridge Gas sources talent from, or loses talent to, organizations other than the chosen comparator group.
- b) Please state why only data for Ontario-based employees is considered from the chosen sample and if this would be a restriction Mercer would typically incorporate in undertaking this type of study.

Response:

The following responses were provided by Mercer (Canada) Limited:

- a) Mercer did not undertake any formal assessment on where Enbridge Gas would source talent from, or lose talent to, although Mercer did confirm with Enbridge Gas that the comparator groups are representative of the markets that Enbridge

competes with for talent. For clarity, Mercer's analysis uses two comparator groups: the Ontario Comparator Group and the Energy Comparator Group. The benchmarking approach follows standard practice considering three common criteria: geography, industry and size, and reflects the fact that Enbridge is an Alberta-headquartered energy company with a meaningful presence in Ontario.

- Geography – use of the Ontario Comparator Group and the 67% weighting placed on this data set provides a focus on Ontario which is reasonable considering Enbridge Gas is based in Ontario
 - Industry – use of the Energy Comparator Group provides valuable perspective for positions that require energy industry experience
 - Size – use of a minimum revenue criterion for both the Ontario Comparator Group and the Energy Comparator Group ensures the organizations included follow similar compensation practices to those used by Enbridge Gas
- b) The Ontario Comparator Group is intended to provide a “local” perspective on compensation levels provided by organizations that are representative of the Ontario market that Enbridge Gas would source talent from, and lose talent to, for non-union positions. For this reason, only Ontario-based incumbents are included in the analysis. As a reminder, the Ontario Comparator Group forms only part of the benchmarking assessment for the non-union population.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 1, p. 3

Question(s):

At the above reference, it is stated with respect to the Ontario Comparator Group for Non-Union positions that:

- Where there is insufficient market data from the ideal comparator group, the scope was expanded until there is sufficient data to report in the following order: (1) All Ontario Public and Private Sector (25 positions), (2) All Ontario (2 positions), and (3) National All Industry (3 positions).
 - Market data is not reported for 75 positions that are energy-specific (e.g. Pipeline Scheduling).
- a) With respect to the discussion above of there being insufficient data from the ideal comparator group and the expansion of the scope until there was sufficient data, please explain how it was determined that the amount of data was sufficient.
- b) Please state whether the non-reporting of market data for 75 positions would be typical for a study of this kind.

Response:

The following responses were provided by Mercer (Canada) Limited:

- a) To ensure robust information to support recommendations and protect data confidentiality, Mercer only reports market median (50th percentile) statistics where there is a minimum of four (4) data points reported.
- b) Market data was not reported for 75 positions for the Ontario Comparator Group due to the fact that these positions are energy-specific (e.g., Pipeline Scheduling) and could only be found in organizations included in the Energy Comparator Group. This is typical for a study of this kind. For reference, the Mercer analysis covers 82% of

the non-union population across functions and levels. This fits within the range of Mercer's professional standards and exceeds industry guidance.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 1, p. 3

Question(s):

At the above reference, it is stated with respect to the Energy Comparator Group for Non-Union positions that:

—This group reflects companies most similar in nature to Enbridge Gas, that have similar compensation considerations in terms of administering pay and maintaining internal equity for a workforce across multiple provinces. This data set provides valuable perspective for positions that require energy industry experience.

Please explain how the analysis considered whether (and the extent to which) the companies in the Energy Comparator Group made use of services provided by affiliates, as is the case with Enbridge Gas.

Response:

The following response was provided by Mercer (Canada) Limited:

Mercer's benchmarking review did not consider whether and the extent to which the companies in the Energy Comparator Group made use of services provided by affiliates is irrelevant. Our analysis compares the compensation provided by Enbridge Gas to benchmark jobs and whether the job resides in the parent or an affiliate organization does not matter for purposes of the analysis.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 1, p. 4

Question(s):

At the above reference, it is stated with respect to the Energy Comparator Group for Union positions that:

- This group captures the Ontario market and collective bargaining job rates.
- The data is sourced from 2021 collective agreements at energy organizations in Ontario with a unionized population.

Please explain why Mercer used only Ontario organizations for the assessment of Union Positions, while also using groups outside of Ontario for non-Union positions.

Response:

The following response was provided by Mercer (Canada) Limited:

The union positions benchmarked are jobs commonly found in union environments and talent is most likely to be sourced locally in Ontario. Since peer groups are typically established based on where an organization draws talent or loses talent to, Ontario is the ideal market refinement to be applied for the union analysis. For the non-union positions, market comparisons were made to a combination of large, private sector general industry organizations in Ontario (weighted at 67%) and large, national energy sector organizations (weighted at 33%). These weightings were selected to focus on the local Ontario market while reflecting the fact that Enbridge Gas competes for talent with other energy companies across Canada.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 1, p. 4

Question(s):

At the above reference, it is stated that:

For non-union positions, market comparisons are made to a blend of large, private sector general industry organizations in Ontario (67% weighting) and large, national energy sector organizations (33% weighting). The weightings were selected to recognize the local Ontario market where Enbridge Gas competes for talent for these roles while also considering the energy industry in which Enbridge Gas operates. The weightings are reversed for director level roles to reflect the fact that talent is sourced nationally and that energy sector experience is more important for these senior positions.

- a) Please provide additional discussion as to the reasoning for the reversing of the weighting for director level roles.
- b) Please discuss the impact of this reversal on the results of Mercer's study.
- c) Please state whether this reversal is something that Mercer has done in other similar studies or is specific to the current study.

Response:

The following response was provided by Mercer (Canada) Limited:

- a) As referenced in page 4 of Mercer's benchmarking review, for senior level roles, energy sector experience is more important and a requirement of the role, therefore it is common to recruit nationally to expand the pool of candidates. Therefore, Mercer placed more emphasis on the Energy Comparator Group instead of the Ontario Comparator Group for director level roles. For reference, some examples of Enbridge Gas's jobs that are recruited nationally and where energy sector

experience is highly valued and required include Engineering Director, Field Operations Director, Project Management Director, and Gas Supply Director.

- b) If the weighting on the director-level roles (67% Energy/33% Ontario) was reversed to be the same as the weighting on other management positions (33% Energy/67% Ontario), the overall impact on the management market results is: +1.0% on Base Salary and Target Total Cash, and +2% on Target Total Direct.
- c) Mercer has used a similar methodology for entities similar to Enbridge Gas, where the market for talent for director level roles is more energy-focused, unlike for positions below the director level. This approach appropriately reflects Enbridge Gas's location in Ontario while recognizing Enbridge, as an Alberta-headquartered company, sources director-level talent nationally.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 1, p. 4

Question(s):

At the above reference, it is stated that:

For single incumbent director positions, a premium of 10% was applied to the market data to reflect the broader scope of responsibility for these positions.

- a) Please provide further explanation as to why this adjustment was made and how a 10% premium was determined to be a reasonable adjustment.
- b) Please state whether this adjustment is something that Mercer has done in other similar studies or is specific to the current study.

Response:

The following responses were provided by Mercer (Canada) Limited:

- a) Benchmark survey descriptions are usually quite brief and hit the high points (distinguishing characteristics) of job content. They are designed to indicate major job functions and career level, but do not cover every single duty the incumbent might have. Therefore, it is rare that a survey benchmark completely matches a specific job. A good rule of thumb is that a job is a good match for the survey benchmark if it is at the correct career level and represents 80% of the functions of the survey benchmark. In cases where there is a slight difference in responsibility but not significant enough for the job to be matched to a different level, it is common to apply premiums (or discounts) to the market data to account for the slight difference in responsibilities. For this review, a premium of 10% was applied to the market data for single incumbent director positions to reflect the broader scope of responsibility for these positions because of Enbridge Gas's relative size to the comparator organizations. Some of these single incumbent director positions include: Commercial & Marketing Director, Project Management Director, Accounting Director, Audit Director, Human Resources Director, etc.

- b) It is standard practice for Mercer to apply a premium or discount to jobs that can be matched to survey benchmarks but have slightly different responsibilities.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 1, p. 5

Question(s):

At the above reference, it is stated that:

Overall, Enbridge Gas non-union positions are within the competitive range. Management positions are positioned more competitively than non-management, but are generally within the market competitive range.

OEB staff notes that the table provided at the same reference shows that the overall -1% Target Total Direct compensation for non-union positions breaks down to +9% for management and -5% for non-management.

- a) Please state whether Mercer would consider this breakdown typical for this type of study when compared to those which it has undertaken for other Canadian utilities.
- b) Please explain the rationale for management positions being compensated at higher levels than the market competitive range.

Response:

- a) The following response was provided by Mercer (Canada) Limited:

Mercer is not able to comment on how typical the difference is but can point out that a job is considered market competitive if it falls within +/-10% of the target market positioning which is typically the median or the 50th percentile. One of the reasons why a single position can be as much as 10% away from the median is because of experience and performance. It is standard practice for organizations to pay above/below median to recognize for different levels of experience and performance.

- b) The average level of experience of all management positions at Enbridge Gas is higher than the rest of the Enbridge organization. Enbridge Gas managers have an average of 18.6 years of experience and directors an average of 20.3 years. On

average, this is 6.0 years higher than their Enbridge peers at these levels. Consistent with the response provided by Mercer in part a), a higher level of experience contributes to the market positioning of management positions.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 2

Question(s):

- a) Please provide a list of all compensation benchmarking reviews and similar studies that Towers Watson Canada Inc. (WTW) has undertaken for Enbridge Gas and its predecessor companies that have been filed with the OEB and the case numbers under which they were filed.
- b) Please state whether or not the approaches used by WTW in its study filed in this proceeding are consistent with those which it used in these prior studies and, if not, please state what any such substantive changes would be and provide a brief explanation as to why they were made.

Response:

The following response was provided by WTW:

- a-b) We are aware that WTW provided information that was filed with the OEB for Union Gas, a predecessor company of Enbridge Gas. However, we are not sure whether any of the evidence or testimony provided by WTW consultants was in respect of a similar analysis. It is our understanding that this information was prepared in 2011 and 2012. Since WTW has a 7-year document retention policy, the information provided is no longer available to us and the consultants involved in the 2011 and 2012 analysis are no longer with the firm.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 2, p. 5

Question(s):

At the above reference, a list of the benefit programs included in the WTW competitive benchmarking review of the pension, savings and benefits programs offered to Enbridge Gas's unionized and non-unionized employees (WTW study) is provided.

Please state whether or not any of Enbridge Gas's programs of this kind were excluded and, if so, identify the programs and explain why they were excluded.

Response:

The following response was provided by WTW:

The WTW Benefits Data Source (BDS) which BenVal, WTW's proprietary benchmarking method, is based upon, is a database of participating organizations' broad-based programs. As a result, programs that cover a small subset of employees for e.g., Senior Management Pension Plan, are not maintained in the database and would therefore not be reflected in a BenVal analysis for Enbridge Gas nor any other clients for whom we prepare these studies. In addition, wellness programs are not systematically collected in the WTW BDS and, according to our methodology, would not be reflected in a BenVal analysis. Besides the Senior Management pension plan and the wellness program we are not aware of any other programs sponsored by Enbridge Gas that were excluded.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 2, p. 6

Question(s):

At the above reference, it is stated that:

BenVal establishes a controlled environment where differences in value among employer plans are exclusively a function of the differences in plan provisions. A BenVal analysis is not intended to compare actual benefit costs. Each organization's actual benefits costs are affected by its benefit program design, but also by other factors which are not captured in a BenVal analysis such as funding decisions, plan experience and demographics. Each plan is valued under the same actuarial valuation method using a consistent set of actuarial assumptions and employee population.

- a) Please further explain how Benval quantifies differences in value among employer plans as exclusively a function of the differences in plan provisions.
- b) Given that a Benval analysis is not intended to compare actual benefit costs, please state what the appropriate comparative perspective for assessing the results of this analysis would be.

Response:

The following response was provided by WTW:

- a) As indicated on page 6 of 18 of our report, BenVal, WTW's proprietary benchmarking method, determines values for an organization benefit program using a consistent set of actuarial methods and assumptions applied to a common employee population. As a result, the plan provisions are the only variable in the analysis.

- b) The BenVal value is appropriate for the purpose of our review, which is to provide an assessment of the relative market positioning of Enbridge Gas's pension, benefits and savings programs against the selected peer group.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 2, p. 7

Question(s):

At the above reference, it is stated that:

When a plan offers the possibility to switch between a defined contribution pension plan and a defined benefit pension plan, employees are deemed to participate in the defined contribution pension plan if they are younger than age 46 as of the valuation date. If they are age 46 or older as of the valuation date, they are deemed to participate in the defined benefit pension plan. For the purpose of valuing the defined benefit plan, the Projected Unit Credit benefit is prorated over credited service after age 46. If the decision made at plan entry is irrevocable, employees who join the plan prior to age 36 are deemed to participate in the defined contribution pension plan while the others are deemed to participate in the defined benefit pension plan.

Please state whether or not the above assumptions are what would usually be used in studies of this kind or are specific to the WTW study. If they are specific to the WTW study, please further discuss the basis for these assumptions.

Response:

The following response was provided by WTW:

For plans that offer the possibility to participate between DC and DB plans, the assumption summarized above is a standard WTW BenVal, WTW's proprietary benchmarking method, assumption. Since DC and DB values can be different and employees may participate in both programs, recognizing both types of plans in the value is necessary. Based on our firm's experience the assumption is appropriate.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 2, pp. 8-9

Question(s):

At the above reference, the approaches to determining valuation for health and dental care, disability, death benefit and flexible benefit (other than pension) plans are outlined.

Please state whether or not the above approaches are what would usually be used in studies of this kind or are specific to the WTW study. If any are specific to the WTW study, please further discuss the basis for these assumptions.

Response:

The following response was provided by WTW:

The approaches described for health and dental care, disability, death benefit and flexible benefit (other than pension) outlined in the above reference are the ones used for standard BenVal, WTW's proprietary benchmarking method, reports. The standard WTW assumptions and methodology used in studies are reviewed annually by retirement and health and group benefits actuaries and are considered appropriate and reasonable for the purpose of determining benefit plan values used in these comparisons.

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 2, p. 9

Question(s):

At the above reference, it is stated that “Enbridge selected the peer group for the purposes of this review.”

Please state whether it is WTW’s normal practice when undertaking a study of this kind to have the entity being assessed select the peer group for the purposes of the study.

Response:

The following response was provided by WTW:

Yes, it is WTW’s normal practice when undertaking a study of this kind to have the entity being assessed select the peer group for the purposes of the study.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 2, p. 10

Question(s):

At the above reference, the 14 organizations in the peer group selected for this review are listed.

Please state why WTW believes that the Canadian Imperial Bank of Commerce, Labatt Brewing Company Limited and Sun Life Financial are appropriate comparators to Enbridge.

Response:

The following response was provided by WTW:

We believe that the three mentioned organizations satisfy Enbridge Gas's methodology for selecting the peer organizations as summarized on page 9 or 18 in our report. In WTW's experience, it is common for clients to include comparators that are outside of their industry.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 2, p. 15

Question(s):

At the above reference, it is stated that “The employer-provided value of Enbridge combined pension, savings and benefits programs is competitive and ranks them 6.3% above the peer group median.”

Please provide WTW’s views on the implications if the employer-provided value of the Enbridge Gas programs referenced above was at the peer group median, rather than 6.3% above it. Please include a discussion as to whether or not WTW believes this would be an appropriate level for Enbridge Gas to target going-forward and if not, why not.

Response:

The following response was provided by WTW:

BenVal, WTW’s proprietary benchmarking method, provides clients with a high-level understanding of the competitive positioning of their programs relative to their peer group (e.g., the value of their programs is in the 1st quartile, the value of their programs is close to median). In this instance, since Enbridge Gas’s positioning is at median of the selected peer group, using the peer group median instead of 6.3% above the peer group median would not change Enbridge Gas’s relative positioning.

We cannot specifically say what is appropriate for Enbridge Gas since each company establishes its own objectives around competitive positioning, however, based on our experience, targeting the median is a common approach.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 3, p. 17

Question(s):

At the above reference, it is stated that the Massachusetts Formula (or 3FF) and the Modified Massachusetts Formula have been accepted as cost allocation methodologies by utility regulatory commissions across the United States. It is further stated that 3FF has also been implemented by other utilities within Canada (footnote 12 notes the utilities to be ATCO, EPCOR, Fortis BC, Hydro One, AltaGas, SEMCO Energy and Pacific Northern Gas). It is also stated that in the case of Enbridge Gas a modified 3FF has been used.

- a) Please state whether the Canadian utilities listed by Enbridge Gas have implemented the 3FF approach or the modified-3FF approach.
- b) Please explain why the modified 3FF approach is appropriate for Enbridge Gas to use, relative to the other allocation options.

Response:

The following response was provided by Guidehouse Canada Ltd.:

- a) The table below summarizes the Canadian utilities that were identified to use a modified 3FF as a general allocator. Note, however, that 3FF modifications may differ from one utility to another.

Utility	Formula Used
AltaGas / Pacific Northern Gas	Modified 3FF
ATCO	Modified 3FF
EPCOR	Modified 3FF
FortisBC	Modified 3FF
SEMCO Energy	Modified 3FF

- b) 3FF, or multi-factor allocation formula, is found to be a generally accepted and commonly applied approach in the utilities industry to allocate costs for which a single allocation factor cannot easily be identified, or direct cost causation determined; as noted by Black and Veatch in EB-2021-0110, Exhibit E-4-8, Attachment 1, Hydro One Networks Report on Common Corporate Cost Allocation.

Enbridge Gas uses a modified 3FF as a cost driver to allocate costs for Cost Centres that do not have a more suitable cost driver available. The CFCAM methodology also uses other Cost Drivers (please see Exhibit 4, Tab 4, Schedule 3, Attachment 3, page 18, Table 4-1 for examples) in lieu of 3FF if available and representative of a more reasonable proxy of cost causation.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 3, p. 38, Table 9-2
Exhibit 4, Tab 4, Schedule 3, Attachment 3, p. 39, Table 9-3

Question(s):

At the first reference, in relation to the 2022 Forecast Comparative Analysis, it is shown that Enbridge Gas's normalized TIS costs are about 40% higher than the average comparative utility.

At the second reference, in relation to the 2024 Forecast Comparative Analysis, it is shown that Enbridge Gas's normalized TIS costs are about 46% higher than the average comparative utility.

- a) In both cases, please outline how many comparative utilities within the sample set analyzed had normalized TIS costs greater than Enbridge Gas.
- b) Please explain why Enbridge Gas's normalized TIS costs are significantly higher than the average comparative utility.

Response:

The following response was provided by Guidehouse Canada Ltd.:

- a) For the 2022 Forecast Comparative Analysis, 2 of 7 comparator utilities with available data had normalized TIS costs greater than Enbridge Gas. In the 2024 Forecast Comparative Analysis, 1 of 7 comparator utilities with available data had normalized TIS costs greater than Enbridge Gas.
- b) Please see response at Exhibit I.4.4-CME-39 part b).

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 3, p. 47

Question(s):

At the above reference it is stated that:

3FF is an appropriate Cost Driver for Corporate Secretarial, TIS, SCM Legal Services as well as Ethics, Compliance, Privacy & Security as these services benefit the entire organization.

Please explain why 3FF is an appropriate proxy for causation of legal services. What steps have been taken to ensure that Enbridge Gas has not been allocated legal costs in relation to its sister companies that may have more litigious operations?

Response:

The following response was provided by Guidehouse Canada Ltd.:

General response: Please see response at Exhibit I.4.4-STAFF-165 part b).

As found by Black and Veatch in EB-2021-0110, Exhibit E-4-8, Attachment 1, Hydro One Networks Report on Common Corporate Cost Allocation, 3FF is often applied to corporate services such as corporate affairs and general counsel.

As noted on the referenced page of our report, the Guidehouse examination found that Legal Central Function has several Service Categories which are delivered through several different Cost Centres. Some of these Cost Centres are clearly allocated by direct attribution as one would expect for legal services associated with litigation and other business-specific functions (such as general commercial and regulatory law) that can be tied to specific cases and specific sister companies.

Other examples of services, provided under the Legal Services, were found to relate to Corporate Secretarial, TIS, SCM Legal, Ethics, Compliance and Privacy and Security,

and are unrelated to litigation, and/or serve as a risk management function applied across all Enbridge companies making 3FF a reasonable cost driver.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Consumers Council of Canada (CCC)

Interrogatory

Reference:

Ex. 4/T4/p. 10

Question(s):

EGI has identified certain performance measures that not achieved the threshold amounts. These include telephone answering performance, call abandon rates and meter reading performance. When does EGI expect to meet or exceed the OEB targets? What are the additional costs of achieving the targets? Is it EG's proposal to have the ratepayers fund the costs of achieving these targets?

Response:

Enbridge Gas met both the Call Answering Service Level (CASL) and the Abandon Rate (AR) metrics in 2022. As set out in the Assurance of Voluntary Compliance (AVC),¹ Enbridge Gas agreed to aim for a target of 4% (or 3% excluding meters where access is not granted by customers) for the Meter Reading Performance Measurement (MRPM). MRPM result for 2022 was 4.1% (and 2.5% for meters where access was not granted by customers).

Enbridge Gas recognizes that the MRPM SQR continues to be a challenge as described in Exhibit 1, Tab 7, Schedule 1, page 10. On October 27, 2022, Enbridge Gas applied to the OEB for a one-year exemption for 2023, for the same modified performance measures to CASL, MRPM, and TRMA included in this Application. On December 23, 2022, Enbridge Gas was notified by the OEB that the application for a partial exemption from GDAR for 2023 will not be processed at this time, as this proposal to revise Enbridge Gas's SQRs is also a matter in this proceeding. The OEB has advised that it expects Enbridge Gas to continue to meet the commitments for CASL, AR, and MRPM that the Company made in the AVC.

The incremental cost to meet CASL and AR, and work towards meeting MRPM in 2022 is approximately \$6 million, which is reflected in 2022 O&M amount.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Consumers Council of Canada (CCC)

Interrogatory

Reference:

Ex. 4/T4/S2/p. 4

Question(s):

Utility O&M Costs are set out in Table 1. The evidence states, “In addition to the reductions tied to amalgamating EGD and Union, in 2020, COVID-19 resulted in a significant curtailment of work as provincial restrictions limited site and asset access. In addition, travel was limited due to reduced work volumes and provincial restrictions and labour shortages were driven by worker and contractor illness”. Please provide the specific impact COVID-19 had on O&M costs for the years 2020-2022. What are the specific COVID-19 impacts on the 2023 and 2024 O&M levels?

Response:

Table 1 provides the estimated net impact of COVID-19 on O&M costs. The values in the table represent the year-to-year increases/(decreases) in costs from 2020 to 2022. Other macro-economic conditions that are at least partially associated to COVID-19, such as inflation, labour shortages, contractor pricing pressure and supply chain disruptions, are not specifically quantifiable but were present from 2020 to 2022 and are expected to have persistent impacts on 2023 and 2024 O&M. Bad debt is an example where a variety of economic factors which are not individually quantifiable, including conditions associated with COVID-19, are driving the expense significantly higher in 2023 and 2024. Please see response at Exhibit I.4.4-STAFF-138 for further information on the impacts to work volumes in 2023 and 2024.

Table 1
Estimated Net Impact of COVID on O&M

Line No.	Particulars	2020 vs 2019	2021 vs 2020	2022 vs 2021
		(a)	(b)	(c)
1	Salaries & Wages	(4.8)	1.4	9.2
2	Contract Services	(13.5)	8.6	15.8
3	Fleet & Fuel	(2.3)	5.3	2.8
4	Sponsorships & Memberships	(3.9)	3.1	-
5	Other O&M	6.4	(5.0)	4.5
6	Total	(18.1)	13.4	32.3

The following provides high level drivers for the estimated year over year impact by cost category. All paragraph references are to Exhibit 4, Tab 4, Schedule 2.

2020 vs 2019

- Salaries & Wages – Lower overtime and FTE impacts (paragraph 63).
- Contract Services – Reduced locate and meter work (paragraph 64) and reduced IMP scope (paragraph 111).
- Fleet & Fuel – Lower fuel cost and usage from travel limitations (paragraph 65)
- Sponsorships & Memberships – Limited sponsorship opportunities (paragraph 29).
- Other O&M - \$10.3 million of COVID-19 direct costs for downtime and standby pay, emergency coverage, personal protective equipment, and janitorial services (paragraph 66), partially offset by an estimated reduction in employee related expenses such as travel.

2021 vs 2020

- Salaries & Wages – Higher overtime from the gradual return to pre-COVID-19 work volume and addressing backlog (paragraph 68).
- Contract Services – Higher locate and leak survey work (paragraph 69) and Integrity Management Program (paragraph 112) from the gradual return to pre-COVID-19 work volume.
- Fleet & Fuel – Vehicle maintenance, rental costs, and higher fuel costs (paragraph 70).
- Sponsorships & Memberships – Ramping up of sponsorship activities with the easing of COVID-19 restrictions (paragraph 30).
- Other O&M – Decline in COVID-19 direct costs (paragraph 71).

2022 vs 2021

- Salaries & Wages – Returning to pre-COVID-19 work volumes and addressing backlog (paragraphs 73).
- Contract Services – Returning to pre-COVID-19 work volumes and addressing backlog (paragraphs 74 and 113).
- Fleet & Fuel – Higher fuel costs and usage from returning to pre-COVID-19 work volumes (paragraph 75).
- Other O&M – Estimated increase in employee related expenses such as travel (paragraphs 31, 76, 97 and 113) offset by a decline in COVID-19 direct costs (paragraph 76).

Consumers Council of Canada (CCC)

Interrogatory

Reference:

Ex. 4/T4/S2/pp. 8-10 Table 2

Question(s):

Please explain how these Integration Synergies and Productivity Savings numbers were derived. Please include all assumptions. Please itemize all components. For example, the evidence points to higher e-billing adoption. In each year what are the savings associated with increased e-billing adoption? Please explain how the \$4.2 million of “net O&M embedded productivity” was derived.

Response:

Please see response at Exhibit I.1.9-CCC-25 for a list of the integration synergies and how the savings were derived.

Please see response at Exhibit I.1.9-SEC-90 for a list of the productivity savings, which include e-billing in Customer Care, and how productivity savings were derived.

Please see response at Exhibit I.4.4-CME-32 for an explanation of how embedded productivity was derived.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Consumers Council of Canada (CCC)

Interrogatory

Reference:

Ex. 4/T4/S2/p. 8

Question(s):

Please describe in detail EGI's policy with respect to e-billing. Are new customers automatically on e-billing or are customers given a choice of billing method? Have incentives been provided to customers to switch to e-billing? If so, how have these incentives been funded?

Response:

When a new or moving customer sets up their online profile with Enbridge Gas, they are automatically enrolled for e-Billing. Customers retain the option for a paper bill by contacting the Enbridge Gas contact centre.

When a new or moving customer sets up their profile with a contact centre agent, e-Billing is the default bill delivery method only when a valid email address has been provided by the customer. Existing customers who provide their email address as part of another interaction are not moved to e-Billing without specific consent. All customers retain the option to remain on, or go back to, paper billing at any time.

There are currently no e-Billing incentives provided to customers, however, there have been promotional campaigns in the past that were funded by the Customer Care O&M budget.

INTRODUCTION

Each year, People Leaders complete an annual compensation review of their non-union employees. Enbridge's compensation philosophy is to pay competitively for all employees, while ensuring that our most exceptional sustained performers receive exceptional rewards. At Enbridge, the annual compensation review is conducted in Workday. These guidelines outline the parameters of the various compensation programs.

These guidelines outline the three sections of the annual compensation review process and the actions required by People Leaders for:

- I. Merit Increases / Lump Sum Awards
- II. Short Term Incentive Plan (STIP)
- III. Long Term Incentive Plan (LTIP)

Note: People Leaders required to complete planning for eligible employees will access the annual compensation review task link through their Workday Inbox.

SECTION I: MERIT INCREASES / LUMP SUM AWARDS

OVERVIEW OF MERIT PLANNING

Each year a Salary Increase (Merit) budget is approved after consideration of a variety of factors including Human Resource Consulting Firms' salary projection trends, key economic indicators, and recent collective bargaining settlements. A different merit budget by defined criteria is a possible outcome based on this review process (i.e., by country, by grade, etc.). The Merit Program provides an opportunity for eligible employees to receive an annual increase to their base pay with a goal of advancing their position within their assigned pay range. Merit awards can be allocated as an increase to base pay, a one-time lump sum payment, or a combination of the two in alignment with program guidance.

ELIGIBILITY

The following are eligible for the Merit Program through the Annual Compensation Cycle:

- Regular, non-union employees with active payroll status on December 31st
- Employees on Leave of Absence (LOA)
 - Approved increases will be processed upon the employee's return to work
 - Excludes employees who have been on Long Term Disability for greater than 2 years

GUIDELINES FOR ALLOCATING MERIT

Enbridge is committed to a pay-for-performance philosophy where high performance and results are rewarded. In support of this philosophy, higher increases are to be allocated to high performers and individuals who are low in their range.

Merit increase recommendations in Workday are prepopulated using a Merit Matrix based on the approved merit budget, performance rating and range penetration. Lower range penetration with higher performance relative to peers generates higher increase recommendations. Below is an illustration of the merit matrix.

		Range Penetration Positioning		
		Zone 1 RP from 0% to 33%	Zone 2 RP from 33% to 67%	Zone 3 RP from 67% to 100%
Performance Rating	Exceptional	Highest Increases		
	High Performance			
	Successful Performance		Lowest Increases	
	Needs Improvement			
	Unsatisfactory			

Workday will prepopulate merit recommendations based on the midpoint of the applicable range on the Merit Matrix.

- For example, 2.0% – 3.0% recommended range will be prepopulated as 2.5%
- Each People Leader’s Merit planning budget is based on the sum of the prepopulated merit recommendations for their team. This planning budget is displayed within Workday.

During the review process, People Leaders may propose adjustments to the initial recommended increases and/or add Lump Sum Awards where appropriate, while staying within the budget displayed on their planning worksheet. If a People Leader increases an employee’s recommended merit increase, it will require decreasing the recommended merit increase(s) for other employee(s).

Factors that influence merit increase allocation within the approved range include:

- individual performance
- market competitiveness as determined by each employee’s position within their assigned pay range (i.e., range penetration)
- the employee’s pay position relative to their peers.

LUMP SUM AWARD

Lump Sum Awards are intended for use in situations where an employee is near or above the top of their pay range. It is suggested that employees who are above the top of the compensation pay range do not have a Merit Increase applied to their base pay. In these cases, People Leaders may choose to provide a Lump Sum Award for specific employees where appropriate (i.e., for high performance). Funding for Lump Sum Awards will be allocated within the Merit planning budget for employees who are above their assigned pay range, however, lump sums are not automatic and are therefore not prepopulated on the Workday planning worksheets. People Leaders must enter Lump Sum Awards if desired for eligible employees. It is not intended for all employees over the maximum of the range to be awarded a Lump Sum Award.

Funding for Lump Sum awards is included in the overall Merit budget visible on People Leader’s planning worksheets in Workday. Lump sum funding is only provided to employees whose base pay rate is higher than the maximum rate of their assigned pay range (i.e., range penetration > 100%).

SECTION II: SHORT TERM INCENTIVE PLAN (STIP)

OVERVIEW OF STIP

Enbridge's Short-Term Incentive Plan (STIP) is an annual cash-based incentive plan that creates a link between shared (or common) company-wide goals, your business unit goals, and the work you do each day.

STIP is focused on rewarding company-wide, business unit and individual performance over a one-year period. Each year, goals are set across the company and within each business unit to create alignment on business priorities that will help us achieve high levels of success.

ELIGIBILITY

The following are eligible for a STIP award through the Annual Compensation Cycle:

- Regular*, non-union employees with active service in the plan year (i.e., January 1 to December 31), active on December 31st
- Some union employees may be eligible based on the terms of their collective agreement

PLANNING STIP INDIVIDUAL MULTIPLIER

The default Individual STIP Multiplier in Workday will be prepopulated at 100%. People Leaders will be required to recommend an Individual STIP Multiplier for each direct report based on their performance rating. To support the planning process, People Leaders will be plan within broad, overlapping Individual STIP Multiplier ranges as follows:

5-POINT NARRATIVE RATING SCALE	GUIDELINE RANGE
Exceptional Performance	175% – 250%
High Performance	105% – 195%
Successful Performance	70% – 130%
Needs Improvement	35% – 75%
Unsatisfactory	No Flexibility

The STIP planning budget visible on the Workday planning worksheet is based on the Target STIP Multipliers*. There is no additional budget provided. Any decision to increase an employee's Individual Multiplier needs to be balanced against the impact of reducing the multiplier for another employee(s).

*Note: The Target Average Individual Multiplier is based on the final performance rating distribution for each CEO Direct Report's organization.

Payout

- STIP awards are paid in cash via direct payroll deposit
- STIP awards are pensionable based on the terms of the applicable pension plan

- Employees must be actively employed on the date of payout in order to receive payment, with the exception of those who voluntarily retire during the plan year who remain eligible for a pro-rated STIP award for their active service

SECTION III: LONG TERM INCENTIVE PLAN (LTIP)

OVERVIEW OF LTIP

Enbridge’s Long-Term Incentive Plans are designed to:

- Attract and retain top talent
- Align employee actions with our business strategy and the interest of shareholders
- Provide the opportunity for employees to share in the Company’s success and be rewarded for their contributions
- Reward and recognize future potential

ELIGIBILITY

The following are eligible for a LTIP award through the Annual Compensation Cycle:

- Regular, non-union employees, in grades E600 and up, active on December 31st
- Employees in grades E420, E500, and E510 are eligible for a Discretionary Restricted Share Unit (dRSU)

LTIP CALCULATION & DETAILS

- Grants are based on eligibility, annual base pay, compensation grade and target as of December 31st
- LTIP planning for eligible employees:
 - **Managers (E600) and above**
 - LTIP awards are displayed based on the target assigned to each role. No further planning is required in Workday.
 - **dRSU-eligible employees**
 - Recommendations are not prepopulated
 - People Leaders will be required to add nominations within distribution guidelines
 - A maximum dRSU budget will be held at the Director* level and is **not transferable** to other LTIP plans
- Grants will be executed following the Board of Directors’ approval

**Exceptions may apply*

PLANNING LTIP (MANAGER LEVEL AND ABOVE)

- Manager (E600) and above will have an LTIP grant prepopulated at target (100%)
- People Leaders will review the LTIP grants and submit at target (no additional planning required)

PLANNING DISCRETIONARY RSU (dRSU)

- All Regular Enbridge employees in roles assigned to grades E420, E500 and E510 are eligible for this program
- Awards are granted on a discretionary basis; they are variable and there is no guarantee that employees will receive an award
- People Leaders will nominate eligible employee(s) with recommended grant values equal to 6.5% of employee's base pay
- Considerations for proposing a dRSU include:
 - High Potential and High Performance over time
 - Critical skillset
 - Critical loss impact
 - Tight labour markets
 - Retention risk
- Organizations will be required to manage within the distribution guidelines by grade:

Grade	TARGET DISTRIBUTION	TARGET AWARD (% of BASE PAY)	SUGGESTED RANGE
E420	5%	6.5%	5.0% - 8.0%
E500	15%	6.5%	5.0% - 8.0%
E510	35%	6.5%	5.0% - 8.0%

COMPENSATION SUPPORT AND CONTACTS

All available point-in-time training materials, resources, and Comp Cycle FAQs for People Leaders can be accessed by typing the key phrase “Comp Cycle” into Mya.

For questions related to our compensation programs, the planning process and People Leader’s role please contact your HR Advisory Services Representative. You can find your HR Advisory Services Representative by asking Mya ‘Who is my HR Representative?’

For general questions on Workday navigation and process timelines, please contact Mya.

Human Resources

Call-Out Policy – Canada

Effective Date: January 2019

Revision Date: January 2019

Purpose

This policy establishes a Call-Out program for eligible Canadian employees to ensure that those employees who are called on to report to work outside of their regularly scheduled hours receive appropriate compensation for the related inconvenience.

Scope

- Canada. – All Business Units and Corporate Services in Canada.
- Note: Employees belonging to a Bargaining Unit (union) are governed by their respective collective bargaining agreement (“CBA”).

Eligibility

This policy applies to non-union employees, below the Manager level (below Grade E600).

Roles & Accountabilities

Employee

Employees are responsible to record the actual time spend as Call-Out. The time entry system will automatically apply the additional hours, if necessary to meet the minimum Call-Out requirement.

People Leaders

People Leaders are responsible for verifying and approving all Call-Out work hours reported by their employees through the appropriate time tracking system.

Guidelines

Participation in the Call-Out Program

An overtime eligible employee is automatically a participant in the Call-Out program, unless directed otherwise by their People Leader. An overtime exempt employee below manager level may, in limited circumstances, also participate in the Call-Out program.

Call-Out Definition

An employee triggers the Call-Out Pay provisions in this policy when they:

- a) Are a participant in the Call-Out program, and
- b) Are required to Report to Work.

An employee is required to Report to Work within the meaning of this policy when they are required to attend at or return to a workplace:

- a) After they have left a workplace upon completion of their scheduled hours, or;
- b) On a day in which they were not scheduled to work.

A call-out commences when an employee leaves their location to go directly to the assignment, and ends when the employee completes the assignment and returns to their location (by direct travel).

Call-Out Pay

An employee who has been Called-Out is entitled to Call-Out Pay.

- For overtime eligible employees, Call-Out Pay is the greater of the time worked at the applicable rate of pay (regular rate or overtime rate, depending on total hours worked in the current week) and the minimum Call-Out requirement, which is two (2) hours of time calculated at the employee's overtime rate of pay; regardless of how long they are required to attend at the workplace or how much work is performed.
- For overtime exempt employees approved to participate in the Call-Out program, Call-Out Pay is the greater of the time worked at the employee's regular rate of pay and the minimum Call-Out requirement, which is three (3) hours of time calculated at the employee's regular rate of pay; regardless of how long they are required to attend at the workplace or how much work is performed.

NOTE: If applicable employment legislation provides for a greater benefit, eligible employees will be provided the minimum compensation stated in the legislation.

Remote Resolution

An employee who is able to resolve a problem remotely, without returning to the work site, will be paid for the actual time spent on problem resolution at the applicable rate.

Questions

Direct questions about the Policy to Mya the HR Virtual Assistant or MyHR.

Human Resources

Overtime Policy - Canada

Effective Date: January 1, 2021

Revision Date: January 1, 2021

Purpose

This Policy sets forth the Company's commitment to provide overtime pay to eligible non-unionized employees as required by applicable law.

Scope

- **Canada** – All Canadian Business Units.
- **Note:** Employees belonging to a Bargaining Unit (union) are governed by their respective collective bargaining agreement ("CBA").

Eligibility

All non-union employees assigned to Grades E300 to E420, Field / Trades and Student grades, or those in job profiles designated as "non-exempt" by the Company are eligible for overtime pay under this policy.

Roles & Accountabilities

Employee

Employees are responsible for accurately reporting overtime hours through time entry.

People Leaders

People Leaders are responsible for advance authorization of overtime and for verifying and approving overtime hours reported by their direct reports.

Guidelines

- When necessary, eligible employees may be required to work overtime.
- When possible, advance notification of overtime will be provided.
- All overtime must be approved in advance (except in emergency situations) by a supervisor prior to being worked.
- Exceptions to these policy provisions must be approved by the Chief Human Resources Officer and must be in compliance with all applicable legislation.

Payment of Overtime

- Eligible employees will be paid overtime at 1.5 times their regular hourly rate of pay or in accordance with applicable local law.
- Except as otherwise stated in this policy, eligible employees will be eligible for overtime pay for time worked over 40 hours in a week or in accordance with applicable local law.
- Part-time employees will be eligible for overtime in accordance with this policy.
- Time related to bereavement leave, jury duty, paid time off/vacation, or statutory holiday will be treated as time worked for the purposes of this policy.
- Employees subject to a multi-week shift rotation or to another approved alternative work arrangement, including under the Alternative Work Arrangements (AWA) Policy, will be eligible for overtime for time worked in excess of their regularly scheduled hours.

Company Recognized Holidays

For time worked on a Company recognized statutory holiday, an eligible employee will receive holiday pay plus overtime pay of not less than the amount required by applicable law.

Time off in Lieu

“Comp time” or banking of overtime – the practice of allowing time off in lieu of paying overtime – is not allowed.

Consequences for Failure to Comply

Any non-exempt employee working overtime which has not been approved will be paid for this time; however, appropriate disciplinary action may be taken for not following Company procedures.

Human Resources

Shift Differential Policy - Canada

Effective Date: October 2021
Revision Date: October 29, 2021

Purpose

This policy establishes a program to provide shift premium pay for employees who are required to work 12-hour shifts.

Scope

- Canada – All Canadian Business Units
- Note: Employees belonging to a Bargaining Unit (union) are governed by their respective agreement.

Eligibility

Regular and Temporary, full-time and part-time who are mandated to work regularly scheduled 12-hour shifts supporting seven-day per week operations.

Roles & Accountabilities

Employee

Employees are responsible to record the shift differential earned through the appropriate time tracking system. All entries must be approved by their People Leader. Please refer to the Time Entry Guide for more details.

People Leaders

People Leaders are responsible for approving all shift differentials through the appropriate time tracking system.

Guidelines

Shift Premium Rates

- Day Shift Premium – A shift which ends after 12 pm (noon) will be considered eligible to receive the Day Shift Premium
- Night Shift Premium – A shift which ends after 12 am (midnight) will be considered eligible to receive the Night Shift Premium

Premium	Rate
Day Shift Premium	\$1.40 / Hour

Premium	Rate
Night Shift Premium	\$2.55 / Hour

Shift Premium Administration

- To qualify for shift premium, 12-hour shifts must be an on-going regular role requirement
- Shift premiums will be applied to actual hours worked and are not applicable to any periods of paid time off (i.e. Vacation, Scheduled Day Off, Statutory Holidays, etc.)
- This premium will not be added to an employee's base pay and as such will not impact any benefits affected by base pay including flexible benefits, savings plan, pension plan and incentive compensation.

Human Resources

Stand-By Policy - Canada

Effective Date: October 2021

Revision Date: April 14, 2022

Purpose

This policy establishes a Stand-By Pay program for eligible Canadian employees to ensure that those employees who are required to stand-by on call to provide up to 24-hour support, on an ongoing rotational basis, receive appropriate compensation for the related inconvenience.

Scope

- **Canada** – All Canadian Business Units.
- **Note:** Employees belonging to a Bargaining Unit (union) are governed by their respective agreement.

Eligibility

This policy applies to non-union employees, below the manager level (below Grade E600), in designated roles responsible for providing necessary support or for being available to take emergency calls outside of normal business hours.

Employees will be notified by their People Leader as to their designation and eligibility.

Roles & Accountabilities

Employee

Employees are responsible to record Stand-By time through the appropriate time tracking system. All entries must be approved by their People Leader. Please refer to the Time Entry Guide for more details.

People Leaders

People Leaders are responsible for approving all entries through the appropriate time tracking system.

Guidelines

Stand-By Requirements/Provisions

If designated as a participant in the Stand-By Pay program, an employee must be available and able to come to work at any time. While on stand-by they must:

- Carry a company cell phone/pager and have internet access (if normally required in their position) to respond to calls when requested;
- Ensure their pager, cell phone/blackberry and PC are charged and working;
- Be aware of dead zones in cellular coverage and ensure that they remain outside of such zones for ongoing contact;
- Remain within a reasonable distance of a work location/site where the necessary work is to be performed; and
- Adhere to all fitness to work policies, including the Alcohol and Drug Free Workplace Policy.

If a designated employee is sick and/or not able to be meet the obligations required by the Stand-By Pay program, their People Leader will designate a replacement for that employee until the employee returns to full duty. The replacement employee will be paid as per the Stand-By Pay program for the time they provide support.

An employee qualified in the Stand-By Pay program will be compensated for meeting these requirements regardless of whether or not a call is received, or support provided.

Stand-By Rates

Employees who are on Stand-By will be provided the following compensation:

Type	Rate
Weekdays	\$40 / day
Weekends	\$55 / day
Holidays*	\$100 / day

**Dates that Enbridge-Recognized Holidays are observed*

NOTE: If applicable employment legislation provides for a greater benefit, eligible employees will be provided the minimum compensation stated in the legislation.

Payment for time worked

In the event the employee is required to report to work while on Stand-By, eligibility for any additional compensation will be paid under the terms of the Call-Out or Overtime Policies.

Questions

Direct questions about the Policy to Mya the HR Virtual Assistant or MyHR.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Consumers Council of Canada (CCC)

Interrogatory

Reference:

Ex. 4/T4/S2

Question(s):

Please provide all wage and salary assumptions used to derive the 2024 revenue requirement. What are the wage and salary assumptions for each year 2024-2028?

Response:

The wage and salary assumptions used to derive the 2024 revenue requirement were based on forecast 2022 full-time equivalents (FTEs), FTE additions in 2023 and 2024 based on work requirements and assumptions for annual merit increases. For budget guidance used for merit, please see response at Exhibit I.1.2-SEC-78.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Consumers Council of Canada (CCC)

Interrogatory

Reference:

Ex. 4/T4/S2/p. 46

Question(s):

Engineering & Storage & Transmission Operations costs are increasingly significantly primarily due to increases in Contract Services. Please explain the reasons for these significant increases. Why is it preferable to use Contract Services?

Response:

Contract services consists of the following types of expense: outside services, professional & regulatory services, and repairs & maintenance. Significant increases in contract services can be attributed to the Integrity Management Program (IMP) due to increased costs to address risk modelling, and enhancements to standards leading to increased IMP inspections. Additional contingent workers are being leveraged for short term projects. Contract services is the preferred approach as IMP requires highly specialized services and equipment to complete assessment of Enbridge Gas's assets over their lifecycle.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Consumers Council of Canada (CCC)

Interrogatory

Reference:

Ex. 4/T4/S2/p. 47

Question(s):

The evidence states that Engineering & STO's costs vary from year to year based on the timing of proactive measures taken to maintain the integrity, safety and reliability of Enbridge Gas's assets. One of the key drivers of this group's historical cost variability is the integrity Management Program. Enbridge Gas has developed a risk model to assess the primary risks for pipeline assets in the distribution system in order to prioritize those approaching end-of-life which need to be replaced. Please provide that risk model.

Response:

Please see response at Exhibit I.2.6-SEC-127.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Consumers Council of Canada (CCC)

Interrogatory

Reference:

Ex. 4/T4/S2/p. 48

Question(s):

The Engineering & STO O&M increase from \$113 in 2018 to \$155.8 million in 2024. The evidence points to “significant O&M reductions”. What were these reductions in each year and why were they not sustainable?

Response:

Please see Exhibit 4, Tab 4, Schedule 2, Table 7, updated March 8, 2023. Engineering & STO O&M increases from \$113 million in 2018 to \$154.9 million in 2024.

Please see Exhibit 1, Tab 9, Schedule 1, Table 3, line 5 for integration savings achieved each year by the Engineering & STO department as well as descriptions of the savings in Exhibit 1, Tab 9, Schedule 1, page 13.

Along with integration savings, Engineering & STO has also committed to finding productivity savings embedded in the 2024 budget. While these integration and productivity savings are sustainable, the cost reductions were offset by increased costs to address work back logs, integrity program enhancements, risk modelling and enhancements to standards as well as rising inflation. Please see Exhibit 4, Tab 4, Schedule 2, pages 48 to 51 for more details on the cost increases each year.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Consumers Council of Canada (CCC)

Interrogatory

Reference:

Ex. 4/T4/S2/pp. 53-55

Question(s):

Please update the summary of Business Unit Benefits in light of the evidence update provided on January 27, 2023.

Response:

Please see Exhibit 4, Tab 4, Schedule 2, pages 53 to 55, updated March 8, 2023.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Consumers Council of Canada (CCC)

Interrogatory

Reference:

Ex. 4/T4/S3/p. 3

Question(s):

One of the expectations of a merger is an overall reduction in employees and a corresponding reduction in costs. In 2018 the total FTEs for Union and EGD were 3449. In 2024 EGI is projecting an FTE level of 3470. Please provide the following:

- a) A list of all positions eliminated as part of the merger;
- b) A list of all of the new positions created since the merger;
- c) The annual cost of the new positions created since the merger in 2024.

Response:

Enbridge Gas assumes that the reference to the merger in the interrogatory is the amalgamation of EGD and Union. Please see Exhibit 1, Tab 9, Schedule 1 for the benefits achieved with the amalgamation.

- a) Please see response at Exhibit I.1.3-CCC-21 part c).
- b) 272 new positions have been created since the amalgamation. Please see Attachment 1 for a listing of the positions.

The Company notes that as provided at Exhibit 4, Tab, 4, Schedule 3, paragraph 13 and 14, of these new positions, 23 incremental FTE additions are largely either funded by other sources, or ratepayer funded under previously adjudicated areas. Additionally, 10 incremental FTE are funded through the DSM Plan approved by the OEB in November 2022.

The Company notes that the number of employees fluctuates regularly based on internal movement, recruitment time and regular attrition consisting of voluntary and involuntary exits plus the addition of new positions. Therefore, the delta between the

positions eliminated in part a) and new positions in part b) will not align to the difference between 2018 and 2024 FTEs.

- c) The annual cost of the new positions in 2024 is \$33.5 million. This is based on the 2024 average O&M cost per FTE (salary and wages, including benefits) referenced in response at Exhibit I.4.4-EP-68 part d).

ENBRIDGE GAS INC.

Answer to Interrogatory from
Consumers Council of Canada (CCC)

Interrogatory

Reference:

Ex. 4/T4/S3/p. 8

Question(s):

Please file a table in the same format as “Appendix 2-K Employee Costs” of the Filing Requirements for Electricity Distributors for each year 2013-2024.

Response:

Please see response at Exhibit I.4.4-SEC-183.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Consumers Council of Canada (CCC)

Interrogatory

Reference:

Ex. 4/T4/S. 3/p. 8

Question(s):

Please recast Table 2 – Compensation to include a column setting out Central Function compensation costs for the years 2018-2024.

Response:

Please see response at Exhibit I.4.4-STAFF-139.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Consumers Council of Canada (CCC)

Interrogatory

Reference:

Ex. 4/T4/S3/p. 33

Question(s):

Total Central Function costs have increased by \$142 million since 2018. Has EGI explored whether or not it would be more cost effective to have these services provided through unaffiliated entities? If not, why not? Can EGI demonstrate that the provision of these services by Enbridge Inc. is more cost effective than alternative service providers?

Response:

No, generally speaking, Enbridge Gas has not explored alternative service providers for Central Functions. Although from time to time, Enbridge Gas may supplement Central Functions work with external consultants and service providers for specific tasks and scopes of work, as required. The OEB's *Affiliate Relationships Code for Gas Utilities* recognizes that gas utilities may share core corporate services, defined as business functions that provide shared strategic management and policy support to the corporate group of which the utility is a member relating to legal, finance, tax, treasury, pensions, risk management, audit services, corporate planning, human resources, health and safety, communications, investor relations, trustee, or public affairs. It is a common practice for large energy and utility organizations to have such shared core corporate services.

As provided at Exhibit 4, Tab 4, Schedule 3, page 29 and response at Exhibit I.4.4-CME-34, Enbridge Gas's dedicated resources perform internal reviews of the CFCAM and CF costs to ensure services are received and are required by the utility to ultimately conclude that CF costs are prudent.

As provided at Exhibit 4, Tab 4, Schedule 3, pages 26-28, Enbridge Gas benefits from economies of scale, access to subject matter expertise, strategic oversight and corporate governance, strategic planning, and sharing of best practices through the receipt of services from Central Functions. In addition, an independent review performed by Guidehouse, filed at Exhibit 4, Tab 4, Schedule 3, Attachment 3 assessed

CF costs using the OEB's three-prong test. The third prong requires a cost benefit analysis to be performed. Guidehouse performed a comparative analysis and found CF costs to be within range of various comparators selected. The combination of these factors indicates a balance between economy, efficiency and effectiveness.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Canadian Manufacturers & Exporters (CME)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 2, p. 9 of 62

Question(s):

At page 20, EGI stated: "At this time, opportunities for additional productivity savings have not been identified. However, productivity savings have been embedded to reflect committed savings which the Company will strive to manage... Gross O&M reductions of \$20.7 million (\$13.9 million net O&M) and \$28.5 million (\$18.1 million net O&M) have been included in the 2023 Bridge Year and 2024 Test Year, respectively."

- a) Please elaborate on how the total figures of \$20.7 and \$28.5 million in 2023 and 2024 were arrived at if there were currently no opportunities for additional productivity savings?

Response:

- a) In early 2022, while developing the forecast for 2023 and 2024, Enbridge Gas embedded a 1% to 2% productivity commitment within O&M costs in an attempt to mitigate rising inflation. The Company notes that inflation increased substantially since the forecast was developed and that while inflation rates have come down somewhat, costs remain elevated and there continues to be significant supply chain disruption in the marketplace. The expectation is that these productivity opportunities will be delivered through a form of cost reduction and/or growth initiative. These opportunities have not yet been identified as provided at Exhibit I.4.4-STAFF-113.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Canadian Manufacturers & Exporters (CME)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, p. 12 of 44

Question(s):

At page 12, EGI stated: "Designed to align with market median, STIP and LTIP targets are expressed as a percentage of each eligible employee's annual base pay."

- a) Of those employees that are eligible for STIP and LTIP awards, approximately what percentage meet targets and earn those benefits each year?
- b) Of those employees that are eligible for STIP and LTIP awards, approximately what percentage earn the maximum amount available?

Response:

- a) Approximately 95% of the employees that are eligible for STIP and LTIP awards meet targets and earn those benefits each year.
- b) Approximately 0% of employees that are eligible for STIP and LTIP awards earn the maximum amount available.

Answer to Interrogatory from
Canadian Manufacturers & Exporters (CME)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, p. 16 of 44

Question(s):

At page 16, EGI stated: "Enbridge Gas's dedicated resources continue to perform its internal review of the CFCAM and CF costs to ensure services continue to be received and are required by the utility to ultimately conclude that CF costs are prudent."

- a) To the extent that they are not already part of the record, please file any internal reviews or reports of CFCAM and CF costs that demonstrate or conclude that the costs relevant to this plan term are prudent.

Response:

- a) As provided at Exhibit 4, Tab 4, Schedule 3, page 29 "Enbridge Gas and Enbridge ultimately attest through the completion and signing of the Schedule 3 to the ISA - Central Services Cost Allocation Methodology Confirmation Notice (Confirmation Notice) that the cost allocations determined in accordance with the CFCAM are acceptable." As part of the process of obtaining approval and signatures for ISA Confirmation Notices, Enbridge Gas employees perform reviews of budgeted CFCAM and CF costs for a given year in order to:
1. Satisfy Enbridge Gas's due diligence requirement that the forecast CF cost allocations are appropriate to enable Enbridge Gas to execute the Schedule 3 Confirmation Notice with Enbridge;
 2. Provide confirmation that CF cost allocations are in compliance with the ARC and the Three-prong test.

Enbridge Gas reviewed and accepted the results of the Guidehouse Study and leveraged the work and recommendations provided in order to allow for the review of the 2021 and 2022 budgeted allocations, and ultimately the 2022 Estimate allocations that underpinned the Company's 2024 Test Year Forecast.

The results of the internal review are provided at Attachment 1. This review and conclusion within were the basis for informing Enbridge Gas's ISA signatories of the appropriateness and acceptability of the 2021 and 2022 services and associated cost allocations as contained in the relevant Confirmation Notices.

Memo

Date: November 2022

To: EGI Finance/Regulatory Accounting Files

From: Jason Vinagre (Manager Regulatory Accounting), Paul Baxter (Advisor Regulatory Accounting)

Re: 2021 Central Functions Corporate Cost Allocations – Annual Due Diligence Review

Background:

As per Schedule 2 of the Intercorporate Services Agreement (ISA), Central Services Cost Allocation Methodology (CCAM):

Centralized services groups (“**Central Services**”, “**Central Functions**” or “**CFs**”)¹ of Enbridge Inc. (**Enbridge or EI**) perform various services and functions for the benefit of Enbridge and many of its subsidiary legal entities (**Enterprise**). Costs of these Central Services are recorded in centralized cost pools and charged or allocated to individual entities or lines of business (**LOBs**) on a reasonable basis...with the intent to match cost causation as closely as possible.

Guiding Principles

In arriving at the methodology discussed...the following guiding principles were considered:

- i. Consistent in employing a standardized methodology across all BUs.
- ii. Costs will be allocated based on a reasonable estimate of the benefit derived by various operating entities.
- iii. Complies with regulatory requirements and joint venture agreements.
- iv. Meets taxation authority requirements.
- v. Simple to understand and administer.
- vi. Transparent in conveying the source of allocated costs, and the basis for allocating such costs.
- vii. Reasonable to business partners and affiliates receiving allocations.
- viii. Adaptable to changes in business while leveraging automation to limit manual intervention.

¹ Central Services, also called Central Functions, are: Finance, Technology Information Systems (TIS), Human Resources (HR), Real Estate and Workplace Services (REWS), Supply Chain Management (SCM), Legal, Corporate Development Office (CDO), Public Affairs and Communications (PAC), Executive, Safety & Reliability (S&R), Enterprise Asset and Work Management (EAWM) and Aviation. Also includes costs managed by Central Services including Insurance, Depreciation and Benefits.

- ix. Meets the requirements for cost recovery and compliance.

Per Section 5 of the ISA:

5 - Allocation Procedures:

5.1 - Cost allocations shall be made in accordance with the processes and procedures set out in the CCAM, which describes how EI will assign direct costs and calculate the allocable portion of pooled allocable costs of the Services to its Affiliates, including Enbridge Gas Inc. (EGI).

5.2 EI, in consultation with its Affiliates, including EGI, shall set the projected CCAM cost allocations² for the Services prior to December 31st of the year prior to the year to which the cost allocations apply, or as soon thereafter that such budgeting and cost allocation processes are concluded. As soon as practicable following such process, EI shall provide an annual CCAM report to each Affiliate, including EGI, that is either a Service Provider and/or a Service Recipient, setting out the final projected CCAM cost allocations for the year and the Services Charge to be paid by each Service Recipient (the "CCAM Report").

5.3 Upon request by EGI, the Parties shall work together to prepare and execute a confirmation notice substantially in the form set out in Schedule 3 to evidence their agreement with the projected CCAM cost allocations for any year during the Term.

OEB's Three-prong test:

EGI is regulated by the Ontario Energy Board (OEB), with its Affiliate Relationships Code for Gas Utilities setting standards intended to minimize the potential for a utility to cross-subsidize competitive or non-monopoly activities. While the ARC sets overall guidance for sharing of services and resources between affiliates, the OEB decision in EBRO 493/494 provided a more detailed framework against which the costs of shared services can be assessed. This framework is known as the Three-Prong test and is the basis of EGI's assessment.

Three-prong Test assesses:

1. Prudence of the services received;
2. Appropriateness of the allocation of costs using appropriate cost drivers; and
3. Benefits of the service weighed against its costs

Purpose of Annual Due Diligence Review:

EGI's annual due diligence review will:

1. Satisfy EGI's due diligence requirement that the forecast CF cost allocations are appropriate to enable EGI to execute the Schedule 3 Confirmation Notice with EI.
2. Provide confirmation that CF cost allocations are in compliance with the ARC and the Three-prong test.

EGI will perform an appropriate review of the forecast CCAM charges for the upcoming budget year to which the Schedule 3 will pertain. This review will determine:

1. Whether any material changes have been made to the services and level of service provided by each CF;
2. Were new CFs created during the year and are the related services provided to EGI?;
3. Would any changes in services and levels of service materially impact the CF Cost allocations?;
4. Have cost drivers used to allocate CF cost allocations changed and are the new drivers appropriate?;

² Referred to Central Functions costs/CF cost allocations for the remainder of the document.

5. Have there been any significant changes in the CCAM process that impact CF cost allocations to EGI?;
6. Are the forecast charges allocated appropriately and continue to meet the Three-prong test?;
7. Are the variances between prior year actuals and the forecast charges in line with the expectations based on above?

When the above review is completed and it has been determined that the forecast charges are appropriate and have satisfied the Three-prong test, EGI will provide the appropriate updates to Schedule 3 to be signed and executed.

Summary Conclusion – 2021 CF cost allocations:

Central Functions costs expensed in 2021 are reasonable and prudent. This is evidenced by:

1. The Three-prong test has been satisfied.
2. Cost variances are explained and are reasonable.

2021 Due Diligence Review:

New Methodology

In 2021 a refined CCAM was implemented and its implementation was expected to align with the implementation of Oracle Cloud in 2021. Due to an implementation delay, an excel-based model was built by Deloitte, a consultant, to calculate the 2021 CF cost allocations. The Cost Centres (CCs), the smallest breakdown of costs used in the model, were updated from 2020 to align with Oracle Cloud CCs, resulting in a lack of consistency between 2020 CCs and 2021 CCs. The methodologies used to allocate costs in 2020 and 2021 are also inconsistent, resulting in a lack of comparability between the two periods. EGI therefore did not use 2020 as the comparator for its variance analysis for its due diligence review, as has been done in past years.

Guidehouse Study of 2022 Budget and 2022 Forecast

In 2021, as part of EGI's 2024 rebasing application process, EGI hired a consultant, Guidehouse Canada Limited (Guidehouse), to conduct an independent review of EGI's 2022 Budget allocated CF costs. Guidehouse completed their fieldwork in November of 2021 and concluded that the CCAM and CF costs met the Three-prong Test. Guidehouse performed a subsequent review of EGI's 2022 Forecast and again concluded that the Forecast CCAM and CF costs met the Three-prong Test. The 2022 Guidehouse review was therefore used as a starting point for this review.

2021 review:

An internal review was performed to determine whether the CF cost allocations satisfied the Three-prong test. Specifically:

- Ensure that the allocation process was consistent to the one used for the 2022 Budget/Forecast. The process implemented with regard to 2021 actuals was the basis for 2022 Budget//Forecast. There were no significant changes from 2021 actuals through to the 2022 Budget/Forecast process.
- Inquiry of Service Providers and Service Recipients to confirm that the services were provided, required and consistent with what was identified in the 2022 Budget/Forecast review by Guidehouse.
- Review of the 2021 allocation model, including its logic, formulae, and integrity of data.
- Determine whether any amounts are not recoverable from ratepayers and an adjustment to utility results is required

Since it has been determined internally that the process and services are consistent between the 2021 actuals and the 2022 Budget/Forecast process, it is appropriate to rely on the work that

Guidehouse completed for 2022 Budget/Forecast and confirm in a similar manner that the Three-prong test is met for 2021.

Variance Analysis

The 2021 CF costs of \$290.6M were compared to the 2022 Forecast costs for reasonableness. **Because the level of service and the process is consistent with the 2022 Forecast year, it is reasonable to expect that the costs incurred in 2021 would be reasonably consistent to the 2022 Forecast amounts.** EGI compared the amounts year over year by CF to identify any areas that needed to be reviewed in more detail. If the year over year variances were not considered material (assessed as to whether the CF represented 10% or more of the total CF costs), then no further work was performed and the amounts were deemed reasonable and appropriate. Where a CF met or exceeded materiality as noted, explanations of the year over year variances were sought and disclosed. Please refer to Appendix B for the results of this analysis.

Adjustments

EGI leveraged the analysis performed by Guidehouse along with its own analysis performed during the GH study to determine 2021 adjustments. See Appendix B for reasons for the exceptions noted below.

Adjustment summary:

<u>CF</u>	<u>Adjustment</u>
Aviation	1.6
CDO	0.7
Finance	1.0
Depreciation	4.3
	\$ 7.6

Assessment of Utility Allocations

As noted in Appendix B, \$290.6M of CCAM costs were assessed for 2021. All but \$7.6M of the 2021 CF costs allocated were determined to be reasonable and appropriate and pass the Three-prong Test. However, the 2021 amounts ultimately allocated to the utility were adjusted downward by \$10.8M at the corporate level resulting in a 2021 utility expense of \$279.8M (\$290.6M - \$10.8M). Therefore, the \$7.6M in adjustments identified in this analysis were first applied against the corporate adjustment and no final adjustment was required to 2021 CF costs included in utility results.

Overall Conclusion

EGI reviewed the 2021 CF costs and concludes that CF costs were prudently incurred for services received, allocated appropriately, and provide reasonable cost/benefit for ratepayers. Although Prong 1 and Prong 2 indicate a total required adjustment of \$7.6M, no adjustment to Utility costs will be made because there is a \$10.8M corporate adjustment that will be first applied against the identified \$7.6M with the residual to be applied against all other functional areas. This results in a utility expense of \$279.8M that is prudently incurred for services received, allocated appropriately, and provide reasonable cost/benefit for ratepayers.

APPENDIX A – CCAM

There are three types of CF costs per the CCAM, of which two are allocable:

- a) Directly attributable costs – costs that are specifically attributable to a segment, sub-segment or LOB due to the direct provision of service and clear ability to demonstrate cost causality;
- b) Indirect costs – allocated costs for services provided to the entire enterprise, and not solely to one segment; and
- c) Direct charge costs – Recorded directly in the LOB to which they pertain. Hence, no allocation is required.

Approach	Definition	Characteristics	Process
Directly Attributable Costs	Centralized Functions costs captured in Cost Centres, which are specifically attributable to a Segment. The costs will be 100% allocated to that Segment and subsequently allocated within the Segment using a cost driver.	<ul style="list-style-type: none"> • Cost recipient decided by Centralized Functions • Cost sent to specific LOBs in that Segment 	<pre> graph LR CF[Centralized Function] --> SC[Service Category] SC --> SS[Specific Segment] SS --> LOB1[LOB 1] SS --> LOB2[LOB 2] SS --> LOB3[LOB 3] </pre>
Directly Attributable Costs	The CF costs are attributable to multiple Segments. Such cost will be allocated in two steps: first the cost is assigned to individual Segments based on a driver, such as a time estimate, and subsequently allocated to LOBs within the Segments using another prescribed cost driver.	<ul style="list-style-type: none"> • Cost recipients decided by Centralized Functions • Cost is first sent to specific Segments and then to LOBs in such Segment 	<pre> graph LR CF[Centralized Function] --> SC[Service Category] SC --> S1[Segment 1] SC --> S2[Segment 2] S1 --> LOB1_1[LOB 1] S1 --> LOB2_1[LOB 2] S2 --> LOB2_2[LOB 2] S2 --> LOB3_2[LOB 3] </pre>
Indirect Cost Allocation	Allocation of costs for services provided by Centralized Functions to the whole enterprise, and not specifically related to a single Segment.	<ul style="list-style-type: none"> • Costs are allocated to the entire enterprise using Cost Drivers 	<pre> graph LR CF[Centralized Function] --> SC[Service Category] SC --> LOB1[LOB 1] SC --> LOB2[LOB 2] SC --> LOB3[LOB 3] </pre>
Direct Charge Cost	Certain costs residing in Cost Centres mapped directly to operating LOBs will be excluded from the Allocable Cost Pool and left as a direct charge to the Segment they roll up to.	<ul style="list-style-type: none"> • Costs are directed to the appropriate Line of Business • Affects Legal, S&R, and Audit costs that are under "Direct Charge" 	<pre> graph TD LOB[Line of Business] --- CC[Cost Centre] </pre>

Appendix B – Summary of Review by CF

EGI 2021 Corporate Shared Services Review Summary												
ID (#)	Central Function	Prong 1				Prong 2				Prong 3		
		(A) 2021 Total CF Cost	(B) Percentage of Total	(C) Assessment	(D) Exception	Reason for Exception	(E) Assessment	(F) Exception	Reason for Exception	(G) 2022 Total CF Cost	(H)=(G)-(A)-(C)-(F) Variance 22 vs 21 Fav/(Unfav)	(I) Assessment
1	Finance	29.6	10.2%	Pass				Insufficient evidence of cost causality on total US Tax costs	35.1	6.5	Pass	The increase is due to the creation of the Finance Sustained Business Organization (SBO) and Finance Strategic Solutions (FSS) groups, partially offset by synergies related to restructuring and VWO. SBO and FSS provide new services to Enbridge Gas and were created to explore and drive out new productivity initiatives to identify potential cost savings, cost avoidance and revenue generation for Enbridge and its affiliates, including Enbridge Gas.
2	Human Resources (HR)	49.0	16.9%	Pass					52.1	3.1	Pass	The increase in 2022 is attributable to an expected increase in EGI FTEs, and the associated impact that has on HR's CFCAM cost drivers, along with the CFCAM benefits shift to functional areas.
3	Enterprise Asset and Work Management (EAWM)	0.6	0.2%	Pass					1.8	1.2	Pass	Increases due to inflation and benefits alignment.
4	Technology and Info Systems (TIS)	75.6	26.0%	Pass					108.3	32.7	Pass	Increase is driven by the technology industry shifts to cloud-based models driving costs from capital to O&M, specifically with costs related to the sustainment of the Customer Information System. Further driving the increase is an increase in cyber security costs to protect against the elevated cyber threat in the oil and gas industry.
5	Legal	11.1	3.8%	Pass					14.7	3.6	Pass	Increases due to inflation and benefits alignment.
6	Public Affairs and Communications (PAC)	4.3	1.5%	Pass					6.3	2.0	Pass	Increase due to new programs. The Indigenous Lifecycle Engagement program and the Brand Reputation program.
7	Safety & Reliability (S&R)	6.8	2.3%	Pass					7.2	0.4	Pass	Increase due to new services provided to Enbridge Gas for occupational health and safety testing and equipment.
8	Supply Chain Management (SCM)	8.3	2.9%	Pass					11.7	3.4	Pass	Increases due to inflation and benefits alignment.
9	Aviaton	1.6	0.6%	Pass (with exceptions)	(1.6)	Relates to usage of corporate jet for business travel outside of Ontario			0.0	0.0	Pass	Not material
10	Corporate Development Office (CDO)	2.4	0.8%	Pass				Insufficient evidence of cost causality on total Investment Review costs	2.4	0.7	Pass	Increases due to inflation and benefits alignment.
11	Executive	0.6	0.2%	Pass					1.1	0.5	Pass	Increases due to inflation and benefits alignment.
12	Benefits	59.0	20.3%	Pass					60.3	1.3	Pass	CF Benefits increased primarily due to higher LTIP based on a higher share price in early 2022 at the time of the forecast and higher health and other employee benefits costs. These increases were offset by a lower STIP forecast in 2022 compared to Enbridge Gas's performance in 2021, lower pension and OPEB costs based on actuarial valuations.
13	Depreciation	26.3	9.1%	Pass (with exceptions)	(4.3)	Relates to assets deemed not prudent for EGI			20.0	(2.0)	Pass	(\$5M) drop in depreciation on assets fully depreciated or retired in 2021; partially offset by \$3M increase in depreciation on new assets in 2022 or new in 2021 with full year of depreciation in 2022.
14	Insurance	15.4	5.3%	Pass					15.7	0.3	Pass	Foreign exchange rate differences causes the variance between 2022 and 2021. US\$12.2 is the amount for both years
15	Total	290.6	100.0%		(5.9)			(1.7)	336.7	53.7		
16	Corporate Adjustment	(10.8)										
17	Total after adjustment	279.8

Answer to Interrogatory from
Canadian Manufacturers & Exporters (CME)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, p. 34 of 44

Question(s):

At page 34, EGI stated: "SBO and FSS provide new services to Enbridge Gas and were created to explore and drive out new productivity initiatives to identify potential cost savings, cost avoidance and revenue generation for Enbridge and its affiliates, including Enbridge Gas."

- a) To the extent that they are not already part of the record, please identify any productivity initiatives, potential cost savings, cost avoidance or revenue generation that has been driven by either the SBO or FSS to date.

Response:

- a) SBO and FSS have focused on initiatives to develop skills, improve processes and reporting capabilities of the Enbridge Inc. organization. The deployment of additional BOTs through Robotics Process Automation as provided at Exhibit 4, Tab 4, Schedule 3, pages 34-36, has resulted in creating 5,200+ hours (increased from 3,500+ hours filed previously) of capacity to support redistribution to higher value activities. The SBO has provided seed funding to projects across the organization, including Enbridge Gas, to cover the cost of feasibility studies for potential opportunities relating to energy transition. As the facilitator of knowledge sharing and sharing of best practices, the SBO has supported the implementation of solutions to improve processes and drive efficiency at Enbridge Gas. In addition, the SBO administers a variety of skills development programs to improve employee skills and build capability across the enterprise, including Enbridge Gas.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Canadian Manufacturers & Exporters (CME)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 2

Question(s):

At page 34, WTW stated: "The peer group selected for this review is consistent with the peer group that Enbridge uses for internal company benchmarking reviews and reporting."

- a) Please provide the peer group used by Enbridge in its internal review. To the extent there are any differences in peer group, please explain why the included (or excluded) peers are appropriate to include (or exclude) in this benchmarking exercise.
- b) Please list all of the internal company benchmarking reviews and reports that would have a similar peer group that occurred since EB-2017-0306/0307 and provide a brief description of what aspects of EGI they would be reviewing.

Response:

- a) There are no differences in the peer group used by Enbridge Gas in its internal review.
- b) An internal company benchmarking review with WTW was completed in 2021 with the same peer group as that used for the study provided at Exhibit 4, Tab 4, Schedule 3, Attachment 2. The report reviewed the benefits programs provided to Enbridge Gas employees, including: pension, savings, health care, dental care, short-term disability, long-term disability, death benefits and flexible benefits.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Canadian Manufacturers & Exporters (CME)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 3, p. 22 of 59

Question(s):

At page 22, Guidehouse stated: "Guidehouse performed a detailed review of over 50% of assets generating depreciation."

- a) Please list the assets that Guidehouse did not perform a review on, and explain why it was unable or determined not to review the other 50% of assets generating depreciation.

Response:

The following response was provided by Guidehouse Canada Ltd.:

- a) Guidehouse notes the following correction to Exhibit 4, Tab 4, Schedule 3, Attachment 3, page 22 of the Guidehouse report. Guidehouse performed a detailed review of over 50% of the depreciation-related costs generated from assets, updated from "50% of assets generating depreciation".

Guidehouse reviewed depreciation costs associated with TIS and the corporate jet assets. Guidehouse did not review depreciation associated with real estate assets. Depreciation associated with the corporate jet did not pass the first prong of the Three Prong test and was eliminated from Enbridge Gas O&M budget. The table provides a summary of Guidehouse's review.

Asset Category	Depreciation (M)	Depreciation (%)	Depreciation Reviewed by Guidehouse (M)	Depreciation Reviewed by Guidehouse (% of total category)
TIS Software and Hardware	17.0	86.7	10.2	60.0
Real Estate	2.5	12.8	-	-
Corporate Jet	0.1	0.5	0.1	100.0
Total	19.6	100.0	10.3	53.0

Over 80% of Enbridge Gas depreciation costs are associated with TIS assets which include software, including cyber software, and various types of computer hardware including network, end user, cyber, and data center. Guidehouse reviewed approximately 60% of depreciation costs associated with TIS assets. Guidehouse's approach for this review was as follows:

- Guidehouse requested a list of all Enbridge Inc shared TIS assets
- TIS assets were categorized by year the assets were added to the TIS asset pool.
- Guidehouse ranked depreciation amount from each year by dollar value.
- To ensure representation, Guidehouse selected for review the highest dollar value ranking from each year, which in total represented approximately 60% of TIS depreciation costs allocated to Enbridge Gas. Guidehouse views this as an adequate sample size for the analytic purposes of this assessment as the scope of review was to determine reasonableness and effectiveness of the CFCAM methodology, not to perform an audit of costs and/or expense transactions such as depreciation.

The CFCAM was found to be effective in allocating enterprise assets depreciation costs based on the cost drivers utilized and functioned as intended. Assessing more marginal depreciation allocations would not yield greater certainty in this regard.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Canadian Manufacturers & Exporters (CME)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 3, p. 30 of 59

Question(s):

At page 30, Guidehouse stated: "Guidehouse did not perform comparative analysis for all CF allocations due to lack of publicly available information."

- a) Please list all CF allocations for which Guidehouse did not perform a comparative analysis.

Response:

The following response was provided by Guidehouse:

- a) Please see response at Exhibit I.4.4-EP-80.

Please see Exhibit 4, Tab 4, Schedule 3, Attachment 3, page 38, Table 9-2, Guidehouse conducted comparative analysis for functional areas that include Finance, Legal, HR, TIS, REWS and Insurance provision and did not for the remainder of CFs included in Table 9-1.

It is noted that, with the exception of Benefits, the CFs for which comparative analysis was conducted represent the largest cost items allocated at the CF level and include 67% and 68% of the proposed total allocated costs for 2022 budget and 2024 forecasts respectively.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Canadian Manufacturers & Exporters (CME)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 4, p. 20 of 48; Exhibit 4, Tab 4, Schedule 3, Attachment 3, page 32 and 38 of 59.

Question(s):

At page 20, Schedule 1, the agreement lists the services provided pursuant to the Intercorporate Services Agreement. For Technology and Information Systems, the agreement lists, inter alia, the following services being provided: core infrastructure and operations; enterprise business applications; enterprise architecture and data; cyber security and governance, and the office of the Chief Information Officer.

At page 32 of 59 of Attachment 3, TIS costs were normalized for comparison with the peer group based on "total operating cost".

At page 38, Guidehouse determined that EGI's normalized TIS cost per \$M in total operating cost was \$61,319. Guidehouse determined that the minimum was approximately \$26K, average was approximately \$44K and the maximum was approximately \$73K

- a) Please list (on an anonymized basis) all of the comparators normalized TIS costs;
- b) Please provide an explanation for why, on a normalized basis, EGI was significantly higher than the average TIS costs.

Response:

The following response was provided by Guidehouse:

- a) The table below summarizes normalized TIS costs, based on \$M of total operating cost for the relevant and anonymized utility comparators in CAD 2022 real dollars and CAD 2024 real dollars respectively.

Comparator Utility	Normalized TIS Cost (2022)	Normalized TIS Cost (2024)
1	Not available	Not available
2	\$41,453	\$41,453
3	\$47,233	\$47,233
4	Not available	Not available
5	Not available	Not available
6	\$28,605	\$36,446
7	\$32,783	\$31,240
8	\$29,815	\$29,815
9	\$73,643	\$69,610
10	\$58,654	\$65,577

- b) Guidehouse did not specifically compare discrete components of Enbridge Gas TIS costs relative to comparator utilities to rationalize where Enbridge Gas falls within the band.

Guidehouse understood from Enbridge Gas that allocated TIS costs were, in general, increasing because of significant investment this period in improvements to system reliability, enhancing business systems and to ensure system security as cyber security threats continue to grow. These increases are following a relatively consistent period from 2018 to 2021 resulting from inflation at that time combined with reductions from synergies and restructuring due to merger integration. It was also noted that industry shifts towards TIS 'as-a-service' models have also resulted in shifting costs, particularly shifts from capital intensive to OM&A in nature. These factors may be different in need or in timing relative to other utilities.

Given Enbridge Gas TIS costs fall within the range on a normalized basis relative to comparator utilities and were not assessed as the highest cost, Guidehouse did not determine it necessary to further test the incurrence of TIS costs. TIS costs are by nature lumpy and can vary from one period to another based on the investments being made to increase reliability, security, safety and overall efficiency of operations over the long term.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Energy Probe Research Foundation (EP)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 2, Plus Attachments. Page 4, Tables 1 and 2

Question(s):

- a) Please provide the Central Functions OM&A from 2015 -2024.
- b) Please explain the big increase in CF costs over the 10-year period.
- c) How much of the Integration and Productivity savings in 2024 relate to centralized functions and to other categories? Please list the main amounts.

Response:

- a) Please see response at Exhibit I.1.9-EP-2 part b).
- b) Please see Exhibit 4, Tab 4, Schedule 3, pages 34 to 40 for an explanation of the big increases in CF costs from 2018 to 2024.
- c) In 2024, \$15.8 million of integration and productivity savings relate to Central Functions. The main drivers of the savings were driven by organizational restructuring in 2019 (\$5.6 million) and the Voluntary Workforce Option Program in 2020 (\$9.1 million). Please see Exhibit 1, Tab 9, Schedule 1, paragraphs 31 and 32 for more details.

Answer to Interrogatory from
Energy Probe Research Foundation (EP)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3 Plus Attachments, Page 3 of 44, Table 1

Preamble:

(Paragraph 6) "The reduction of EGD and Union FTEs in 2018 was largely the result of centralization brought about by the Enbridge and Spectra Energy Corp (Spectra) merger. FTEs in the areas of Human Resources (HR), Technology Information Systems (TIS), and Finance are examples of the larger functional groups that were transferred to Central Functions (CF)."

Question(s):

- a) Please provide the legacy FTE (2015-2017) related to performance of the utility functions that were subsequently transferred to Enbridge Inc.
- b) Please provide the number of FTEs transferred from EGD and Union to EI and the dates of the transfers.
- c) Please provide the net FTEs in the utilities performing post transfer to EI.
- d) Please provide an average O&M cost per FTE.
- e) Please provide the legacy costs for the 15 functions now part of Centralized Functions. Separate charges from EI and in-house costs for 2015-2017.
- f) Please provide In-house costs and Centralized Functions costs 2018-2022. Reconcile 2022 data to Figure 1 and the 2022 Intercorporate Service Agreement

Response:

- a) Please see Table 1 for EGD and Union FTEs for 2015-2017.

Table 1
EGD and Union FTEs

Line No.	Year	EGD	EGD	EGD	Union	Union	Union
		FTE	CF	Adjusted FTE	FTE	CF	Adjusted FTE
		(a)	(b)	(c)	(d)	(e)	(f)
1	2015	2,130	448	1,682	2,253	492	1,761
2	2016	2,063	366	1,697	2,272	486	1,785
3	2017	1,934	302	1,632	2,239	425	1,814
4	2018		296	1,639		395	1,810

- b) 296 employees from EGD and 395 employees from Union were transferred to Enbridge Inc. in 2018.
- c) Please see response at part a).
- d) Average Enbridge Gas O&M cost per FTE based on the 2024 Test Year Forecast is \$91,400 excluding benefits and \$123,300 including benefits.
- e) Please see response at Exhibit I.1.9-EP-2, part b).
- f) Please see response at Exhibit I.1.9-EP-2, part b) for in-house costs and part d) for reconciliation to the Intercorporate Service Agreement.

The costs used to produce Figure 1 in Exhibit 4, Tab 4, Schedule 3 represent net O&M costs. Please see reconciliation Table 2.

Table 2
2022 CF Costs Reconciliation
(ISA vs Figure 1 in Exhibit 4, Tab 4, Schedule 3)

	2022 Estimate (\$ millions)	References
CF Costs (gross O&M)	336.7	Row 16, column (ab) in attachment for response to Exhibit I.1.9-EP-2, part b).

Answer to Interrogatory from
Energy Probe Research Foundation (EP)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Pages 16-18, Paragraphs 41-48; page 22; Figures 1 and 2

Preamble:

“Departmental O&M costs for Finance, Legal, TIS, PAC, HR, Benefits, SCM, S&R and Real Estate and Workplace Services (REWS) were embedded within EGD and Union’s departmental O&M in 2017. The majority of departmental O&M in Figure 1 shifted to CF costs in 2018 upon the creation of CFs and implementation of the CFCAM.”

Question(s):

- a) Please provide by service area the Data for the EGI RCAM and Union Corporate in-house departmental O&M costs 2015-2017 with references to case filings.
- b) Please provide the amounts paid to EI for Corporate services 2015-2017.
- c) Please provide the legacy 2015-2017 (prior to CFCAM) departmental costs for each of Finance, Legal, TIS, PAC, HR, Benefits, SCM, S&R and Real Estate and Workplace Services (REWS).
- d) Please provide the Reductions in annual departmental costs under CFCAM.
- e) Please provide the CFCAM amounts for Union and EGI 2018-2024 and total.
- f) Has the CFCAM been filed previously? Please provide references.
- g) Has the OEB approved the CFCAM costs in any rate case since 2017. If so, please provide the case filings and references.

Response:

- a) Please see response at Exhibit I.4.4-EP-2 part b) for the data by service area and Exhibit I.4.4-EP-2 part c) for the reference to case filings.

- b) Enbridge Gas believes the reference to 'EI' above should read 'Spectra Energy Corp and Affiliates (Spectra) and Enbridge Inc.(EI). Paid amounts below are based on the corporate cost allocations for Spectra and Enbridge Inc. from 2015 to 2017. Allocated amounts included in utility O&M may have differed due to adjustments (e.g. RCAM for EGD).

\$ millions	Paid to Spectra Energy	Paid to Enbridge Inc.
2015	4.5	53.3
2016	6.1	51.7
2017	6.8	51.2

- c) Please see response at Exhibit I.4.4-EP-2 part b).
- d) Please see response at Exhibit I.4.4-EP-2 part b) which presents the reductions in in-house (Enbridge Gas) department costs in 2018 when those Central Functions were centralized.
- e) Enbridge Gas believes that the reference to 'Union and EGI' above should read 'Union, EGD and Enbridge Gas'. Please see Table 2 for the CFCAM allocated costs for each entity from 2018 to 2024.

Line No.	Description	<u>2018</u> Actual (a)	<u>2019</u> Actual (b)	<u>2020</u> Actual (c)	<u>2021</u> Actual (d)	<u>2022</u> Estimate (e)	<u>2023</u> Bridge Year (f)	<u>2024</u> Test Year (g)
1	Union	125.2	0.0	0.0	0.0	0.0	0.0	0.0
2	EGD	105.3	0.0	0.0	0.0	0.0	0.0	0.0
3	Enbridge Gas	0.0	237.3	244.6	279.8	336.7	352.9	377.1
4	CF Costs	230.5	237.3	244.6	279.8	336.7	352.9	377.1

- f) No, the CFCAM as filed in Exhibit 4, Tab 4, Schedule 3 and within Appendix B of Attachment 3 has not been filed previously by Enbridge Gas.
- g) Enbridge Gas believes the question refers to the approval of CFCAM and cost consequences in any EGD, Union or Enbridge Gas rate case (including Earning Sharing Mechanism (ESM) and Deferral Disposition filing) since 2017. Prior to the

implementation of the CFCAM in 2018, RCAM costs or affiliate expenses were approved as part of O&M in each of EGD and Union's 2017 ESM and Deferral Disposition filings. After implementation of CFCAM in 2018, EGD, Union Gas and Enbridge Gas CFCAM costs were approved as part of O&M in 2018 to 2021 ESM and Deferral Disposition filings per Table 3.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Energy Probe Research Foundation (EP)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3 Plus Attachments, Page 26

Preamble:

“The CFCAM uses a combination of three types of cost drivers: consumption-based, static and a blended, multifactor driver (three-factor formula or 3FF). The 3FF is underpinned by the concept that the extent of utilization of a CF is driven by the size and contribution by a LOB. The 3FF is used to allocate costs that benefit the entire enterprise and is an appropriate driver to use as it creates a proxy for cost causation through representation of scale by number of people, capital and revenue of an organization and is discussed further in the CFCAM Study provided at Attachment 3 and the ISA provided at Attachment 4 and discussed in Section 2.3. Please see Attachment 5 for a list of CF costs and cost drivers for the 2022 Estimate and 2024 Test Year.”

Question(s):

- a) For each CF, please provide allocation to each LOB and Total Corporate Cost for 2018 2022 estimated and forecast 2024.
- b) Why do the Totals in attachment 4 and Attachment 5 differ? Please reconcile.

Response:

- a) Please see response at Exhibit.I.4.4-VECC-56 part a).
- b) Table 1 reconciles the 2022 Estimate from Exhibit 4, Tab 4, Schedule 3, Attachment 4 (ISA) to Exhibit 4, Tab 4, Schedule 3, Attachment 5, updated March 8, 2023.

Table 1
2022 Estimate (\$ millions)

1	Central Service Allocations per ISA	327.6
2	Direct-charged costs	4.8
3	Insurance	15.7
4	Less:	
5	Unregulated costs (1)	(0.5)
6	Utility adjustments (2)	<u>(10.9)</u>
7	CF Costs (3)	<u><u>336.7</u></u>

Notes:

- (1) Allocations to the unregulated business have been included as allocations in the ISA and excluded from utility earnings
- (2) Utility adjustments for Aviation, Chief Development Office and Depreciation. These are the Estimate equivalent of the 2022 Budget Adjustments shown at Exhibit 4, Tab 4, Schedule 3, Attachment 3, page 28.
- (3) Exhibit 4, Tab 4, Schedule 3, Attachment 5, Line 16, updated March 8, 2023

ENBRIDGE GAS INC.

Answer to Interrogatory from
Energy Probe Research Foundation (EP)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 3, *Guidehouse Report*, Page 8

Question(s):

- a) Did Guidehouse review historic Corporate Central services starting pre-merger in 2017? And then post-merger 2019-2021? Please Indicate which years and utilities.
- b) How much of the Budgets for 2022, 2023 and 2024 did Guidehouse review? Provide details by service areas.
- c) Please provide the working papers for Prong 1 tests for each service for each year. Please provide budget amount, the amount reviewed and percentage.
- d) Please provide Working Papers for Prong Two tests.
- e) How did Guidehouse determine that Prong Two tests were appropriate and the proposed CF cost allocations are allocated appropriately to the affiliates based on the application of Cost Drivers, supported by principles of cost causality? Please provide details at LOB level and below.
- f) With regard to Prong/Test 3, please provide Working Papers for the Guidehouse Prong 3 cost/ benefit analysis for each CF, including the peer group benchmarking.

Response:

This response was provided by Guidehouse Canada Ltd.:

- a) Guidehouse's scope of work was limited to the independent review of the current cost allocation model - the CFCAM and therefore the CFCAM-derived 2022 Budget and 2022 Forecast were reviewed (which also forms the basis for the 2024 escalated Forecast). Guidehouse did not review historic corporate central and/or shared services models. Please see Exhibit 4, Tab 4, Schedule 3, Attachment 3, Guidehouse Report page 3 for Guidehouse's scope of work.

Guidehouse did review, in some cases, the regulatory record and past cost allocation model-related reports on the public record to set context and develop deeper understanding of cost allocation principles, timelines and methods at Enbridge Inc. and Enbridge Gas that started before the Spectra merger.

- b) Guidehouse reviewed all CF cost allocations and Service categories in the 2022 Budget. A materiality threshold was applied for the purpose of prioritizing service category interviews with service providers and recipients to ensure focused and effective assessment efforts at a more granular level. Guidehouse did not review a 2023 budget. For 2022 and 2024 Forecasts, Guidehouse considered:
- Changes to the calculus or characteristics of the model, incremental to those recommended by Guidehouse during its review of the 2022 Budget to ensure the veracity and consistency of the CFCAM as applied to the 2022 and 2024 Forecasts,
 - Changes in CFs, Service Categories and/or Cost Drivers other than those recommended by Guidehouse as part of the 2022 Budget assessment, and
 - Material changes to 2022 Budget allocation amounts other than escalation factors.
- c-d) To reach its findings and conclusions, Guidehouse performed over 1600 hours of assessment and generated analytic and procedural working documents that are based on the CFCAM, as well as enterprise and financial system data outputs, spreadsheet derived data inputs, direct service category-defined interviewing procedures (see Attachment 1), ad hoc discussion and stakeholder engagement, as well as other quantitative and qualitative testing procedures. Assessments consisted of reviewing Enbridge Gas data and documents, iterative analysis based on data updates, as well as inquiries and discussions with both service providers and service recipients. Much of these working papers would not be practical to provide given the time involved to properly sanitize potentially commercially sensitive and/or superfluous and non-insightful information and address potential data privacy requirements.

Providing raw working papers alone without the benefit of the context and timeline of activities or interactions with Enbridge Gas that would be considered relevant to evaluation of the CFCAM, could lead to incorrect and/or misleading conclusions. Considering the above, Guidehouse has respectfully provided Attachment 2, as the most relevant components to the analysis and Three Prong Testing framework, and documentation of Prong 1, 2, and 3 tests.

Please see Attachment 3 for Prong Two working papers and Attachment 4 for Prong Three working papers.

The following procedures apply to Attachment 3 working papers:

- apply to the testing of the CFCAM cost driver allocation factors
 - includes application of the deemed allocation factors to the appropriate service categories determining the intended result as well as testing the integrity of CFCAM calculus
 - data from the CFCAM model was used to perform the calculations in this file
 - Guidehouse issued data request to Enbridge Gas for all relevant data including 2022 enterprise and Enbridge Gas Budget, allocation Cost Driver, allocation methodology, and allocation % where applicable
 - for 3FF allocations, Enbridge Gas provided Revenue, Salary and PPE for Enbridge Inc. and Enbridge Gas
 - Guidehouse replicated CFCAM outputs by recreating the allocation calculation for each Service Category
 - using the CFCAM outputs to verify, Guidehouse was able to reconstruct the CFCAM allocations at the Service Category level in alignment with limited real variance
- e) Guidehouse assessed all 2022 Budget allocated costs and their related Cost Drivers for appropriateness based on cost causality. For allocations that were determined to require additional investigation, Guidehouse sent written questions to Enbridge Gas. Depending on Enbridge Gas's response, Guidehouse conducted additional inquiries and interviews to satisfy itself that cost causality was rigorously considered and/or recommended adjustments when required (See Attachment 2 Tab Prong Testing_GH Questions for Prong 2 questions and Enbridge Gas responses). For details of Enbridge Gas's 2022 Budget allocation please see Exhibit 4, Tab 4, Schedule 3, Attachment 3, Table 6-3, page 28.
- f) Please see part c-d).

EGI Interview Guide

Aviation

Prepared by: Guidehouse

Background

Enbridge Inc. (EI) provides a number of Centralized Functions to its affiliates and allocates the respective costs amongst the service recipients using an internally developed Cost Allocation Methodology (CAM). As an affiliate of EI, Enbridge Gas Inc. (EGI) is a recipient of Central Functions and associated costs.

EGI is regulated by the Ontario Energy Board (OEB), and Central Function costs are governed by the OEB's Affiliate Relationships Code for Gas Utilities (ARC) which sets standards intended to minimize the potential for a utility to cross-subsidize competitive or non-monopoly activities. The ARC requires a reasonable cost allocation to be applied to all Central Functions.

In preparation for EGI's upcoming rate application, Guidehouse has been engaged to conduct an independent review of EGI's 2022 budgeted Central Functions allocations from EI in order to assess their reasonableness and appropriateness. Our review is focused on the current CAM and its delivery and will consider prior cost allocations methodologies, related independent review work and regulatory decisions as guidance to determine the prudence and reasonableness of services and service levels, as well as the efficacy of the allocation approach and related indirect allocation drivers.

The framework for the assessment of Central Functions allocations is the OEB's Three-Prong Test, which is designed to determine if Central Functions allocations are in the public interest of Ontario ratepayers based upon EGI's needs for the services (Prong 1 – the prudence of the services received), the appropriateness of the allocation methodology (Prong 2) and the relative benefits of the service weighed against its costs (Prong 3).

The focus of the first phase of our assessment will be on Prong 1, by using the questionnaire (below) as a guide for interviews. These interviews will assist us in assessing the proposed charges' prudence through confirmation of services required by Ontario ratepayers. In the OEB's view, costs will not pass the Prong 1 test if they relate to activities which:

- Go beyond the scope of services required for a utility with the scale, size and complexity of EGI;
- Are associated with overall governance from a shareholder perspective, or “minding the investment”;
or
- Represent additional and superfluous management layers.

Interview Questions

The following questions are designed to address the OEB's Prong 1 Test (EGI's need for the services), considering proposed Central Functions allocations based on the 2022 Budget (Table 2 below).

- 1) Please describe the nature of the service that EGI receives through the Central Function. Why does EGI require this service and how does it impact EGI's ability to fulfill its mission and business objectives to provide service to Ontario ratepayers? Please discuss in the context of the service categories noted in Table 1.
- 2) Describe how EGI and EI work together to deliver the Central Functions services noted in Table 1.
- 3) Describe how EGI currently ensures the services provided do not go beyond the scope required by a utility such as EGI and are therefore required by a stand-alone utility in Ontario. For example:
 - Is there an inter-corporate service agreement (ISA) that defines the scope of services and have you reviewed it?
 - Is there any training for employees regarding the ISA or responsibilities under the ARC?
- 4) Does EGI verify / validate that services as described in Table 1 were provided by EI? Please describe processes, if any, for feedback to Corporate EI on received services/service levels?
- 5) In reference to the Central Functions allocations detailed in Table 2 below, please validate that the services provided to EGI, as described in Table 1, are commensurate with the expected level of service as represented by the costs allocated through the applicable cost centres (CCs)?
- 6) Are there any material differences in service levels between 2019/2020 period and 2021/2022 period?
- 7) The third prong of the OEB's Three Prong Test assesses whether the Central Function benefits to Ontario ratepayers equal or exceed the costs. For this test, the Board has accepted the following four categories as a basis for assessing benefits:
 - a) Replacement benefits – the services provided replace an equivalent service at equal or lower cost;
 - b) Synergistic or linkage benefits – the services allow EGI to reduce costs by means of being part of the larger group and operating in concert for the procurement of products and services;
 - c) Revenue enhancement or cost recovery benefits – EGI's activities and capabilities provide value to other affiliates for which payment in cash or kind is received;
 - d) Stand-alone benefits – strategic actions and activities instituted by the Corporate Centre that produce direct value to EGI.

Provide examples of the benefits received by EGI from services provided by the Central Function, with reference to the above definitions where applicable.

Table 1. Aviation – Service Category Description

AV-01. Business Travel (Passengers)
Provide professional and efficient air service in response to company needs, and to conduct operations to the highest safety standards practical

38	CDO	Investment Review	C100103-Corporate Development US	3FF	\$ 190,212	Y	Not prudent - Ontario ratepayers should not be impacted by US services focused on US corporate development activity	Y	Not Prudent cost due to specific focus associated with US corporate development	EGI received approximately \$1.6M in corporate allocations based on Round 2 of the 2022 Budget from the Investment Review service category. The cost driver used to allocate costs from this service category to all Business Units, including EGI, is the 3FF. The 3FF was chosen as the most appropriate allocator due to the nature of the services provided by the Investment Review team. The Prong 1 interview indicated that service is a demand-pull service provided to all Business Units, including EGI. The level of service provided varies annually based on the projects proposed by the Business Units for review during the year. When the budget is created for the following year, the level of service to be provided to each Business unit is unknown at that time. Using an allocator other than the 3FF would require the Investment Review team to have knowledge of the projects they will be involved in the following year. An allocator other than 3FF would be onerous and administratively burdensome to track. For purposes of the EGI CAM study, EGI requested a high-level time estimate of the services provided and the related cost allocation to EGI in 2021. This estimate was derived on a retrospective basis based on high level assumptions and resulted in an allocation of \$843,000. High-level time forecasting is not a practical process for the Investment Review team to complete annually for each Business Unit, which has resulted in the use of the 3FF to allocate costs. The 3FF is therefore the most appropriate allocator to apply on a prospective basis. The 3FF is an example of an allocator used to allocate costs for service categories where the provider is providing service to the entire enterprise. 3FF is used as a proxy for a Business Unit's consumption of services based on its proportion of Revenue, Compensation and Gross Book Value of Property, Plant and Equipment.	PWA	Interview Summary CDO	\$ 837,153	Assessment of Corporate Development opportunities (investments) should be more case-based and 3FF is not a good proxy for causation as opposed to broad enterprise strategy where 3FF is a good proxy. Therefore, Guidehouse recommends an adjustment of 50% to the Investment Review Service Category. High level time forecasting could be an option as an allocator (consistent with other CC that are US based)
39	CDO	Investment Review	C100222-Corporate Development US II	3FF	\$ 158,471	Y	Not prudent - Ontario ratepayers should not be impacted by US services focused on US corporate development activity	-		See item #38.	PWA	Interview Summary CDO		See Item #38
46	Finance	Management Reporting, Planning, and Budgeting	C100210-Corp Business Partner	Revenue	402713.1622	Y	What is the difference between this cost centre and C100221?	-		Different SC 100210 - CC owner - Yousuf Zaki (Director & Finance Business Partner FP&A) supports the development and documentation of financial forecasts, annual budgets and the long range forecast. Also handles Corporate Cost Allocations. 100221 - CC owner - Tanya Ferguson (VP & Finance Business Partner EGI) - supports GDS' accounting and FP&A functions. Provide timely and accurate information on actual and future financial performance, partner in decision making, and manage finance operations for the GD segment. Cost of Tanya Ferguson (VP Finance and Business Partner, EGI) and Direct Reports that don't have their own teams. Focused exclusively on Gas Distribution Segment.	P	Interview Summary Finance

55	S&R	Safety	C100717-S&R Safety Operations CAN	High Level Time Forecasting	427942.4757	Y	How is this different from row 139 (C100719)?	-		CC100717 and CC100719 are in the same Service Category (Safety), but represent the headcount costs for different teams. Same time forecasting % applied to every CC grouped in SR-08 S.C. EGI recalculated the allocation for the SR-08 S.C. by applying high-level time forecasting to each CC vs. the same weighted average % across all CCs. The end result was an increase of \$100k to the total allocations received for the SR-08 Safety S.C.	P	Interview Summary S&R		
56	S&R	Safety	C100716-S&R Safety Operations US	High Level Time Forecasting	416755.6833	Y	Not prudent. US safety operations should have no bearing on EGI, especially seeing as there is a separate line item for Canadian safety operations	Q	Need to confirm why US cost centre employees are billing time to Canada Ops	Same time forecasting % applied to every CC grouped in SR-08 S.C. EGI recalculated the allocation for the SR-08 S.C. by applying high-level time forecasting to each CC vs. the same weighted average % across all CCs. The end result was an overall increase of \$100k to the total allocations received for the SR-08 Safety S.C.	P	Interview Summary S&R		
57	PAC	Stakeholder & Indigenous Engagement	C100423-Pacs Community Engment M/W Us	High Level Time Forecasting	384315.3962	Y	Check with EGI what this entails specifically, is there a portion from the US included here?	-		SC includes costs from other CCs relevant to EGI Costs are allocated at SC level based on high-level time forecasting. Immaterial difference if allocations had been applied at CC level. See PACS analysis provided previously to GH.	P	Interview Summary PAC		
40	CDO	Investment Review	C100103-Corporate Development US	3FF	\$ 190,212	N		Y	Not Prudent cost due to specific focus associated with US corporate development	See item #38.	PWA	Interview Summary CDO		See Item #38
41	CDO	Investment Review	C100105-Corporate Development CAN II	3FF	\$ 133,556	N		Y	Not Prudent cost due to specific focus associated with US corporate development	See item #38.	PWA	Interview Summary CDO		See Item #38
44	TIS	LP Application Mgmt & Support	C100921-TIS Liquids Pipelines	Directly Attributable	\$ 2,161,106	Y	Not prudent. EGI does not have liquids pipelines business, so no cost should be attributed.	Y	Allocator is clearly marked incorrectly. EGI does not have a liquids pipeline business, so direct charges are highly unlikely	Application Management & Support covered in this Service Category is for EGI as well; hence, a partial allocation to EGI from this service category is appropriate. TIS agrees that the description of this service category should be updated to exclude "LP" from its name. FP&A has logged this description for correction in January 2022. The cost driver will also be updated to another cost driver by Corporate FP&A since the amount being allocated is not 100% or "Directly Attributable".	PWE	Interview Summary TIS		Verify for adjustment when the allocator has been changes.
45	TIS	LP Application Mgmt & Support	C100922-TIS Application Operations Services	Directly Attributable	\$ 10,483,035	N		Y	During TIS interview, recipient expected this to be 3FF, because these services are centralized.	See response to #44	PWE	Interview Summary TIS		Verify for adjustment when the allocator has been changes.
58	CDO	Strategy	C600012-Strategy and Fundamentals	3FF	\$ 547,557	N		Y	Not yet causal - Need to understand why this strategy support function is allocated different than the following before appropriateness can be discussed	Discussed during CDO interview (Sarah Burns)	P	Interview Summary CDO		Sarah Burns group has overall accountability as Energy centre of excellence and houses the VP costs EGI is still fleshing out the accountabilities

Item #	Central Function	Service Category	Cost Centre	Allocation Basis	2022 Budget	Prong 1 issue?	Prong 1 question	Prong 2 issue?	Prong 2 question	EGI Response / Investigation	GH Assessment Fail / Pass "P" / Pass with Exception "PWE" / Pass with Adjustment PWA	Interview Notes	Adjustment	GH Comment
63	TIS	Technology Direction & Governance	C100901-Technology & Information Services	3FF	1915081.867	Y	Unclear what this cost centre is - it has the same name as the central function.			This CC contains costs for the SVP and Chief Information Officer who provides leadership and strategic oversight over the functions of Information Technology; Cybersecurity; Business Process Simplification; Operational Technology; Data and Digital. Bhushan has shaped the digital strategy for the company including transforming technology services into a strategic enabler for Enbridge. This CC has a negative balance (\$8.5M) in the Round 2 budget due to the application of the Round 2 TIS stretch to this CC.	P	Interview Summary TIS		
64	Legal	TIS, SCM & LSO	C100483-Legal Services	3FF	341654.9043	Y	What is the difference between the legal services here and C100475?	Q	Difference between 100483 and 475	The Service Category for CC100475 is "LE-62.Gas Utilities Law", which is allocated 100% to GDS. This SC provides EGI with legal and regulatory support including litigation: employee and labor law, incident and claims investigations; business development, community expansion and construction, customer programs and agreements; storage, transmission and gas supply businesses. The Service Category for CC100483 is "LE-59.TIS, SCM & LSO" and is allocated by 3FF. This SC provides legal services supporting TIS (commercial contracting, technology issues and cyber security), SCM (commercial contracting and related issues for materials & logistics, projects and services), and legal operations and contracts shared services teams.	P	Interview Summary Legal		
65	Legal	TIS, SCM & LSO	C100484-Corporate Legal Counsel	3FF	447958.8992	N		Q	Difference between 100481 and 484	See item #8 (same question).	P	Interview Summary Legal		
66	Finance	Treasury	C100235-FIN Treasury	Balance Sheet Debt	240246.2906	Y	What is the difference between this cost centre and C100248,C100240?	-		All 3 CCs are part of the same Service Category (Treasury), but perform different functions. CC100248 - FIN Treasury Cash Mgmt&Banking The Cash Management team strives to minimize the cost of financing for short-term liquidity needs by issuing commercial paper at the most cost-effective rate in the market, including managing EGI's \$2B external credit facility. The Banking team overlooks all banking solutions and works with Enbridge's financial service providers to maintain and manage company bank accounts and cash management services. CC100240-FIN Treasury Planning Key responsibilities include ensuring the enterprise, including EGI, has sufficient liquidity to meet obligations, while maintaining strong financial metrics to preserve investment grade credit ratings (EGI is rated by both S&P and DBRS on its long-term and short-term debt). In addition, the team provides support for the development of the cost of capital framework for growth initiatives and any large scale M&A/divestiture activities. CC100235-FIN Treasury This CC houses the costs for the VP, Treasury and Enterprise Risk and any direct reports that do not have their own CCs. The VP provides leadership, strategic direction and oversight for the enterprise-wide Treasury, Pension Investments, Risk Assessment, Risk Control and Credit functions.	P	Interview Summary Finance		
59	Finance	Tax Services	C100232-US Income Tax	3FF	\$ 1,675,897	Y	Not Prudent - Costs associated with US income tax should not impact Ontario ratepayers.	Y	Not prudent - costs are related to US tax challenges which EGI should not have.	The Tax Services Service Category comprises US and Canadian Cost Centres on both sides of the border. The services provided by various Tax teams are inter-linked and entities on both sides of the border benefit from such services. For example, CC100232 provides services for both US entities and Canadian subsidiaries of US companies. EGI is a reporting entity for US tax purposes, and CC100232 supports EGI's US tax requirements by preparing EGI's US tax returns and reviewing agreements as needed for US tax implications. Tax believes that isolating US and Canadian cost centres and applying different drivers to them will not be reasonably practicable. Therefore, the current approach of pooling all tax costs in one Service Category (Tax Services) and allocating it out to all Enbridge operating subsidiaries utilizing the Enterprise 3FF is the most reasonable approach.	PWE	Interview Summary Finance		1. Can you provide some description of the US income tax needs of EGI. Does EGI generate income in the US and what level of effort do tax professionals provide related to US income tax vs. Canadian income tax filing needs? 2. There is no Canada-specific income tax service or cost centre. Can we then assume that all Canadian income tax work is conducted by the C1000232 US Income Tax team?
37	CDO	Investment Review	C100208-Investment Review	3FF	\$ 396,504	Y	What is the difference between C100102 & this CC?	-		Same SC, different reporting level (Melissa reports into SVP Corp Development & Energy Services). 100208 includes costs for investment review team. 100102 = Corp Dev & Investment Review; Allen Capps (SVP) This CC provides services as described during CDO interview	P	Interview Summary CDO		Interview Notes: Investment Review – Guide capital allocation process and decision anything greater than 10M; 3 main service function coordinate the financial analysis on opportunity 2) analytical support for decision support 3) facilitate risk mgmt. analysis to make sure all investment decision i)Establish operate the process (stage gate) ii)Conduct and review financial analysis iii)And financial modelling relating to investment opportunity -Assess the investment opportunity -Risk mgmt. for mitigation plan
60	Finance	Tax Services	C100231-FIN Property Tax US/CDN	3FF	\$ 1,254,289	Y	No Prudent - Costs associated with US property tax should not impact Ontario ratepayers.	-		See #59. Table 6-4 Summary of Prong 1 Adjustments

Central Function	Service Category	Budgeted Allocation	Adjustment	Adjustment Rationale	Detailed Rational for Reference Only
Aviation	Business Travel (Passengers)	\$2,248,940	\$2,248,940	Portion of Aviation CF allocation deemed not prudent. Usage of corporate jet for business travel is unnecessary for a utility solely based in Ontario.	3FF is not appropriate allocator to proxy for cost causation in the service category of Business Travel. EGI EVP and President utilized corporate aviation 3 times in 2019. Recommend adjustment to allow for the cost of 3 commercial flights at \$1,500 each = \$4,500
Depreciation	Depreciation	\$19,682,282	\$268,792	Corporate jet depreciation related to business travel and depreciation of certain IT asset not providing benefit to EGI is deemed not prudent	
Total		\$21,931,222	\$2,517,733		

Table 6-5 Summary of Prong 2 Adjustment

Central Function	Service Category	Cost Driver	Budgeted Allocation	Adjustment / Exception	Adjustment	Adjustment Rationale
CDO	Investment Review	3FF	\$1,616,975	Pass with Adjustment	\$808,488	Insufficient evidence of cost causality.
Finance	Tax Services	3FF	\$4,818,146	Pass with Adjustment	\$1,602,817	Insufficient evidence of cost causality.
Total		Total	\$6,435,121		\$2,411,305	

Detailed Rationale for Reference Only
Certain aspects of investment review are based upon levels of investment opportunities being reviewed at the enterprise level impacting all affiliates, while others are discrete investment review requirements of the EGI Utility. In the latter case, cost causation is tied to the number of investments being reviewed for which 3FF is not a strongly linked proxy. Based on high level time forecasting, a 50% adjustment for the Investment Review service category is recommended.
Guidehouse notes that some income tax service costs resulted from US tax services through 3FF allocation driver.

QA check	Addition Year	Initiative ID	Initiative Title/Asset Description	Solution Type	Cost	Depreciation	EGI Depreciation	EGI's Comment
Yes	2022	50161	Cloud Program Phase 3 - Application Modernization Factory	Introduction of New Technology	8,300,000.00	715,875.00	164,651.25	This project is to migrate various applications to cloud based applications that will allow for standardization across the enterprise, automation and better security. This will benefit EGI as many of these apps are used by EGI employees as part of their day to day processes.
Yes	2022	50188	IS - vBlock Lease Payment - Year 3 of 5 (Lebanon/Carrollton)	Annual Licensing / Maintenance Payments	7,187,500.00	619,921.88	142,582.03	Related to software licenses and hardware maintenance at the data centers in Ohio and Texas. EGI benefits from these assets as all BUs make use of the corporate data centre to use network or cloud based software that run through the data centers.
Yes	2022	50213	IS - Network Lifecycle & Maintenance Program (Corp) 2022	Upgrade to Existing Technology	7,082,897.00	610,899.87	140,506.97	This project is to maintain crucial network infrastructure at Canadian Data Centres, replacing aging and end of life equipment. EGI benefits from these assets as all BUs make use of the corporate data centre to use network or cloud based software that run through the data centers.
Yes	2022	50202	IS - vBlock Lifecycle & Replacement (ICS/SRP vBlock) 2022	Upgrade to Existing Technology	7,000,000.00	603,750.00	138,862.50	After further review, EGI does not benefit from this initiative
Yes	2021	300000234	P.03 2021 Microsoft SCE Licenses	BACK END SOFTWARE LICENSES-2 YEAR TERM	3,326,357.77	1,663,178.89	382,531.14	Relates to the costs of Microsoft cloud licensing for Microsoft software such as Office and Sharepoint. EGI benefits from this upgrade as EGI employees currently use Windows 10, Office and sharepoint for daily activities.
Yes	2021	3589271	N.01 - Device Mgmt Transformation EI - AB9505	OFFICE FURN & EQUIP-COMP EQUIP MACRO&WP	19,046,742.83	3,285,563.14	755,679.52	Relates to the cost of upgrading the entire corporation to Windows 10 from Windows 7. EGI benefits from this upgrade as EGI employees currently use Windows 10 on their computers to perform their daily tasks.
Yes	2020	3561453	Phase 1 purchase asset Investment Planning (AIP) software from	INTANGIBLE ACQUIRED SOFTWARE APPLICATIONS \$500,000 A	13,152,645.11	1,444,160.43	332,156.90	Copperleaf is an Asset Investment Planning software used by LP, GDS and GTM, therefore EGI receives benefits.
Yes	2020	3522448	P.03 2019 Microsoft EA - EI - Maintenance AGMT - Software	INTANGIBLE ACQUIRED SOFTWARE APPLICATIONS \$500,000 A	6,358,443.90	698,157.14	160,576.14	2019 Microsoft EA - EI asset is the costs of Microsoft Enterprise licenses. EGI benefits as EGI employees use Microsoft software for business process and communications.
Yes	2019	3522449	P.01 - vBlock Lease 2019-2023 - Computer Hardware	COMP EQUIP MAINFRAME FOR NON CTRL APPS	13,618,891.56	2,349,258.79	540,329.52	The 2 vBlock assets are related to data center hardware and/or software licenses for the data centers located in
Yes	2019	3531442	4 year agreement for the vBlock/VMax system hardware	COMP EQUIP MAINFRAME FOR NON CTRL APPS	7,460,477.35	1,286,932.34	295,994.44	The Storage sustainment project are assets that improved data storage and backup environments. EGI benefits from all these assets as all BUs make use of the corporate data centres and backup environments to use network or cloud based software that run through the data centers.
Yes	2019	3515448	P.01 2018 Storage Sustainment - Computer Hardware	COMP EQUIP MAINFRAME FOR NON CTRL APPS	4,742,332.28	818,052.32	188,152.03	The Infrastructure sustainment project are assets that replaced aging or end-of-life equipment at all Business Unit (BU) offices and the core data centers. EGI benefits from all these assets as all BUs make use of the corporate data centres and backup environments to use network or cloud based software that run through the data centers.
Yes	2019	3515446	P.01 2018 Infrastructure Sustainmnt - Computer Hardware	COMP EQUIP MAINFRAME FOR NON CTRL APPS	3,406,282.97	587,583.81	135,144.28	Workday is a cloud based HR system that incorporates all HR information into 1 place. It allows employees and people leaders to input, track and approve goal setting and performance reviews, request and approve vacation and other time off, allow hourly employees to input and track their time, look for other job opportunities within Enbridge and other HR related tasks. EGI benefits from Workday as EGI employees use Workday for their HR needs as previously described.
Yes	Pre-2019	3391401	WORKDAY	INTANGIBLE ACQUIRED SOFTWARE APPLICATIONS \$500,000 A	15,731,553.60	1,727,324.59	397,284.65	Oracle e-Business Suite R12.1.3 (Oracle R12) is the Enterprise Financial System currently used by legacy EGD. All of EGD's financial entries flow through Oracle R12 and eventually flow up to EGI's financial statements. All EGI employees also submit and track expenses through Oracle R12. EGI benefits from this software as it is houses EGD's General Ledger which make up a portion of EGI's financial statements.
Yes	Pre-2019	3368058	Oracle e-Business Suite R12.1.3 Reimplementation	INTANGIBLE ACQUIRED SOFTWARE APPLICATIONS \$500,000 A	40,128,542.12	4,406,113.92	1,013,406.20	OBIEE is a web-based solution that is directly connected to Oracle R12 and allows users to quickly query Oracle R12 data. EGI benefits from this software as many EGI departments, including O&M, A/P and SCM use OBIEE as part of their business processes.
Yes	Pre-2019	3368060	Oracle Business Intelligence (OBIEE) 11.1.1.7	INTANGIBLE ACQUIRED SOFTWARE APPLICATIONS \$500,000 A	15,341,473.27	1,684,493.77	387,433.57	Hyperion Financial Management (HFM) is the software used to consolidate EGI's 2 legacy companies financial systems to create EGI's financial statements.
Yes	Pre-2019	3368059	Hyperion 11.1.2.2 (Hyperion Financial Management-HFM)	INTANGIBLE ACQUIRED SOFTWARE APPLICATIONS \$500,000 A	11,997,676.96	1,317,344.93	302,989.33	Oracle SAAS is the software used to simplify, standardize and automate business processes, data and systems across

		Increase over 2022 Budget		12%		Increase over 2022 Forecast	-49%

Variances:

Unless specifically described below, drivers of variances include:

- 1) 3FF % for 2+10 was updated to 2021 actuals (vs. 2020 actuals used for 2022B). 2021 actuals = 23.53% vs. 2020 actuals = 22.9%.
- 2) Increased cost pressures

Drivers of variances specific to functions include:

- 1) PAC - Multi-year brand reputation program
- 2) TIS - enhanced TIS security. Costs being incurred by Enbridge as a result of the increased cyber-security threats to Energy companies and the requirements of companies to improve their TIS systems & controls.
- 3) SCM - increase in directly attributable charges of \$3.7M to better reflect cost causality
- 4) Benefits - increases in share price assumption and incentive multipliers resulting from better than anticipated company performance; higher headcount
- 5) Insurance - change in enterprise-wide insurance strategy resulting in lower premiums

Asset Bucket	Depreciation to EGI	Depreciation to EGI (rounded)	Notes
Pre-2019 assets	6,912,432	6.9	3
Spectra assets	2,469,671	2.5	1
Unify assets (ERP)	2,833,703	2.8	2
2019 -2022 additions	7,336,545	7.3	3
Total	19,552,351	19.6	4
Depreciation Aviation	129,930		268,792
Total Depreciation	19,682,281		
Depreciation IT	138,863		
	19,543,419		

Notes:

1. A large portion of depreciation on Spectra assets is directly attributed to a specific BU (GTM). The remaining depreciation, related to the ERP SAP Financial system used by legacy Union and other TIS assets, is allocated to all business units using the 3FF. EGI receives benefits from these assets. **Excludes \$129k of amortization on airplane as EGI does not receive benefit.**

2. Unify is a multi-year transformational initiative that has simplified, standardized and automated business processes, data and systems across Finance, Supply Chain Management and Asset and Work Management - enabling a more integrated way of working. It has eliminated the use of various legacy systems used previously onto 1 common platform. EGI will implement Unify in 2024. EGI receives benefit in 2022 as many of the Central Functions that provide service to EGI implemented Unify in 2021. See "Unify detail" tab.

3. See Pre-2019 and 2019 - 2022 detail tabs. Assets have been identified as providing benefit to EGI.

4. EGI removed Aviation depreciation as it did not provide benefits. However, for the purpose of the CAM report we need to add it back to tie it back to the recommended adjustment

RE: SCM allocations

Cristina Metelski
To Paul Baxter
Retention Policy Workspace (4 years)
Internal

Hi Paul

The cost driver is based on the 2020 spend information that was pulled from Power Advocate.

Business Area	Total (Spend USD)
LIQUIDS PIPELINES	\$2,527,053,271.91
GAS TRANSMISSION AND MI...	\$1,881,783,298.65
GAS DISTRIBUTION	\$1,141,719,348.53
CORPORATE	\$504,811,926.77
GREEN POWER AND TRANS...	\$108,341,154.33
NON CONSOLIDATING ENTI...	\$92,564,421.76

	Allocation Amount	Allocation %
Total Allocation	12,414,729	100%
1 Step Allocation		
L19502		0.0%
SCM Spend		
GDS	2,482,946	20.0%
Allocation Calculation		
L19502	-	0.0%
EGI	2,423,355	97.6%
EGI	2,423,355	19.5%
Allocation as per R2 Budget	2,423,596	
Variance	241	

Here are our calculations for the three business units SCM allocates to:

Cost Driver Data:

USD, \$M	Spend	
LP	2.5	45%
GTM	1.9	35%
GDS	1.1	20%
Total	5.5	100%

ENBRIDGE GAS INC.

Answer to Interrogatory from
Energy Probe Research Foundation (EP)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 3, *Guidehouse Report*, Page 17

Question(s):

- a) Please explain how net revenue is defined with reference to EGI financial statements. Specifically, does it exclude gas costs (commodity) and include distribution revenue?
- b) Why is gross book value rather than net book value appropriate?
- c) For each service that uses the 3FF allocation factor, please indicate the amounts and percentages allocated by the factor.
- d) Please compare EGI to comparable Canadian utilities in terms of the modified 3FF allocation factor.

Response:

- a) In relation to Enbridge Gas's financial statements, net revenue is calculated as "Total Operating Revenue" minus "Gas commodity and distribution costs". Total operating revenue includes distribution revenue.
- b) As noted on page 17 of the Guidehouse Report (Exhibit 4, Tab 4, Schedule 3, Attachment 3), Enbridge Gas uses the Modified Massachusetts Formula which permits the use of gross book value. Enbridge Gas has a long history of operations, and several older assets would have significantly low net book value due to accumulated depreciation over time. An allocation based on net book value would disproportionately favor older assets and systems, which may not be indicative of the amount of resources they consume.

The following response was provided by Guidehouse:

- c) Enbridge Gas's modified three-factor formula weights Payroll, Gross Book Value of PP&E, and Revenue equally (i.e. ~33.3% each). Exhibit I.4.4-EP-71 Attachment 3,

page 1 provides the value of each 3FF component for Enbridge Inc and Enbridge Gas. This information can be used to calculate 3FF factor attribution for each Service Category that uses 3FF as a Cost Driver.

d) The following response was provided by Guidehouse:

Please refer to the response to Exhibit I.4.4-STAFF-165 for a list of utilities that use a modified 3FF for cost allocation.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Energy Probe Research Foundation (EP)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 3, *Guidehouse Report*, Table 4.1

Question(s):

- a) Does Guidehouse agree Time Forecasting is the most transparent allocator?
- b) Was Time forecasting applied at the Segment level or LOB? Please discuss.
- c) With regard to High Level Time Forecasting, how many services use HLTF? Please list, and if HLTF is partial indicate approximate percentage of costs with HLTF.

Response:

- a) The following response was provided by Guidehouse Canada Ltd.:

No. Time forecasting is a reasonable, albeit higher-level representative approach to time-based cost allocation. Implementing a time billing system which would deliver more accurate real-time and actual accounting of time would be the most transparent means to allocate FTE costs but is often deemed unreasonable for internal costing purposes as it would be too organizationally complex, difficult and costly to deliver.

- b) Yes, high level time forecasting is applied at the segment level, as well as the sub-segment level in some instances. Enbridge Gas's regulated LOB accounts for approximately 99% of the GDS segment.
- c) Cost drivers are applied to the entire service category. High-level time forecasting was used as the cost driver for the following service categories within the 2022 Estimate, with the associated percentages as outlined in Table 1.

Table 1
Services Using High Level Time Forecasting – 2022 Estimate

Line No.	Central Function	Service Category	% Allocated

ENBRIDGE GAS INC.

Answer to Interrogatory from
Energy Probe Research Foundation (EP)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 3, *Guidehouse Report*, Page 24, and Table 6-2

Preamble:

5.3 Limitations of the Review

Guidehouse's review consisted of inquiry and analytical procedures related to information provided by Enbridge. Guidehouse relied on the representation of the staff, management, and executives of the Enbridge companies, and therefore EGI retains responsibility for the accuracy and completeness of the data provided. Guidehouse did not independently audit or verify the data received. Guidehouse reviewed the CFCAM model itself and did not perform a detailed examination of underlying transactions, or validate source records, except as specifically noted in our approach."

Question(s):

- a) Did Guidehouse run the CFCAM model to verify the 2022, 2023 and 2024 results?
- b) Why are the 2022 Budgets before adjustments, different than filed in evidence by EGI?

Response:

- a) No, Guidehouse did not run the CFCAM model. As provided at Exhibit 4, Tab 4, Schedule 3, Attachment 3, page 21, "The underlying CFCAM formulas, as well as the application of Cost Drivers, were functionally tested to ensure allocation outcomes were consistent with the model."
- b) Exhibit 4, Tab 4, Schedule 3, Attachment 3, Guidehouse Report, page 28 is the 2022 Budget for central functions costs.

Exhibit 4, Tab 4, Schedule 3, Table 3 is 2022 Estimates for central function costs.

The 2022 Budget analyzed in the Guidehouse Report consists of a 12-month forecast for 2022. The 2022 Estimate in evidence consists of year-to-date February 2022 actuals and a forecast for the remaining 10 months of the year. Guidehouse performed its analysis on the 2022 Budget as it was the best available information at the time of substantive field work. The 2022 Estimate incorporates adjustments to reflect the findings from the Guidehouse Report.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Energy Probe Research Foundation (EP)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 3, *Guidehouse Report*, Page 27, and Table 6-3

Preamble:

Review Summary

“Guidehouse’s assessment resulted in adjustments to Indirect Costs in three CFs and Depreciation, totaling \$4,929,037 which represents 1.5% of total allocated costs. Prong One adjustments totalled \$2,517,733 and Prong Two adjustments totalled \$2,411,305. All CFs passed the Prong Three Test post adjustments. Table 6-3 summarizes the result of Guidehouse’s CFCAM review.”

Question(s):

- a) Has EGD or Union paid for aviation services in 2018-2021? If so, what were the amounts?
- b) Please indicate which allocated costs that passed the Prong One Test (\$321,198,894) were carried forward into the Prong Two Test.

Response:

- a) Enbridge Gas was allocated the following aviation charges in 2018 to 2021 as shown in Table 1.

Table 1
Aviation Charges

Year	Aviation Charges Allocated (\$ millions)
2018	0.7
2019	2.3
2020	2.2
2021	1.5

However, Enbridge Gas notes that none of the above charges were included in utility O&M during any of these years, similar to the 2022 Estimate as noted in Exhibit I.4.4-SEC-190.

- b) As can be derived from Exhibit 4, Tab 4, Schedule 3, Attachment 3, Table 6-3, the costs in Table 2 passed the Prong One Test and were carried forward into the Prong Two Test.

Table 2
Allocated Costs Passing Prong One

Central Function	Allocation (\$ millions)
Aviation	0.0
Corporate Development Office	3.2
Enterprise Asset and Work Management	1.7
Executive	1.0
Finance	35.3
Real Estate and Workplace Services	28.1
Human Resources	22.9

Public Affairs and Communications	5.8
Safety & Reliability	7.1
Supply Chain Management	7.8
Technology Information Systems	101.2
Benefits	51.5
Depreciation	19.3
Insurance	22.0
Total	321.2

ENBRIDGE GAS INC.

Answer to Interrogatory from
Energy Probe Research Foundation (EP)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 3, *Guidehouse Report*, Page 30, 6.2.3 Prong Three Test Results: Cost Benefit

Preamble:

“Guidehouse did not perform comparative analysis for all CF allocations due to lack of publicly available information. Guidehouse selected twelve utilities that would most likely have publicly available data for comparison with EGI. Additional consideration was given to ensure some Canadian and Ontario based utilities would be represented. Due to the limited number of comparable gas distribution utilities in Ontario, Guidehouse also considered and included Ontario electric utilities such as Hydro One and Toronto Hydro based on comparability of scale, complexity, and similar regulatory oversight.”

Question(s):

- a) Which services were reviewed in the Prong 3 comparative analysis? Please list with 2024 Budget for each.
- b) With regard to the Comparator group, please provide the Working Papers that compared the group to EGI. Include all of the data and scale factors. Use numbers to designate each of the ten comparators:
 - 1) Number of customers
 - 2) Annual revenue
 - 3) 3, Gross Book Value
 - 4) Total operating cost
 - 5) Total annual gas volume distributed (for gas distributors) kWh distributed (for electricity distributors)
 - 6) Customer base (percent that are residential).
- c) Why is annual revenue an appropriate factor for both gas and electric utilities?
- d) Was distribution revenue or total sales (including commodity) used? Please clarify.
- e) Was volume of electricity distributed used?

- f) Why is percentage residential customers appropriate?
- g) Please provide a table showing the base data and all scale factors for the comparator group and EGI that was calculated by Guidehouse.
- h) Why was gross assets or PPE not used?
- i) Why were other factors such as number of employees not used?

Response:

The following response was provided by Guidehouse Canada Ltd.:

- a) As summarized in Table 9-2 and Table 9-3, the central functions reviewed as part of the comparative analysis were Finance, Legal, HR, TIS, REWS, and Insurance. See the table below for the 2024 Forecasted Budget for each Central Function reviewed in the comparative analysis:

Central Function	2024 Forecast
Finance	\$36,676,849
Legal	\$15,339,308
HR	\$25,889,488
TIS	\$139,655,173
REWS	\$28,706,895
Insurance	\$7,328,596

- b) Please see response at Exhibit I.4.4-EP-71, Attachment 4. Gross Book Value and kWh distributed were not used as part of either the comparator selection process or comparative analysis and have therefore not been included.

Toronto Hydro and Hydro One were selected to ensure Ontario utility representation of similar scale and complexity as these data were not obtained. Please see response at Exhibit I.4.4-EP-71, Attachment 4, for Total Operating Cost of the comparators.

Note - number of customers, annual revenue, total annual gas distributed, and customer base were used as a basis to select and prioritize suitable comparators to Enbridge Gas, not as part of the normalization of the comparative analysis itself.

- c) For certain central function costs, revenue is an appropriate normalizing factor for both gas and electric utilities. Total revenue is representative of the scale and complexity of the utility operation. Being applied to Legal and Insurance service types of central functions, the functional costs incurred within these services are causally linked to risk management and in general, protection of revenues.
- d) Distribution revenue was used as a normalizing factor with commodity cost (gas or electricity) being netted out for Enbridge Gas and all utility comparators.
- e) No.
- f) Utilities such as Enbridge Gas that serve a high percentage of residential customers must serve many individual customers with relatively low natural gas consumption that tends to fluctuate. Utilities that serve mostly commercial and industrial customers serve customers with much larger natural gas consumption that tends to fluctuate less. The infrastructure and operations required to service these different customer classes are sufficiently different and Guidehouse therefore used percentage of residential customers as a means to consider the makeup of utilities to prioritize comparators for the study and adopt (where possible) those utilities more like Enbridge Gas.
- g) Please see response at Exhibit I.4.4-EP-71, Attachment 4.
- h) Please see Exhibit 4, Tab 4, Schedule 3, Attachment 3, page 32 of 59; Section "Normalization Factor Determination". Gross Assets and/or PPE was considered but other normalization factors were determined to be more appropriate for the CFs evaluated as discussed.
- i) Number of full-time employees was used as the normalizing factor for HR Costs.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Energy Probe Research Foundation (EP)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 3, *Guidehouse Report*, Section and Observations -2022 Budget

Preamble:

Some allocation factors were found to be developed and calculated exogenously from the rest of the CFCAM model and applied as inputs. Exogenously calculated and recorded factors create opportunity for transcription and human error. Further implementation of automated and embedded allocation factors will enhance the CFCAM and deliver greater integrity.”

Question(s):

- a) Please list the allocation factors referred to and the associated budgets.
- b) Did Guidehouse determine which prongs were affected? Please provide details.
- c) What is meant by “deliver greater integrity”? Please clarify/discuss.

Response:

The following response was provided by Guidehouse:

- a) The allocation factor applied to LP Application Management and Support Service Category is Directly Attributable (for definition of Directly Attributable please see Exhibit 4, Tab 4, Schedule 3, Attachment 3, Section 1 of the Report) and is based on percentage attribution and calculated outside of the core model. The 2022 Budget allocation to Enbridge Gas for this service category is \$12,823,603.

- b) Guidehouse assessed the exogenous allocation factors as part of Prong 2, Cost Allocation, to test the reasonableness of the allocation factor applied, which is independent of the observation that some factors are calculated exogenously.
- c) Ensuring more automation and integration of the CFCAM, inclusive of allocation factors that can be calculated by system-derived data, increases model integrity by offering stronger controls and greater ability to check or recalculate source data.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Energy Probe Research Foundation (EP)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3 Plus Attachments, Attachment 3, *Guidehouse Report*, Page 37, Table 9-1; Attachment 5, Page 1

Preamble:

Guidehouse 2022 Budget Conclusion:

“The CFCAM delivers reasonable cost allocation that observes the tenets and principles of the OEB’s ARC and aligns to common industry practice. Overall, total CF costs of \$318,787,589 pass the Three-Prong Test. This represents approximately 98.5% of total CF costs, comprised of Direct Charge, Directly Attributable and Indirect costs.”

Question(s):

- a) What about the remainder of 2022 costs- \$17,923,009? Please list and discuss why these do/do not pass the “Three Prong Test”.
- b) With regard to the Total Budget for 2024. Did Gudehouse review the 2024 Intercorporate Service Agreement (ISA)?
- c) If so, please provide the 2024 ISA at the date reviewed. If this differs from Table 9-1 corresponding to the 2024 CF costs of \$372,446.357 please reconcile. If not, how did Guidehouse judge that the 2024 costs for the 15 CF services were appropriate?
- d) The budgets for 2022 and 2024 are shown in Table 9-1. Please provide the increase year to year and the percentages for each service area.
- e) Please reconcile the 2022 Allocations of \$326.6 M (ISA) to Table 9-1.

Response:

The following response was provided by Guidehouse Canada Ltd.:

- a) The \$17,923,109 difference noted above is actually the difference between the 2022 Budget CF Costs after proposed adjustments and the 2022 Forecasted CF Costs. These are two different sets of data used by Guidehouse as described on page 7 of the report.

As noted in Table 2-1, \$318,787,589 of the 2022 Budget CF Costs passed the Three-Prong Test. The remaining \$4,929,037 did not pass the Three-Prong Test. There were no adjustments made to the 2022 or 2024 Forecasted data. This is provided at Exhibit 4, Tab 4, Schedule 3, Attachment 3, page 8.

For details of Guidehouse’s approach to its analysis of 2022 Forecast and 2024 Forecast, please see response at Exhibit I.4.4-EP-71 part b).

- b) Please see response at Exhibit I.4.4-EP-82 part a).
- c) Guidehouse used the current ISA and assumed the 2024 forecast was, for analytic purposes, based on the same ISA and no changes to services.

The following response was provided by Enbridge Gas:

- d) Variances (M\$ and %) have been provided for Table 9-1 per Exhibit 4, Tab 4, Schedule 3, Attachment 3 in the following table:

Central Function	2022 Estimate \$M	2024 Test Year \$M	Variance (\$) \$M	Variance (%)
Aviation	-	-	-	-
Corporate Development Office	2.4	2.5	0.1	4.2
Enterprise Asset and Work Management	1.8	1.9	0.1	5.5
Executive	1.1	1.1	-	-
Finance	35.0	36.7	1.7	4.9
Real Estate & Workplace Services	27.4	28.7	1.3	4.7
Human Resources	24.7	25.9	1.2	4.9
Legal	14.7	15.3	0.6	4.1
Public Affairs and Communications	6.3	6.6	0.3	4.8
Safety & Reliability	7.2	7.5	0.3	4.2
Supply Chain Management	11.7	12.2	0.5	4.3
Technology Information Systems	108.3	139.7	31.4	29
Benefits	60.3	61.4	1.1	1.8
Depreciation	20.0	25.6	5.6	28

Insurance	15.7	7.3	(8.4)	(53.5)
Total CF Costs	336.6	372.4		

e) Please see response at Exhibit I.4.4-EP-70 part b).

ENBRIDGE GAS INC.

Answer to Interrogatory from
Energy Probe Research Foundation (EP)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 3, *Guidehouse Report*, Tables 9-2 and 9-2

Question(s):

- a) Does Guidehouse agree that Cost/benefit analysis should compare like to like costs?
- b) Please provide the Working Papers used to Produce Tables 9-1 and 9-2. Include data on normalizing factors for EGI and for all comparator companies.
- c) What specific Normalizing Factors were applied to costs in Table 9-1 to arrive at the EGI costs in Table 9-2? Provide these for each CF service.
- d) Were scale/normalizing factors applied to the comparator sample to arrive at the minimum, average and maximum? If so, provide these for each of the sample and the composite (min. average and max) for each service.
- e) Please explain why the normalized factors should be used? Provide references.
- f) Where does the ARC state that applying normalizing factors is an appropriate methodology?
- g) Please provide a version of Table 9-2 with the un-normalized costs for EGI and the ranges.

Response:

The following response was provided by Guidehouse Canada Ltd.:

- a) Not always. Functional costs may differ for many reasons, including the specific services being provided and/or the level of service. These services may or may not meet the expectations of the service recipient or the customer. More broad comparisons are used and can be an effective means to gauge cost/benefit by demonstrating that the costs of providing commonly accepted benefits are

commensurate in quantum and that is why normalization factors are used. Functional costs cannot be like to like exactly from one organization to another.

- b) Please see response at Exhibit I.4.4-EP-76 part g) for all data regarding costs and normalizing factors for Enbridge Gas and comparators used in the comparative analysis.
- c) Please see response at Exhibit I.4.4-EP-76 part g) for normalizing factors. Note that for the purpose of the comparative analysis, Benefits costs were divided and added to the remaining Central Functions weighted according to the value of each other Central Function's allocation.
- d) Minimum, average, and maximum comparable values were calculated from the normalized values of the comparators group.
- e) Normalizing factors are typical when conducting comparative review or benchmarking to better align comparisons on a consistent basis, adjusted for scale or scope. For example, if a company has only 10 employees to manage and provide services to, the human resources function may only require limited resources and incur limited costs, while for a company that employs 5,000 employees, the human resource function costs will be, as expected much higher. Normalization is required to provide insights on appropriateness of service and cost based on a comparable metric of service provided in relation to scope and is common practice in the utility industry.

For example, normalization has been applied in comparative analysis related to applications before the Ontario Energy Board including: EB-2012-0459 Exhibit D2, Tab 1, Schedule 1 Enbridge Gas Distribution Independent Evaluation of the 2013 Regulated Cost Allocation Methodology Results.

- f) To Guidehouse's knowledge, the ARC does not state that applying normalizing factors is an inappropriate methodology, nor does it provide any guidance regarding testing methodology.

The Three-Prong Test was defined in the OEB Decision with Reasons dated March 20, 1997 (ERBO 493/494) to help with cost allocation decisions. For Prong Three test, Cost Benefit, the Board has accepted Replacement Benefits, Synergistic Benefits, Revenue Enhancement and/or Stand-alone Benefits. The relative costs of these benefits to comparators is best captured with the insight provided by normalized functional cost comparison.

- g) Please see response at Exhibit I.4.4-EP-76 part g) for all un-normalized costs for Enbridge Gas and comparators.

An unnormalized comparative analysis was not completed by Guidehouse and a version of table 9-2 with unnormalized information is not available.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Energy Probe Research Foundation (EP)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 3, *Guidehouse Report*, Page 38, Table 9-2

Preamble:

Table 9-2 shows EGI benchmark costs for 6 of 15 CF areas as: Finance \$23.95 M, Legal \$7.1 M, HR \$7.64 M, TIS \$61.32 M, REWS \$181, and Insurance \$5.79 M.

Question(s):

- a) Does Guidehouse agree that the Comparator Group of 10 companies is, or is not, too small to properly benchmark EGI CF costs?
- b) Why were the 5 CF areas chosen? What about the other 10 CF areas? (Aviation, Corporate Development Office, EAWM, Executive Corporate Benefits etc.)? Why did Guidehouse not benchmark these? Please discuss in detail why the other CF areas were not benchmarked.
- c) For the referenced 3 CFs (Finance, Legal and TIS) that are above the Comparator Group Average, please provide the annual amounts (2022 and 2024) corresponding to the difference between comparator average and the EGI cost for these CFs.
- d) Please comment whether the criteria the OEB and other regulators applied to Total compensation benchmarks (i.e., a reasonable range is within 5% of the norm) should not apply to CF services.

Response:

The following response was provided by Guidehouse Canada Ltd.:

- a) Guidehouse was not mandated to conduct a benchmarking study and therefore did not determine how to "properly" benchmark Enbridge Gas CF costs in this specific case. Guidehouse conducted a comparative review of publicly available corporate shared services data, where it was available, for reasonable comparators. The

comparative analysis provides insight regarding cost expectations for certain CF functions.

We have seen in the past that full benchmarking studies for the cost/benefit component of the Three Prong Test are not necessary. By definition, a benchmark study compares very specifically defined and acquired data from a similar sample of willing participants to the study. In such a case, sample may be specifically defined. For this review, the analysis was based on comparative market data publicly available and Guidehouse's expert opinion.

Insightful benchmarks can be derived from a comparator group as small as 10 companies. Peer groups may be small depending on the unique characteristics of the company being assessed due to lack of comparable companies and/or the functional or cost subject being studied. Smaller comparator group studies include, for example, the review of the 2013 EGD Cost Allocation Study, EB-2012-0459 Exhibit D2, Tab 1, Schedule 1, only 5 to 6 comparators were used for comparative analyses.

- b) The CF areas chosen for comparative review are typical corporate functions found in any business with sufficient scale and complexity and are a necessary set of basic functions to deliver and support the mandate of the business. There may be varying specificity in the delivery and services of these core functions, but they typically exist and can be compared. The other areas are not typical of all organizations and therefore data specific enough to compare cannot be found unless a full benchmarking study is performed.
- c) Please see Tables 9-2 and 9-3 of the report which provides the Enbridge Gas amounts and average comparator amounts that would enable the calculation of difference.
- d) Guidehouse cannot comment on what is reasonable criteria in the context of general CF services benchmark, relative to previously determined compensation benchmarking ranges. Firstly, Guidehouse did not conduct a full cost benchmarking study of CF services. Secondly, CF service costs are not only related to labour compensation and are made up of a mix of labour costs, as well as other operational and capital costs. Thirdly, CF costs are also dependent on other factors such as service levels, expectations and contributions to overall human and system productivity.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Energy Probe Research Foundation (EP)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, *Guidehouse Report*, Page 39, and Attachment 5

Preamble:

“Guidehouse 2022 and 2024 Forecasts Conclusion:

Overall, 2022 CF cost allocation Forecast of \$366,710,698 and 2024 CF cost allocation Forecast of \$372,442,357 pass the OEB’s Three-Prong Test. Adjustments are not recommended. The CFCAM for the 2022 and 2024 Forecasts continues to deliver reasonable cost allocations and observe tenets and principles of the OEB’s ARC and align to common industry practice.”

Question(s):

- a) Why is Insurance shown as \$5.7 million when per Attachment 5 it is \$15.7 million in 2022? Please reconcile.
- b) “The reviewed 2022 allocations were set out in Table 6-3”. The adjusted reviewed 2022 CCAM cost was \$318,787,589. Please reconcile Attachment 5 to statement above.

Response:

- a) The \$5,788 in Exhibit 4, Tab 4, Schedule 3, Attachment 3, page 38, Table 9-2, refers to insurance costs expressed as a cost per \$ million of revenue to allow for comparison to other utilities (see “Normalizing Factor” column). The \$15.7 million of insurance in Exhibit 4, Tab 4, Schedule 3, Attachment 5 represents 2022 estimated insurance cost (not normalized) which is also provided at Exhibit 4, Tab 4, Schedule 3, Attachment 3, page 37, Table 9-1.
- b) Enbridge Gas notes that the 2022 CF cost allocation forecast amount quoted in Exhibit 4, Tab 4, Schedule 3, Attachment 3, page 39 of the Guidehouse Report was incorrectly stated as \$366,710,698. The correct number should have been \$336,710,698 and this ties to the 2022 Estimate as per Table 9-1.

The amount of \$318,787,589 on page 28 of the Guidehouse Report represents the CF cost allocations per the 2022 Budget (12-month forecast).

The amount of \$336,710,698 provided at Exhibit 4, Tab 4, Schedule 3, Attachment 5 represents the CF cost allocations per the 2022 Forecast (year-to-date February 2022 actual and 10-month forecast).

Guidehouse performed a comprehensive evaluation of the 2022 CF cost allocations budget and relied on the analysis and findings derived from its evaluation of the 2022 Budget to perform a reasonability assessment of the 2022 Forecast. The 2022 forecast presents updated cost projections as compared to the 2022 Budget and is the basis for the 2024 Forecast.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Energy Probe Research Foundation (EP)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, *Guidehouse Report*, Attachment 5 ISA

Question(s):

- a) Please provide the proposed 2024 ISA.
- b) Compare/contrast to 2022- material changes by service and total.

Response:

- a) As provided at Exhibit 4, Tab 4, Schedule 3, Attachment 4, page 7,

This Agreement shall be effective January 1, 2019 and, subject to Section 8.4 below, shall remain in effect until December 31, 2020 (the "Term"). The Term shall be automatically renewed for successive one (1) year periods unless EI or EGI delivers written notice of its intention to terminate this Agreement to the other Parties no later than six (6) months prior to the expiration of the then applicable Term. Notwithstanding the foregoing, the Term shall not extend beyond December 31, 2023 unless otherwise approved by the OEB.

The agreement effective and dated January 1, 2019, is the most current ISA and Enbridge Gas has not drafted a proposed 2024 ISA at this time.

- b) As noted in part a), Enbridge Gas does not have a draft proposed 2024 ISA to compare to at this time.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 4, Schedule 1

Preamble:

EGI references the shift to 'as a service' model many times in Tab 4.

Question(s):

Please provide a definition and the range of contexts to which it applies.

- a) Please describe how this shift will contribute to cost pressures.
- b) Please describe how this shift will improve the efficacy of the organization and outcomes for ratepayers.

Response:

- a) Please see response at Exhibit I.4.4-STAFF-142 part a).
- b) Please see response at Exhibit I.4.4-SEC-176 part b).

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 4, Schedule 2, pg. 26-27

Preamble:

In Table 5, line 5, EGI forecasts a substantial increase and relates it to Covid lifting and corporatization of insurance. However, earlier years present a revenue as a result of third-party damage recoveries.

Question(s):

Has EGI included a forecast of some recoveries for third-party damages to partially offset these substantial increases?

a) If not, why not?

Response:

a) The forecast O&M costs related to third-party damages is recovered through other revenue and therefore has no utility earnings impact. Please see response at Exhibit I.4.4-Staff-123 for a further explanation on the change in presentation.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 4, Schedule 2, pg. 26-27

Preamble:

On page 27, EGI attributes some its cost pressures to merit increases.

Question(s):

For each of the years of 2019 to 2022, please provide:

- a) The total amount of merit increases to management
- b) The merit increase amount as a percentage of total salary
- c) The percentage of management employees received a merit increase
- d) The average percentage increase provided to these employees as a merit increase
- e) The Board-approved inflation factor for that year

Response:

a-d) Please see Table 1.

Table 1
Enbridge Gas Management Merit Summary

<u>Year</u>	<u>Management Population</u>	<u>% of Management Receiving Merit Increase</u>	<u>Total Merit Increase to Management</u>	<u>Merit increase amount as a % of total salary</u>	<u>Average % increase</u>
	(a)	(b)	(c)	(d)	(e)
2019	944	98.3%	\$4.5 million	4.0%	4.0%
2020	986	99.3%	\$3.7 million	3.1%	3.1%
2021	954	99.0%	\$3.7 million	3.1%	3.2%
2022	1076	99.3%	\$4.3 million	3.3%	3.3%

e) The OEB-approved inflation factors that were used within Enbridge Gas's price cap index for 2019 to 2022 were:

- 2019: 1.37%
- 2020: 1.61%
- 2021: 2.00%
- 2022: 1.70%

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 4, Schedule 2, pg.37

Preamble:

EGL evidence states: *The 2024 Test Year Forecast includes \$51.1 million for locate delivery costs. \$45 million of the costs are for locate delivery services provided to customers and locate delivery services required for Enbridge Gas's own operations. \$6.1 million of the costs include internal company resources that provide administrative support to respond to locate requests.*

Question(s):

Please provide the supporting documents that generated these forecasts.

Response:

Please see response at Exhibit I.4.4-STAFF-122.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 4, Schedule 3, pg. 3, Table 1

Question(s):

Please update Table 1 with actual FTE's for 2022 and refine 2023 and 2024 as appropriate.

Response:

Please see the updated Table 1 for 2022 actuals. Currently, there are no changes to the 2023 and 2024 FTE Forecast.

Table 1
Employees - Full Time Equivalents

Line No.	Particulars (\$ millions)	Utility	EGD - Business Unit1 (a)	Union - Business Unit1 (b)	EGI - Business Unit (1)(2) (c)	EGI - Central Functions (1)(3) (d)
1	2013 Actual	EGD/Union	2,206	2,182		
2	2014 Actual	EGD/Union	2,194	2,220		
3	2015 Actual	EGD/Union	2,130	2,253		
4	2016 Actual	EGD/Union	2,063	2,272		
5	2017 Actual	EGD/Union	1,934	2,239		
6	2018 Actual	EGD/Union	1,639	1,810		691
7	2019 Actual	EGI			3,229	569
8	2020 Actual	EGI			2,946	526
9	2021 Actual	EGI			3,013	503
10	2022 Actual	EGI			3,182	471
11	2023 Bridge Year	EGI			3,507	546
12	2024 Test Year	EGI			3,470	546

Notes:

- (1) Number of Full-time and Part-time FTEs, excludes employees on leave and contractors as at December 31st of each year.
- (2) Business Unit FTEs are EGI employees that provide core services to the utility.
- (3) Central Functions FTEs are EGI employees that provide shared services to the utility. Their costs have been excluded from EGI Compensation amounts starting in 2018 following the Enbridge-Spectra merger as costs are allocated through the Central Functions Cost Allocation Methodology.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 4, Schedule 3, Attachments 7, 8 & 9

Preamble:

The referenced attachments state Enbridge corporate policies regarding, among other things, contracting for pipeline contractors. We would like to understand better EGI's approach to engaging pipeline contractors in major projects and how ratepayers' interests are protected.

Question(s):

Please file any additional policies or studies that address EGI's approach to retaining pipeline contractors.

Response:

Enbridge Gas adheres to its corporate policies regarding contracting for pipeline contractors as provided in attachments 1 and 2. There are additional supply chain processes that are part of and referenced in the general supply chain management policy provided, such as the Complex Sourcing Process provided at Attachment 1 and the Category Management & Sourcing Program provided at Attachment 2, both of which would apply to major pipeline projects. The [Supplier Code of Conduct](#) available on the Enbridge Inc. website applies to all suppliers, as do the other corporate policies referenced therein. The Request for Proposal (RFP) for each project/scope of work, developed in accordance with the RFX User Guide provided at Exhibit 4, Tab 4, Schedule 3, Attachment 9, sets out in more detail the specific approach that Enbridge Gas is taking for that project or scope of work and final terms will be negotiated with the contractor for the commercial agreements.

2.1	2020-10-01	Kim Movold	Article 2.0	SCM Process Framework updated

1.0 PURPOSE

The Complex Sourcing Process provides the minimum standards across Enbridge required for consistently carrying out complex purchases requiring sourcing. The process exists to:

- Ensure Supply Chain Management (SCM) resources access and adopt standardized documents and process steps that support a consistent approach to purchasing goods and services to maximize value and reduce risk
- Highlight relationships and responsibilities within the process
- Provide clarity of expectations as they relate to the process outputs:
 - Contract Development Plans
 - Contract Award Recommendations
 - Executed Contracts
- Provide the framework for compliance and process performance

2.0 SCOPE

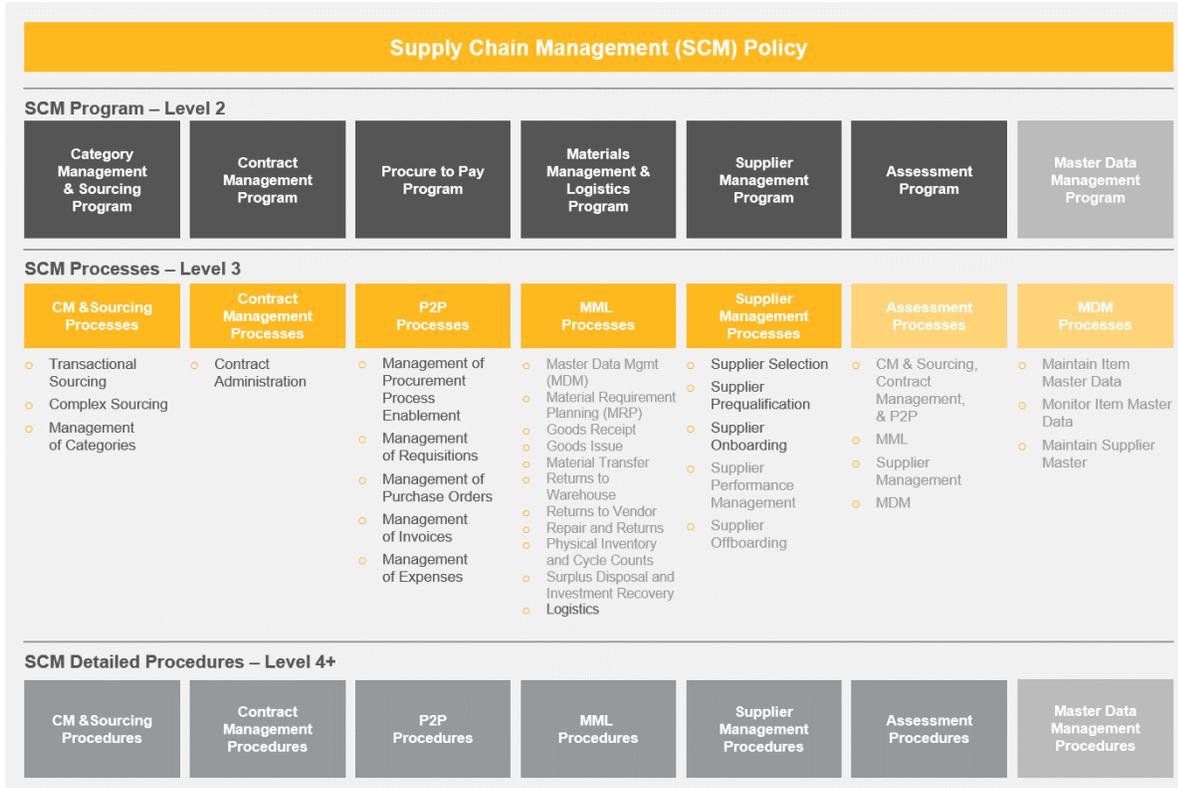

The Complex Sourcing Process corresponds to Level 3 of the SCM Governance Structure as represented in the graphic below. The Complex Sourcing Process applies to SCM and covers all categories (or sub-categories) that involve Complex Sourcing as defined below:

- The risk associated with the Business Need is considered medium to high;
- No existing approved Contract (e.g. Master Agreement managed by the Category Management Team) is in place in which a Contemplated Contract Supplement can be issued under; or
- The Business Need requires Level 2+ inspection for materials.

For more details on Complex Sourcing and associated activities please refer to the Category Management and Sourcing Program, processes, and procedure documents.

SCM Process Framework

3.0 DEFINITIONS & ACRONYMS

Please reference the Level 4 Sourcing Procedure.

4.0 ROLES & RESPONSIBILITIES

Role	Responsibilities
SCM Personnel	<p>The assigned resource that is responsible for leading the sourcing initiative.</p> <p>For the purpose of this document, the buyer will lead the process to purchase the Business Need and the SSC dispatcher will assign complete requisitions to the buyer and provide support as required.</p>
Business Stakeholder Team	<p>Identifies and provides the Business Need. Provides input into the major steps of the sourcing process. Drafts the requisition.</p>

Proponent/Supplier	A third-party organization that provides the Business Need to Company. Includes manufacturers, distributors, contractors, consultants, engineering firms, professional service providers, etc.
--------------------	--

5.0 COMPLEX SOURCING PROCESS

Compliance with this process is expected for all SCM Personnel responsible for purchases that fall within the scope of “Complex Sourcing”.

5.1 Confirm Sourcing Profile

Upon assignment of a Requisition for a Business Need, SCM Personnel will identify the sourcing requirements (including project budget and cost models for the required need), review the Category Management Team’s plan to ensure the requirement is in alignment with the strategy, and proceed to profile the supply market to develop the sourcing profile.

5.2 Develop Sourcing Plan

SCM Personnel will take elements from the sourcing profile to determine the sourcing options including, but not limited to, timing, historical spend, Supplier data (e.g. capacity, location, capabilities, size, etc.), relationships, risk, and level of competition, in order to ensure the optimal strategy(ies) are selected to meet the Business Need.

Use of approved Supplier(s) on the Enbridge Approved Supplier List (EASL) should be selected where available and the SCM Supplier Management team should be engaged as appropriate as per the requirements of the Supplier Management Program, processes, and procedures.

SCM Personnel will identify Proponents and recommend strategy(ies) using the Contract Development Plan (CDP) template for purchases estimated to be greater than \$2M.

5.3 Execute Sourcing Event

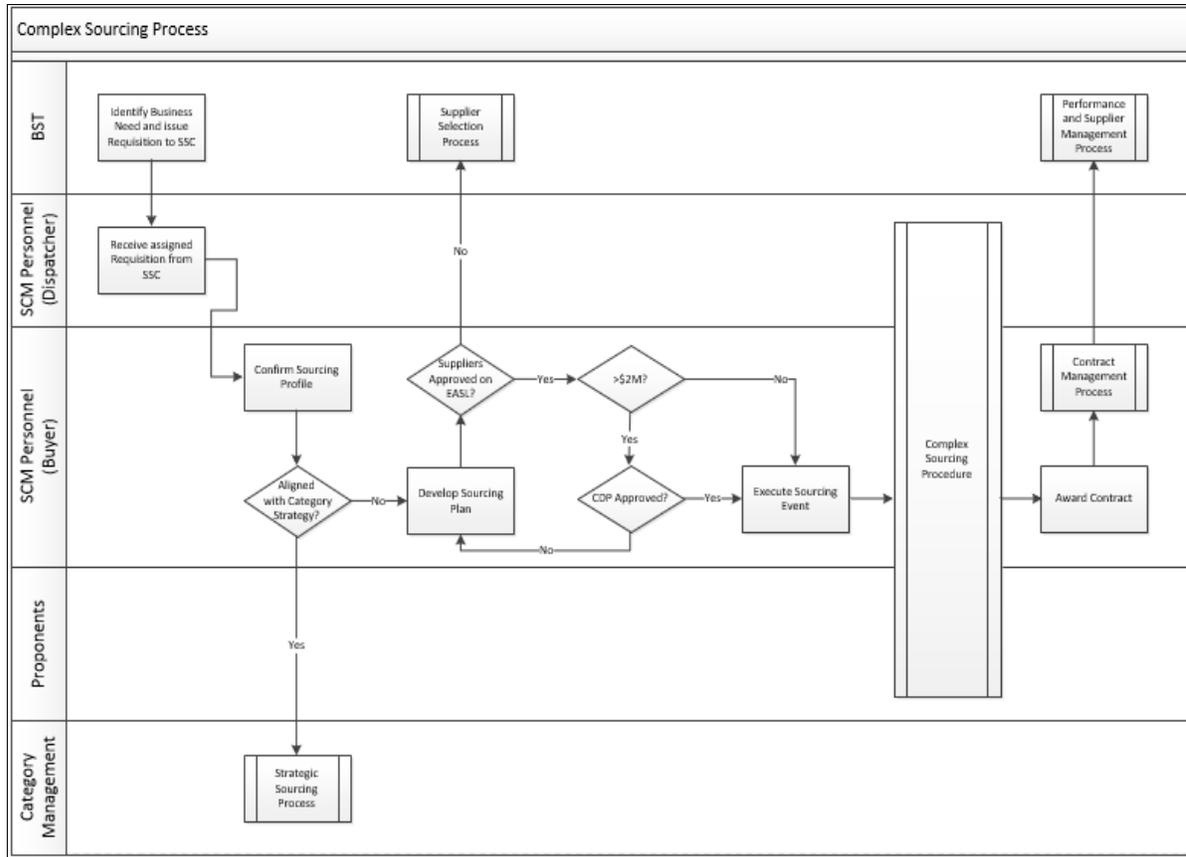

If the recommended strategy involves engaging the supply market through an RFx or direct negotiations, SCM Personnel will identify potential Suppliers to invite to the sourcing event as Proponents, and conduct the sourcing event as per the Level 4 Sourcing Procedure.

5.4 Award Contract

Following completion of the sourcing event, SCM Personnel will select the successful Proponent and complete a Contract Award Recommendation (CAR) to seek approval to execute the Contract(s) as per the Authorities and Spending Limit (ASL) Policy.

SCM Personnel should also debrief the unsuccessful Proponents, document sourcing value, develop and execute an implementation plan, enable solution in the ERP system, and ensure compliance with the Contract Management Program, processes and procedures.

1.0 Purpose

The purpose of this procedure is to identify, define and describe the major concepts for consistent and effective sourcing of Goods and Services.

2.0 Scope

This procedure outlines the sourcing requirements for the acquisition of Goods and Services which include: Transactional Sourcing, Complex Sourcing & the Management of Categories.

3.0 Definitions & Acronyms

Any capitalized terms or acronyms that are not defined below, shall have the same meaning in accordance with the Standards & Requirements stated herein.

Definitions	
Approved Supplier List	The Approved Supplier List contains real-time, searchable and detailed information for approved Suppliers of goods and services used within Company.
Authorized Contract Template	A contract template that has been approved in accordance with the Contracts Policy.
Business Need	Goods, and/or services to be purchased from a Supplier as required by Company and/or its Business Unit(s). The technical business requirement(s) including the scope of work/specification, quantities, schedule, delivery location, etc.
Business Stakeholder Team	Reference Article 4.0 below.
Business Unit	Liquids Pipelines, Gas Transmission & Midstream, Gas Distribution and Storage and other units that may be created or changed from time to time.
Category Management Team	Reference Article 4.0 below.
Company	Enbridge Inc. and all of its wholly-owned subsidiaries and affiliates.
Complex Sourcing	This sourcing type applies to medium/high risk services where no existing approved Contract (e.g., Master Agreement managed by CM) is in place, and for materials where Level 2+ inspection is required.

Contemplated Contract Supplements	Any “purchase order”, “schedule”, “service request order”, “activation order”, “work release”, “statement of work”, “work order”, “service release order”, “request for services”, “order form”, “change order”, “confirmation”, or similar types of contract supplements issued under, and in the form contemplated by, an existing approved Contract.
Contract	An agreement between two or more entities and/or persons that contains rights and obligations of its parties that are enforceable under law – i.e., the agreement is “legally binding” – an Assurance Contract, a Preliminary Agreement, an RFX, and an Amendment. Contracts may be formed both by a verbal or written agreement, and under certain circumstances issuance by the Company of purchase orders and certain other Contemplated Contract Supplements.
Contract Award Letter	A letter that is issued to the successful Proponent of a sourcing event, notifying them of award of the Contract.
Contract Award Phase	One of the final stages of a sourcing event, where the Business Need is awarded to one or more Suppliers.
Contract Management Phase	The time period after the Contract Award Phase, where the Supplier is actively delivering on the product and/or service.
Contract Owner	Reference Article 4.0 below.
Contract Regret Letter	A letter that is issued to the unsuccessful Proponent(s) of a sourcing event, notifying them that Company has decided to award to another Proponent.
Contracts Policy	Reference Article 24.0 below.
Corporate Social Responsibility Policy	Reference Article 24.0 below.
Cross-Functional Team	Reference Article 4.0 below.
Diverse Supplier	A Supplier that is at least fifty-one percent (51%) owned, managed, and controlled by a diverse person or group with U.S. or Canadian citizenship, and certified by a nationally or regionally recognized third party

Fatal Flaws	A set of criteria that has been predetermined by the CFT during development of the CDP, which would be used as justification to automatically eliminate a Proponent from the evaluation process.
Management of Categories Process	This is a Category Management process to leverage consolidated spend and demand to develop and implement optimal strategic sourcing solutions at an enterprise or multi-Business Unit level.
Master Agreement	Any “Master Construction Agreement”, “Master Consulting Services Agreement”, “Master Engineering Services Agreement”, “Master Geological Assessment Services Agreement”, “Master Purchase Agreement”, and/or “Master Service Agreement”.
Order	An SCM generated commercial document that authorizes a purchase transaction with a Supplier and communicates to the Supplier the specifics of the Business Need and requirements associated with the purchase. When accepted by the Supplier, it becomes a legally binding contract. Includes Purchase Order (PO), Work Order (WO), Work Release Contract (WRC) and Service Request Order (SRO) or other Contemplated Contract Supplements.
Preferred Suppliers	Supplier(s) selected from a strategic sourcing Management of Category Process for a particular category. Typically issued as Master Agreements.
Proponent	A potential Supplier supplying a proposal to an RFx.
Proponent’s Conference	A conference for companies invited to respond to an RFx to share information in advance of their submitting proposals (often in person).
Requestor	The person within Company and/or a Company Business Unit that has a Business Need.
Requisition	The document specifying the Business Need.
SCM Governance Team	Reference Article 4.0 below.
SCM Lead	Reference Article 4.0 below.
SCM Personnel	Reference Article 4.0 below.
SCM Records	Key documents from a SCM Process or Procedure.

SCM Tool(s)	Approved technology used to facilitate part or all of a SCM process. May be required technology, if identified as such in the associated procedure.
Single Source	When a purchase decision indicates that 100% of a Business Need is to be awarded to only one Supplier.
Sole Source	Any contract entered into without a competitive process, based on a justification that only one known source exists.
Strategic Category Plan	The documented, reviewed and maintained plan that establishes priorities for the Category Management Team, and lists key strategic sourcing and supplier relationship management initiatives for the planning period.
Supplier	A third-party organization that provides the Business Need to Company. Includes manufacturers, distributors, contractors, consultants, engineering firms, professional service providers, etc.
Total Cost of Ownership	Recognizing that price is only one element of value and cost, SCM evaluates all direct and indirect costs when making a purchase decision to determine best value over the lifecycle of the Business Need.
Transactional Sourcing	This sourcing type typically includes spot buys, three bids and a buy, and one-time purchases < \$250K. This specifically excludes Business Needs that are considered Complex (as per the definition above), and/or Business Needs that are sourced utilizing Contemplated Contract Supplements issued under, and in the form contemplated by, an existing approved Contract.
Acronyms	
ACT	Authorized Contract Template
AFE	Authorization for Expenditure
ASL	Authorities & Spending Limits
BST	Business Stakeholder Team
CAR	Contract Award Recommendation
CDP	Contract Development Plan
CFT	Cross-Functional Team

4.0 Roles & Responsibilities

Contract Owner

An employee (FTE and/or CWR) of the Company representing (i) the relevant Company group managed under a Company Business Unit, or (ii) the Company functional department, that proposes a Contract to which the Company will be a party to.

Business Stakeholder Team

Identifies and provides the Business Need. Provides input into the major steps of the process. Drafts the requisition.

Category Management Team

Responsible for the strategy and relationship management of Master Agreements. They may be engaged for clarity of terms and conditions or claims resolution as required.

Cross-Functional Team

A group of people with different functional expertise working towards a common set of goals and objectives and includes employees (FTE and/or CWR) from varying levels of the organization. The SCM Lead (or SCM designee) and the Business Stakeholder Team make up the sourcing initiative CFT.

Proponent/Supplier

Drafts a proposal for the Business Need identified in and conforming with the RFx. Supply the Business Need to Company, in conformance with the contract. Provides Supplier information, as required.

SCM Governance Team

Responsible to deliver clear direction, methodology, standards, processes, support and assessments to the SCM organization with regards to sourcing.

SCM Lead (if applicable)

Responsible for providing overall direction and support for the development and administration of the Contract and is ultimately accountable for the effectiveness and efficiency of the Contract administration.

SCM Personnel

The assigned resource that is responsible for leading the sourcing initiative.

5.0 Safeguarding Documents

- 5.1 SCM is responsible for securing and managing SCM Records.
- 5.2 All SCM Records, as well as any other pertinent information for reporting and auditing purposes, must be kept in accordance with the Records Management Policy and applicable statutes, regulations, policies, standards, and procedures.
- 5.3 All SCM Records must be secured in the designated SCM Tools and/or repository(ies) identified in the respective procedure(s).
- 5.4 All SCM Records created or received in the course of Company business activities is the property of the Company.
- 5.5 SCM Records are not required to be kept in hard copy, so long as SCM Records are stored within a designated SCM Tool and/or repository.
- 5.6 SCM Records include the following:
 - 5.6.1 A copy of the Requisition and/or bill of materials;
 - 5.6.2 A copy of the RFx;
 - 5.6.3 If required, evidence that all required approvals and/or authorizations were obtained;
 - 5.6.4 Copies of all sourcing documents used to qualify and select the Supplier;
 - 5.6.5 Where the Business Need was single sourced, documented single source justification is completed and signed;
 - 5.6.6 Copies of all sourcing documents, as applicable;
 - 5.6.7 Copies of all successful and unsuccessful responses, submissions and proposals received in response to procurement documents, and other attached forms;
 - 5.6.8 Exception form (if applicable);
 - 5.6.9 Information regarding any issues noted during the sourcing process;
 - 5.6.10 Information regarding all evaluations of submissions and proposals received in response to sourcing documents;
 - 5.6.11 Information regarding all Supplier debriefings including written documentation;
 - 5.6.12 Copies of all letters, notices, and posted announcements;
 - 5.6.13 Copies of the Contract(s), as well as any amendments and schedules to the Contract(s);
 - 5.6.14 Information regarding changes to Contract price prior to the issuance of the Contract;
 - 5.6.15 Risk assessment information and recommendations, where applicable;
 - 5.6.16 Contractor security screening decisions, where applicable;

- 5.6.17 Information regarding all protests, disputes or Supplier complaints regarding the sourcing including any Contract disputes;
- 5.6.18 Evidence of receipt of deliverables; and
- 5.6.19 Any other documentation as identified by the Company.

6.0 Contract Development Plan (CDP)

- 6.1 The Contract Development Plan (CDP) is a document developed by SCM that outlines a contracting strategy for a particular sourcing event, including the scope of work, commercial structure, list of Proponents, proposal evaluation criteria and any other pertinent details related to the strategy.
 - 6.1.1 For Master Agreements resulting from a Management of Categories Process indicating a Preferred Supplier(s) solution, a CDP is required when a supplier outside the Preferred Suppliers is added to the list of Proponents and the sourcing event results in one or more Contracts \geq \$2,000,000.
- 6.2 A CDP is required when a sourcing event results in one or more Contracts \geq \$2,000,000. Except in the following circumstances:
 - 6.2.1 A CDP is not required \geq \$2,000,000 if work is released against a priced Master Agreement, provided such releases are for work which a blanket CDP has been duly authorized.
 - 6.2.2 A CDP is not required \geq \$2,000,000 when there is an approved CDP resulting from a Management of Categories Process indicating that only one Preferred Supplier is approved and a Master Agreement is in place with that one Preferred Supplier.
 - 6.2.3 When an SSJ \geq \$2MM form has been approved at the applicable ASL level.
- 6.3 Each CDP shall include an analysis of appropriate commercial structures potentially applicable to the scope of work. A narrative analysis of advantages and disadvantages of using different commercial structures for the scope of work, and a recommendation regarding which commercial structure should be utilized for the scope of work. Some examples of commercial structures that may be considered for the analysis are listed below:
 - 6.3.1 lump sum;
 - 6.3.2 unit price;
 - 6.3.3 time & materials;
 - 6.3.4 actual cost-plus fixed fee;
 - 6.3.5 actual cost with target price (variable fee based on Contractor's actual costs being less or more than the target price); and
 - 6.3.6 guaranteed maximum price.
- 6.4 Proposal Evaluation Criteria:

- 6.4.1 Proposal evaluation criteria and associated weightings for the selection of the successful Proponent must be developed and agreed to by the CFT and documented, prior to proposal solicitation as part of the CDP. No changes are permitted to the proposal evaluation criteria and/or weightings once proposals have been received.
- 6.4.2 This evaluation criteria should also include any items that have been deemed as Fatal Flaws by the CFT prior to proposal solicitation.
- 6.4.3 Example bid tabulation templates based on the commercial agreement type (Lump Sum (LS), Time & Material (T&M), Unit Price Item (UPI)) with proposed criteria and respective weighting are available for reference on the SCM Governance SharePoint.
- 6.4.4 Led by SCM Personnel, the CFT will jointly develop a specific proposal evaluation scorecard to assess proposals. The proposal evaluation scorecard is divided into commercial, technical, CIE, and Sustainability and Supplier Diversity sections (when applicable). The CFT should examine the underlying business requirements to ensure alignment with the scoring criteria and breakdown percentages. This information should be documented in the CDP.
- 6.4.5 Upon approval of scoring criteria and weightings, this information may only be changed through a revision and formal approval of the CDP, and prior to receipt of the proposals.
- 6.5 **For Construction Contracts only:** If (a) each of the Proponents to which the RFx is being submitted has a currently effective MCA, and (b) the CDP recommends a commercial structure comprised of only 6.3.1, 6.3.2, 6.3.3, and/or 6.3.4, then such CDP shall include the following analysis of whether a MCA should be utilized:
 - 6.5.1 a narrative analysis of the advantages and disadvantages of using the existing MCA (newly negotiated ACT) for such RFx.
 - 6.5.2 a list of any terms and conditions in the Proponent's existing MCA(s) that differ from those set forth in the current MCA ACT.
- 6.6 The CDP must be endorsed by SCM Indigenous Engagement, and SCM Sustainability and Supplier Diversity. PACS Community Indigenous Engagement / Tribal Engagement endorsement is required for services only.
- 6.7 The CDP must be authorized by the BST according to the ASL and endorsed by the SCM Lead responsible for the sourcing process. Where a Vice President level or higher is responsible for authorizing a CDP, it must be endorsed by the SCM Director responsible for the sourcing process. Where a Senior Vice President level or higher is responsible for authorizing a CDP, it must be endorsed at the SCM Vice President level. All CDP's must include endorsements from the SCM Lead up to the responsible SCM signatory as outlined above. Please reference the ASL Approval Protocol for further information.
- 6.8 Changes to a CDP are to be communicated to the applicable stakeholders, and if said changes are material (e.g. scope, cost, schedule and/or Proponents list), a revision should be issued for the appropriate approvals.
- 6.9 RFx documents shall only be submitted after satisfaction of the requirements of this Article 6.0 in respect of CDPs, including the analysis set forth in Section 6.3 and the approvals required by Section 6.7.

Supply Chain Management**CATEGORY MANAGEMENT & SOURCING PROGRAM**

Version #: 4.0

Version Date: 2022-01-21

Sourcing Procedure

7.0 Community and Indigenous Engagement / Sustainability and Supplier Diversity

- 7.1 Community and Indigenous Engagement (CIE) and Sustainability and Supplier Diversity considerations must be included as business requirements within the Complex Sourcing and Management of Categories processes, including sourcing strategies, RFx documents, RFx evaluations, Contract documents, and implementation plans (if required). As a minimum requirement, at least one (1) Diverse Supplier must be included as a Proponent in every RFx in which competitive proposals are required under Article 9.0 below, unless the SCM Supplier Diversity team confirms that no qualified diverse Proponent is available. It is the responsibility of the applicable sourcing team to research and identify diverse Proponents for their RFx utilizing the Supplier.io Explorer site managed by the SCM Supplier Diversity team, and by directly contacting the SCM Supplier Diversity team for assistance when needed. Although CIE and Sustainability and Supplier Diversity considerations are not a requirement for the Transactional Sourcing process, contemplation and identification of potential opportunities are encouraged.
- 7.2 Complex Sourcing and Category Management must engage CIE and Sustainability and Supplier Diversity during the RFx development phase and prior to development of the CDP.
- 7.3 If a Business Need is Single Sourced and exceeds \$2,000,000, the implementation plan (if required) must include Community and Indigenous Engagement, and Sustainability and Supplier Diversity considerations.
- 7.4 All Contracts, without exception, must include the Supplier Code of Conduct ("Code"). All sourcing must include communication of the Code to prospective Suppliers. All sourcing must be compliant with Company's Environment, Social, and Governance (ESG) goals, Statement of Business Conduct, Climate Policy, Corporate Social Responsibility Policy, Diversity and Inclusion Policy, Indigenous Peoples Policy, and Supplier Diversity Policy.

8.0 Risk Management

- 8.1 The Company must consider, as appropriate, the use of Contract clauses that permit cancellation or termination at critical life-cycle stages.
- 8.2 All insurance requirements established by the Insurance Department must be met. This includes securing COI's prior to work commencing if applicable. At times, the business can accept less insurance based on the guidelines set forth by the Risk Department.
- 8.3 All Suppliers selected through a sourcing event must meet the onboarding requirements of the Supplier Management Program, which may include safety, sustainability, or other requirements.
- 8.3.1 If applicable, Proponents must be qualified and listed on the Approved Supplier List. For clarity, it is not a requirement for Proponents to be qualified and on the Approved Supplier List during the sourcing process, however the qualification must be completed prior to contract award. Consult with SCM Supplier Performance Management as required.
- 8.4 Lien or retainage holdbacks
- 8.4.1 Lien holdbacks are used to meet statutory requirements or can be imposed to meet Business Needs.

- 8.4.2 Lien and retainage holdbacks are required when contracting for construction related work and can be used to drive behavior in terms of meeting deliverables, expectations and timelines.
- 8.4.3 SCM and the Law Department must be consulted on a case by case basis to determine if the scope of work and deliverables requires a lien holdback.

9.0 Competitive Process and Proposal Solicitation Standards

9.1 Number of Proposals

The following outlines the thresholds and requirements which must be met for proposal solicitation unless a strategy exists with the SCM Category Management Team, where preferred Contracts or Master Agreements are specifically established as Single Source solution. **For clarity, utilizing executed Master Agreements does not permit SCM Personnel from forgoing the competitive process unless specifically noted in the approved CDP and CAR by SCM Category Management.** Proposal solicitations and/or transactions are not to be altered to circumvent proposal thresholds and requirements.

- 9.1.1 Where the SCM Category Management strategy is a competitive process among a set of Preferred Suppliers, proposals are to be solicited from the Preferred Suppliers only then issued as work released from their Master Agreement.

The following table outlines the thresholds and requirements which must be followed for proposal solicitation:

Estimated Contract Value	Comp Proposals Required	# of Proposals Solicited	# of Responses Required	Solicitation Method	Response Method	Proposal	SSJ < \$2MM Required	SSJ ≥ \$2MM Required	CDP Required	CAR Required
<\$250,000	No	1	1	RFP/RFQ	Written	Yes	No	No	No	No
≥\$250,000 & <\$2,000,000	Yes	≥2	2	RFP/RFQ	Written	Yes	Yes	No	No	No
≥\$2,000,000	Yes	≥3	2	RFP/RFQ	Written	Yes	No	Yes	Yes*	Yes

*Subject to Section 6.2

9.2 Request For Information:

The CFT may want to approach the market to pre-qualify potential Proponents and test acceptance of a proposed contract and labor strategy. For example, an RFI may indicate a plan to LS the contract but the majority of Proponents return the RFI indicating that they would only participate on a cost reimbursable basis. With this information the CFT may decide to revise the Contract Development Plan.

Please note that RFI's are not mandatory. This document should not be confused with the RFI document that is used for technical information requests during the post-award phase of the contract lifecycle.

9.3 RFX Development

9.3.1 A pro-forma Contract should be attached to all RFP and RFQ documents. In the event that a pro-forma Contract is not prepared, but the RFP schedule will be compromised, the RFP shall note that a pro-forma Contract will be provided via an addendum at a later date.

9.3.2 The information collected in the proposals will help plan a fair and cost-effective sourcing process, define the requirements, and identify qualified and/or interested potential Suppliers. For the solicitation of proposals, the templated RFX ACTs should be used when applicable.

9.3.3 RFX closing timelines must be reasonable to allow Proponents sufficient time to respond.

9.3.4 Law Department must approve RFX content when required per the Contracts Policy, prior to issue or when the RFX ACT is not used.

9.4 The Law, Tax, Credit, and Insurance Departments must review RFX documents when Non-ACT are proposed as the form of Contract to be used prior to issue. Additionally, representatives from the following disciplines may review RFX documents prior to its issuance: such as SCM, Corporate Social Responsibility, Indigenous Engagement, Public Affairs and Communications, Engineering, Construction, Safety, Project Controls, Risk Management, Quality, Environmental, Planning and Scheduling.

9.5 Communication During Sourcing Process, unless RFX documents state otherwise:

9.5.1 During the RFX process, all communication with Proponents in relation to the RFX, including but not limited to RFX questions and clarifications, must be coordinated through the SCM Personnel which shall be identified within the RFX documents.

9.5.2 RFX documents may be clarified through the use of an addendum response.

9.5.3 A question-and-answer response may also be used and does not require a modification to the RFX. All responses must be shared with all Proponents.

9.5.4 A Proponent's Conference may be held if information is best shared in person. If held, it should occur shortly after the RFX documents are issued. RFX documents must state whether attendance is mandatory. All Proponents must be treated fairly (information shared, number of attendees invited, etc.).

9.5.5 Evaluators may request additional information/clarification to support evaluations from the Proponents through SCM Personnel. All clarifications to proposals required by evaluators must be requested by the deadline provided by SCM Personnel.

9.6 RFX Documents may also include the following:

9.6.1 Description of the goods or services required in generic and/or functional terms specific to the Business Need, including scope quantities when available. When the use of non-generic and/or non-functional terms is appropriate, the specifications must deal with

performance requirements and exclude all features that could unfairly confer an advantage to certain Suppliers.

- 9.6.2 Evaluation criteria to be used in assessing submissions; must also identify those criteria that are considered mandatory and any technical standards that need to be met as set forth by the CFT. Evaluation criteria can be broadly described. The percentage of weighting between technical and commercial in the RFX must not be disclosed to the Proponents at any time.
- 9.6.3 The address, date, and timeline for RFX submissions. Submissions received after the closing date and time may be returned, unopened, depending on the RFX instructions.
- 9.6.4 The process, date, and timeline for the submission of questions/clarifications.
- 9.6.5 The submission rules, which may include format, language, inclusion of an executive summary, number of copies, attendance at a Proponent's Conference and any additional instructions to be followed in order to be considered a compliant proposal.
- 9.6.6 A request for a list of any applicable subcontractors.

10.0 Non-Competitive Process

- 10.1 A Single Sourcing Justification (SSJ) form **is required** in the following circumstances:
 - 10.1.1 To forego obtaining a competitive proposal where competitive proposals are required (Article 9.0 above), including time constraints to execute a competitive process.
 - 10.1.2 None of the circumstances outlined in section 10.2 below are applicable.
 - 10.1.3 Only one Supplier is able to meet the Business Need and it can be demonstrated that a second source cannot be developed (Sole Source).
 - 10.1.4 The Business Need includes matters of confidential or privileged nature and the disclosure of those matters through a competitive sourcing process could reasonably be expected to compromise confidentiality, cause economic disruption, or otherwise be contrary to the public interest.
 - 10.1.5 It can be demonstrated that the Business Need has transportation costs or technical considerations that impose geographic limits on the available supply base.
 - 10.1.6 An open sourcing process could interfere with the Company's ability to maintain security or order to protect human, animal, or plant life or health.
- 10.2 A Single Source Justification form **is not required** in the following circumstance:
 - 10.2.1 Where the estimated maximum (including contingency) contract value is < \$250k.
 - 10.2.2 When only one Preferred Supplier with a Master Agreement is approved through the Management of Categories Process supported with an approved CDP and CAR. The following circumstances are included:

- 10.2.2.1 Master Agreements managed at a program level and has been identified as a geographic area with supplier resource constraints (i.e. integrity digs).
- 10.2.2.2 Master Agreement for providing materials or parts to an install base (i.e. OEM).
- 10.2.2.3 Master Agreement for replacement of materials or parts in kind to an install base.

10.2.3 For work to be performed on property by a Supplier according to provisions of warranty or guarantee held in respect of the property or the original work.

10.2.4 In the event of an emergency. An emergency is defined as a risk to personnel and/or assets or where a disruption of construction or product delivery would be significant. In such cases, verification of the emergency must be provided in writing by the Director responsible for the budget within seventy-two (72) hours of the emergency being declared.

10.3 When a Business Need is Single Sourced and does not meet any of the above criteria, a Single Source Justification Form (SSJ < \$2MM or SSJ ≥\$2MM) must be authorized at the applicable ASL level. The form must indicate a business justification as to why a competitive sourcing process will be bypassed.

10.4 The Single Source Justification Form must be endorsed by SCM Indigenous Engagement, and SCM Sustainability and Supplier Diversity. PACS Community Indigenous Engagement / Tribal Engagement endorsement is required for services only. A Single Source justification does not dismiss the requirement for contemplation of opportunities for CIE and Sustainability and Supplier Diversity.

10.5 For any instances where a SSJ form is not required per section 10.2, SCM Personnel must document in the notes section of the PO that no competitive process was conducted and state the reason.

11.0 Less Frequent Sourcing Types

Insourcing, outsourcing, crowdsourcing, reverse auctions, and other less frequent sourcing types require a written business justification and written approval from the appropriate SCM ASL level and applicable sourcing process steps are still required.

12.0 Proposal Evaluation

12.1 Evaluation Team and Process

- 12.1.1 The proposal evaluation team will be decided, if required, by the CFT.
- 12.1.2 Evaluation team members may include SCM Personnel, subject matter experts, and representatives of the BST.
- 12.1.3 To ensure the integrity of the evaluation process, the individual evaluations must be conducted independently but can be reviewed as a team.
- 12.1.4 Pricing is to be evaluated by SCM Personnel as part of a TCO evaluation.
- 12.1.5 Any Contract language changes deviating from the SCM ACTs are to be evaluated by the Law Department.

- 12.1.6 Evaluations must be consolidated by SCM Personnel.
- 12.1.7 Technical, operational, and capability analysis are to be evaluated by the technical, operational, and capability experts on the CFT, or their delegate(s).
- 12.1.8 Community and Indigenous Engagement analysis are to be evaluated by the CIE experts or their delegate(s). Similarly,
- 12.1.9 Sustainability and supplier diversity analysis are to be evaluated by the Sustainability and Supplier Diversity experts or their delegate(s).
- 12.1.10 All documentation related to the evaluation process is subject to audit and therefore must be fair, consistent, and fully defensible.
- 12.1.11 Subject to the results of the scoring process, shortlisting may occur to one or more Proponents. Please reference Article 13.0 below for further details regarding shortlisting.
- 12.1.12 If the BST wishes to negotiate with multiple suppliers, this is acceptable provided that a complete true-up of the evaluation is conducted post-negotiation and identified in the CAR.
- 12.1.13 In the event that additional information is made available to the evaluation team after the initial scoring process has been completed, the evaluation team may reevaluate the shortlisted proposals, which may only result in rescoring of applicable sections in which the new information specifically affected.
- 12.1.14 If no proposals are acceptable and/or compliant and it is not reasonable to go through any other method, SCM may choose to negotiate directly with a specific supplier. A SCM Exception form must be filled out and approved.

12.2 Receipt of Proposals and Proposals Opening

- 12.2.1 Proposal opening (physical submission) shall be conducted by SCM Personnel to ensure that commercial information is not inadvertently shared with technical evaluation participants. Electronic submissions shall be directed to SCM Personnel who will distribute the technical information to the relevant technical evaluation participants.
- 12.2.2 SCM Personnel are to ensure that all expected proposals have been received and perform a cursory review to confirm if all RFx deliverables have also been received. SCM Personnel are to identify any items that may be missing from the proposals for further follow up with Proponent(s) as applicable.

12.3 Proposal Evaluation

- 12.3.1 The scorecard developed as part of Section 6.4 above will be independently evaluated by the commercial team (SCM Personnel with input from others as needed), a technical team made up of the BST (e.g. Project Management, Construction, Safety, Quality, Engineering, Projects Controls, Environmental, Project Manager etc.), the designated CIE team representative (CIE content/inclusion), and the Sustainability and Supplier Diversity team, when applicable.
- 12.3.2 All scoring will require appropriate detailed comments associated with each score as justification. Technical exceptions, assumptions and clarifications will be addressed by the technical evaluation team and included as part of the technical scoring submittal.

- 12.3.3 If Fatal Flaws have been identified by the CFT during the evaluation process, clarifications should be made to determine the Proponents intent prior to elimination from the process.
- 12.3.4 Upon completion of scoring, all proposal evaluation scorecards will be provided to SCM Personnel via email. This information is not to be shared with other evaluators and/or anyone else who is not considered to be a member of the CFT, as this information is considered to be highly confidential. SCM Personnel will combine the independent scoring into one combined score.
- 12.3.5 The CFT may also choose to score the proposals in unison through meetings and/or conference calls.
- 12.3.6 Commercial information will be shared with the CFT once all technical scoring has been received by SCM Personnel for compilation into the overall proposal evaluation scorecard. The overall proposal evaluation scorecard will then be shared with the CFT. A review meeting should be conducted to review the overall proposal evaluation scorecard and provide an opportunity for all members of the CFT to understand each score from the other evaluators' perspective.

13.0 Shortlisting and Final Negotiation Process

This article establishes the requirements to successfully execute and manage the shortlisting of Proponents' proposals (when required) in response to an RFP.

Furthermore, it defines the scope, criteria for shortlisting, suggested timelines, and roles and responsibilities of the respective individuals and teams involved during the process of shortlisting activities and must be captured within the approved CDP.

13.1 General

- 13.1.1 Shortlisting must be administered fairly, reasonably, and lawfully. Such conduct is in keeping with the Company's values of integrity and respect and enhances the relationship between the parties.
- 13.1.2 Timely administration of technical and contractual document reviews will facilitate the shortlisting process and approval while reducing ambiguity and subjectivity from the parties involved in the procedure.

13.2 Applicability

Shortlisting may be considered in the following circumstances:

- 13.2.1 On all construction RFPs where the estimated maximum (including contingency) Contract value is > \$10M;
- 13.2.2 On RFPs where the estimated maximum (including contingency) Contract value is >\$2M and the shortlisting process has been agreed to be followed by the CFT based on risk exposure;
- 13.2.3 Any exceptions to this Article 13.0 must be documented and approved through the Contract Development Plan outlined in Article 6.0 above.

13.3 Shortlist Proponents

Upon proposal evaluation score review and further discussions amongst the evaluation team, a recommended shortlist of Proponents may be established taking into consideration the following criteria:

- Technical scoring;
- Overall proposal price;
- Socio-economic scoring (Community and Indigenous engagement)
- Sustainability and supplier diversity scoring and associated sustainability risks
- Detailed review of technical exceptions and associated risks;
- Detailed review of commercial terms and conditions exceptions and associated risks,
- Percentage of subcontracted work, including CIE and Sustainability and Supplier Diversity (if applicable);
- Any analysis prepared in reviewing cost breakdown of extra work items.

13.4 Negotiating with Shortlist Proponent(s)

- 13.4.1 Once a short list of Proponents has been developed, the CFT will jointly evaluate the proposals to identify each Proponent's understanding of the scope of work and other areas where pricing anomalies may be present. A comparative analysis of the proposals will be performed as well as a check against historical pricing information and any available market intelligence data where applicable.
- 13.4.2 Upon completion of the evaluation of the revised shortlisted Proponents' proposals, the proposal evaluation team will meet to finalize the negotiation strategies, including identifying participants and roles for negotiation meetings with each shortlisted Proponent.
- 13.4.3 Negotiation meetings will be set with shortlisted Proponents to discuss areas where there appear to be scope comprehension and/or pricing discrepancies. Pricing for the work and any extra work items will be discussed. Additionally, any outstanding commercial and technical clarifications will be discussed and resolved. Proponents may be invited to make a presentation to further clarify their revised proposals.
- 13.4.4 Once all technical and commercial clarifications are completed, and the CFT is satisfied that the best value Proponent has been identified, the evaluation team will make an award recommendation as per Article 15.0 below.

14.0 Financial Stability Review

- 14.1 FSR is required by Corporate Credit, prior to Contract award, when circumstances exist that could result in significant risk to the Company should a Supplier become insolvent or unable to deliver the contracted scope of work in a timely manner, as described below, SCM will complete the FSR request form with no more than three (3) final pre-selected Suppliers per contract and send it to Corporate Credit along with a full set of the most recent audited or accountant-prepared year-end financial statements, including the balance sheet, income statement, statement of cash flows and notes to financial statements, and the most recent year-to-date financial statements of Suppliers.

- 14.1.1 The estimated contract value is > \$30,000,000; OR
- 14.1.2 Contracts that at any time may require Company to prepay a lump-sum of \$3,000,000 or more (i.e. mobilization fees); OR
- 14.1.3 The estimate contract value is > \$20,000,000 AND
 - Schedule compliance is critical to the timely completion of the overall project;
 - Significant liquidated damages could be incurred;
 - Significant warranty exposure exists;
 - Supplier's prior performance has not met the Company's performance standard;
 - Additional capital investment is required by the Supplier in supporting the Contract (i.e. purchase of intellectual property);
 - SCM is of the opinion that a Supplier Financial Stability Review is warranted
- 14.1.4 Corporate Credit's determination of whether a Supplier is financially stable or not is only specific to the Contract described in the form. Any new Contracts with the same Supplier requires a new request.
- 14.1.5 Corporate Credit will provide a report back to SCM, generally within seven (7) business days. These time frames are per Supplier, strictly used as a guideline only, and if there are extenuating circumstances (i.e. Supplier requires a Confidentiality Agreement or incomplete information on the Financial Stability Review Form, then these time frames may be longer).
- 14.1.6 If Corporate Credit either:
 - Has been unable to determine if the Supplier is financially stable due to the lack of financial information being provided; or
 - Has determined that the Supplier is not financially stable, and a decision is made to proceed with an award to the Supplier, an exception must be approved per the SCM Exception Form and forwarded to the emails below; including the VP of Enterprise Risk.
- 14.2 Fill out the Financial Stability Review Request for each of the intended Proponents and email to EGICredit@enbridge.com for Supplier agreements related to Enbridge Gas Inc. or to creditdept@enbridge.com for all other business units.

15.0 Contract Award Recommendation (CAR)

- 15.1 For all Contracts \geq \$2,000,000, a Contract Award Recommendation (CAR) form is required (where competitive proposals have been solicited).
- 15.2 If a recommendation is made to award the Contract to other than the highest scoring Proponent, the following must be adhered to:
 - 15.2.1 In the specific situation where a sourcing steering committee has been formed as part of the sourcing strategy, and the recommendation is made to award the Contract to other than

the highest scoring Proponent, the business justification for the recommendation must be documented in the CAR.

- 15.2.2 In the situation where the BST does not agree with the recommendation to award the Contract to the highest scoring Proponent, they must obtain written approval (in either hard-copy or electronic form) from a member of their ELT to select an alternate supplier and attach the approval to the CAR, unless the difference in the overall score between the highest scoring Proponent and the alternate Proponent is less than 3%.
- 15.3 The CAR must be endorsed by SCM Indigenous Engagement, and SCM Sustainability and Supplier Diversity. PACS Community Indigenous Engagement / Tribal Engagement endorsement is required for services only.
- 15.4 The CAR must be authorized as per the ASL by the BST.
- 15.5 The authorized CAR must be retained in the SCM contract file in the CMS.
- 15.6 A CAR must be authorized prior to notifying the successful Proponent.
- 15.7 A Contract Award Letter may be issued to the successful Proponent advising that they have been awarded the scope of work and execution of the Contract will be forthcoming.
 - 15.7.1 If applicable, the successful Proponent must be qualified and listed on the Approved Supplier List prior to notifying the successful Proponent or issuing a Contract Award Letter. For clarity, it is not a requirement for Proponents to be qualified and on the Approved Supplier List during the sourcing process, however the qualification must be completed prior to contract award.
- 15.8 A Contract Award Letter must include a statement advising the successful Proponent that work is not to commence until the Contract has been fully executed.
- 15.9 A Contract Regret Letter may be issued to the unsuccessful Proponent(s) and is retained in the SCM file and CMS. The Contract Regret Letter(s) will be issued after the successful Proponent has been notified.
- 15.10 **A CAR is not required for the following:**
 - 15.10.1 When a SSJ \geq \$2MM form has been approved at the applicable ASL level;
 - 15.10.2 When a Business Need is being awarded to a MSA holder where the priced Master Agreement was competitively sourced with the intent to release Single-Sourced Contemplated Contract Supplements against and was documented as such in an approved CDP and CAR. Refer to sub-section 6.2.2 and 10.2.2 above.
- 15.11 In the event that a Contract is awarded and then cancelled due to extensive delays, a re-engagement activity should be performed prior to re-awarding the Contract to the same Supplier. This re-engagement activity would be satisfied with a business justification included as part of a revised CAR, which should be re-approved.
- 15.12 At a minimum, the following documents should be attached with the CAR when forwarding for signatures:
 - 15.12.1 Authorized CDP;

- 15.12.2 Proposal evaluation summary (commercial & technical evaluation bid tabulation); and
- 15.12.3 Supporting documentation demonstrating functional approval for terms and conditions

16.0 Letters of Intent

- 16.1 Letters of Intent (LOI) are to be used with extreme care and only in cases where not issuing the LOI would compromise schedule.
- 16.2 LOI's are Non-ACTs that must be approved by the Law Department and the applicable parties identified in the Contracts Policy.
- 16.3 LOI's are to be used only when there are no unresolved exceptions noted by the potential Supplier as part of a sourcing event.
- 16.4 LOI's may not be used if they place SCM at a disadvantage in negotiating sound business arrangements or where termination would result in delays.

17.0 Limited Authorization to Proceed

- 17.1 Limited Authorization to Proceed (LATP) are Non-ACTs that must be reviewed by the Law Department prior to execution.
- 17.2 An LATP can be used to allow a Supplier to start work, in accordance with the RFx documents, prior to Contract execution, provided prior written approval from the BST has been obtained. Terms and conditions must be fully agreed to prior to executing a LATP.
- 17.3 LATP's must include the following minimum criteria:
 - 17.3.1 The applicable RFx documents.
 - 17.3.2 The limited scope of work that the Company is approving.
 - 17.3.3 A "not to exceed" value associated with the limited scope of work.
 - 17.3.4 Compensation for the work will be in accordance with the RFx documents and the Supplier's proposal; and therefore, the LATP will form part of the executed Contract.
 - 17.3.5 A short validity period.
 - 17.3.6 LATP must be authorized per the ASL by the BST.

18.0 Contract Development

- 18.1 All Contracts must comply with the Contracts Policy.
- 18.2 Contracts must be in place (preliminary agreement – limited authorization to proceed is a contract) prior to commencing work or receiving goods.

Supply Chain Management

CATEGORY MANAGEMENT & SOURCING PROGRAM

Version #: 4.0

Version Date: 2022-01-21

Sourcing Procedure

- 18.3 Evergreen Contracts (Contracts without an expiration date) must be avoided. A competitive process is to be performed every 2 to 5 years.
- 18.4 When contracting internationally, factors such as legal, the Corporate Social Responsibility Policy, logistics, and other considerations must be evaluated early on to identify unique requirements and minimize risk.
- 18.5 The approved CMS must be used for storing executed Contracts.
- 18.6 Contracts must be developed using an ACT or a grandfathered template. If there is uncertainty as to the appropriate form of Contract, the Law Department should be consulted.
- 18.7 The Law Department must approve any alternate legal terms or conditions, including language added to, deleted from, or changed within the general conditions of an ACT or grandfathered template, unless the clauses have been pre-approved in the alternate clause library.

19.0 Executing Contracts

- 19.1 A Contract should be executed by the Supplier before it is executed by Company.
- 19.2 Contracts must be approved per the Contracts Policy and authorized per the ASL.

20.0 Sourcing Process Completion and Debriefing

- 20.1 Following the completion of a Contract a debrief for unsuccessful Proponents is permitted; however not necessary. Providing Proponents feedback upon request is not recommended without the Law Department consultation.

Following the completion of a Contract, communication should be sent to applicable internal stakeholders clarifying their respective roles in helping Company fulfill its Contract obligations and assist with any change management as a result of the award. An implementation plan may be required for significant changes and de-commissioning of current Suppliers who perform the work

21.0 Turnover to Contract Administration

Once a contract is executed and ready to be handed over to the contract administration team the Contract Turnover Checklist should be completed.

22.0 Exceptions

SCM Personnel are required to report, and have approved, any exceptions to this Sourcing Procedure. Exceptions are to be documented on the SCM Exception Form and approved in writing.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Federation of Rental-housing Providers of Ontario (FRPO)

Interrogatory

Reference:

Ex. 4, Tab 4, Schedule 3, Attachments 7, 8 & 9

Preamble:

The referenced attachments state Enbridge corporate policies regarding, among other things, contracting for pipeline contractors. We would like to understand better EGI's approach to engaging pipeline contractors in major projects and how ratepayers' interests are protected.

Question(s):

In tabular form, for each ICM project during the most recent ICM projects, please indicate the name of the project, the total cost of the project, the cost of pipeline contractor services and whether EGI produced an RFP for the retention of the pipeline contractor.

- a) Please provide any analysis or study that EGI has done to assess the value for money of the contractor services.
- b) What incentives does the contractor and the company have to minimize the cost of a major ICM-type project? Please describe fully.

Response:

Please see Table 1 and note that project spend is inclusive of overheads as at December 31, 2022. Costs include total project spend.

Table 1
ICM Project Spend in \$

ICM Project Name	Total Project Spend	Contractor Cost	RFP Completed
Stratford Reinforcement Project	25,002,541	15,097,785	No*
Kingsville Transmission Reinforcement Project	91,553,885	43,402,806	Yes
Windsor Line Replacement Project	83,123,644	40,789,488	Yes
London Lines Replacement Project	122,270,345	70,726,847	No*
Don River 30" Pipeline Project	31,013,254	16,179,301	No*
Cherry to Bathurst	87,698,894	56,981,669	No*

* RFP not required as projects were awarded through the master agreement.

- a) Enbridge Gas completes Request For Proposals (RFP) which allows the Company to analyze the market rate for various pipeline contractors. As a result of previous RFP, Enbridge Gas entered into master agreements with 2 Alliance Partner contractors for the execution of distribution construction work. ICM projects executed under the master agreement for distribution construction are assigned to each Alliance Partner based on geographic regions. For all other ICM projects, RFPs are performed to select a contractor for the work.
- b) For ICM projects executed under the master agreements for distribution construction work, the contractors are incented to minimize the cost of a project through the financial framework within the agreement. Each contractor has agreed to an established profit margin for the overall portfolio of work with Enbridge Gas under the contract. There are mechanisms to address over earnings and under earnings. The contractor is also incented to introduce productivity savings into their work under the terms of the agreement.

For all other ICM projects, competitive bids are performed to select the most appropriate contractor to perform the work. The contractors are incented to incorporate factors including safety, productivity, and efficiency into their submission to secure the contract.

Also, please see response at Exhibit I.2.6-FRPO-39 part b).

Question(s):

Please update Table 1 to reflect actual data for 2022 and the updates contained in the January 27, 2023 letter.

Response:

Please see response at Exhibit I.1.1-SEC-74 part g), Attachment 1, Table 1.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Greenhouse Vegetable Growers (OGVG)

Interrogatory

Reference:

Exhibit 4 Tab 4 Schedule 3 Plus Attachments Page 3 Table 1
Exhibit 4 Tab 4 Schedule 3 Plus Attachments Page 8 Table 2

Question(s):

EGI provides the FTEs related to CFs from 2018 to 2024 in Table 1.

Costs for employees that are part of CFs have been excluded from EGI compensation amounts starting in 2018 following the Enbridge Spectra merger as costs are allocated through the Central Function Cost Allocation Methodology.

- a) Please update Tables 1 and 2 to reflect actuals to the end of 2022.
- b) Please provide the compensation amounts (broken out between Salaries/Wages and Total Benefits/Incentive Pay) associated with employees that are part of CFs for the years 2018 to 2024, with the data updated to reflect actuals to the end of 2022.

Response:

- a) Please see response at Exhibit I.1.1-SEC-74 part h), Attachment 2.
- b) Please see response at Exhibit I.4.4-STAFF-139.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Greenhouse Vegetable Growers (OGVG)

Interrogatory

Reference:

Exhibit 4 Tab 5 Schedule 1 Attachment 2 Page 8 of 8

Question(s):

- a) Please confirm that the “current rates” cost of \$752.5M is based on the two distinctly different depreciation methodologies and procedures for each of the legacy Union and EGD rate zones as described at Exhibit 4 Tab 5 Schedule 1 Page 5 Table 2; if not confirmed, please explain the basis for the “current rates” calculation. Please comment on whether the “current rates” scenario could be used by EGI going forward.
- b) Relative to the claimed depreciation expense of \$921.4M based on the use of Equal Life Groups (ELG), please calculate the equivalent depreciation expense for 2024 assuming, all else remaining the same, the use of Average Life Groups (ALG) instead; in providing the calculation please update the claimed depreciation expense under both scenarios to reflect updates and corrections in the application to date.
- c) Please extend the forecast of depreciation expense under both the ALG scenario and the proposed ELG scenario (both as updated) over the 5 years of EGI’s proposed IRM term, assuming the 2024 to 2028 proposed capital spending as set out in Exhibit 2 Tab 6 Schedule 1 Page 36 (as updated).

	2024	2025	2026	2027	2028
ALG					
ELG	921.4M				

- d) Please confirm that the use of ALGs remains acceptable for EGI even though EGI prefers ELGs; if not confirmed please explain why EGI cannot use ALGs as the basis for its depreciation expense.
- e) If the test year depreciation expense were set based on Average Life Groups with a (OGVG assumes) corresponding reduction in EGI’s materiality threshold during the

proposed IRM period, how would EGI’s forecast need for access to ICM relief change in the 2025 to 2028 period?

Response:

- a) Confirmed, the ‘current rates’ cost is based on two different depreciation methodologies and procedures. Note that the current cost provision was revised to \$771.6 million, please see Exhibit 4, Tab 5, Schedule 1, Attachment 2, updated March 8, 2023. Enbridge Gas does not believe it would be appropriate to use the ‘current rates’ scenario going forward for several reasons. First, the current rates were derived from depreciation studies conducted in 2011 and are not updated to current expectations for asset useful lives. Second, the current rates are not appropriate to apply with the proposed harmonization initiatives including asset accounts and net salvage approach. Finally, it is not appropriate for Enbridge Gas, as an integrated utility, to maintain regional differences in depreciation approaches and methodologies, nor would this be aligned with the overall activities of the Company to harmonize planning and processes.
- b) Please see Exhibit I.4.5-IGUA-25, Attachment 4. /u
- c) Please see Table 1 for a comparison of the 2024 to 2026 depreciation expense using the ALG and ELG methods. Note that the depreciation expense for 2024 using the ELG method has been revised to \$892.4 million, please see Exhibit 4, Tab 5, Schedule 1, Attachment 2, updated March 8, 2023. Both the ELG and ALG estimates for 2025 and 2026 do not reflect the corrections from March 8, 2023 and are overstated by approximately \$30 million each year, respectively. Enbridge Gas is unable to provide the forecast for the 2027 to 2028 period as this is beyond the forecast period used for budgeting purposes.

Table 1
Depreciation Method Comparison

Depreciation Method (\$ millions)	2024	2025	2026
ALG	810.7	856.6	905.6
ELG	892.4	961.5	1,014.8

- d) The following response was provided by Concentric Energy Advisors, Inc.:

Concentric recommends the use of ELG procedure, (which is similar to the currently approved Generation Arrangement for legacy Union system), for Enbridge Gas as it better matches the consumed life of the assets in service with the depreciation expense accrued. For further explanation of the benefits of ELG, please see

response at Exhibit I.4.5-STAFF-173. However Concentric notes that the ALG procedure is widely used and accepted throughout North America.

- e) Enbridge Gas's forecasted ICM threshold would decrease if the test year depreciation expense were set based on ALG methodology. As provided at Exhibit I.2.6-STAFF-71, Enbridge Gas would assess and may seek ICM recovery of significant projects that meet the ICM eligibility criteria of need, materiality and prudence, to the extent that there is a change in ICM threshold or a change in capital forecast.

Answer to Interrogatory from
School Energy Coalition (SEC)

Interrogatory

Reference:

4-4-1, pp. 3 & 7

Question(s):

Enbridge states that COVID-19 had a substantial influence on the Company's operations and costs during 2019-2021, and beyond. COVID-19 restrictions led to a reduction in work volume from access limitations and staff availability creating a backlog that will need to be addressed as the company returns to normal operating conditions in 2022, and notes that from 2022 to 2024, there are cost pressures expected from the impacts of COVID-19:

- a) Please provide details of all costs included in the 2024 forecast which are specifically attributable to COVID-19, broken down by driver.
- b) When does Enbridge expect the backlog of work related to deferred work, due to COVID, will be caught up?

Response:

a-b) Please see response at Exhibit I.4.4-CCC-83.

School Energy Coalition (SEC)

Interrogatory

Reference:

4-4-1, p. 57 and 4-4-2, p. 49

Question(s):

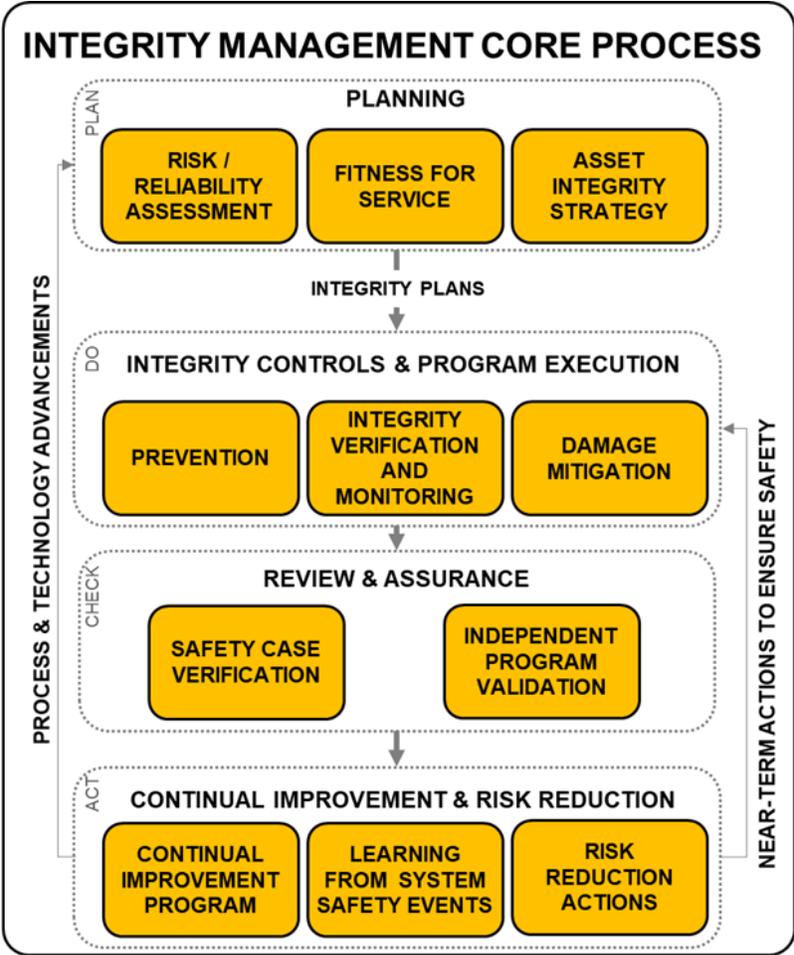

Please provide further details on what the Integrity Management Program entails and the Integrity Management Framework Standard entails and the associated costs.

Response:

The maintenance strategies currently employed for transmission and distribution pipelines, are provided in the Asset Management Plan at Exhibit 2, Tab 6, Schedule 2, Section 5.2.3.2, page 82, Pipe Condition and Strategy Overview. Section 5.2.3.6.1, page 107, provides further details on Transmission Integrity. Section 5.2.4.2 page 125 provides additional information on Facilities Integrity Management

Enbridge Gas's core goal is to ensure the safety of the public and its employees and the safety and reliability of our assets. Therefore, ensuring that Enbridge Gas's integrity management programs are based on industry best practices and incident learnings becomes a key element of that goal. The Enbridge Integrity Management Framework Standard (IMFS) is an enterprise-wide minimum standard in the field of safety and reliability, specifically for asset integrity management programs. Currently, this standard and its requirements only apply to Transmission Integrity Management Program (TIMP) assets; however, the plan is to bring Storage Downhole (SDIMP) and Facilities (FIMP) assets into scope. This standard is based upon the following integrity management core process, which is common across Enbridge Gas's different business units as illustrated in Figure 1.

Figure 1: Integrity Management Core Process

Please see response at Exhibit I-4.4-STAFF-125 for the Integrity Management Program and IMFS associated costs within the Engineering & STO department. These costs are attributed to full program costs including salaries & wages, contract services, and other O&M.

Question(s):

Utility Operating & Maintenance (O&M) is forecasted as follows and includes integration costs and savings and productivity savings:

\$M	2019A	2020A	2021A	2022F	2023F	2024F
Utility O&M Exhibit 4-1-1 Table 2	914.6	948.4	920.6	963.8	969.7	991.7
Increase in DSM as a result of EB-2021- 0002					25.24	26.2
Increase in Pensions in update					?	28.9
Updated Total	914.6	948.4	920.6	963.8	994.9	1046.8
Increase year over year		3.7%	(2.9%)	4.7%	3.2%	5.2%
Included in the above numbers are the following costs/savings						
Integration- Related Costs Attachment 2				15.7	19.5	0
Integration Savings Ex 4-4- 2 Table 2	(32.3)	(52.4)	71.2	(85.8)	(86)	(86)
Productivity Savings Ex 4-4- 2 Table 2	(8.2)	(18.6)	(18.6)	(17.7)	(31)	(35.2)

- a) Please correct any errors in the above table, if there are any.
- b) Please provide the change in pension and OPEB for 2023 based on the latest evaluation from Mercer Canada Limited discussed in the January 27, 2023, update letter.

- c) The Decision and Order for EB-2021-0002 issued on November 15, 2022, states that 'A total budget of \$167.24 million is approved for 2023. This amount is to be increased each subsequent year of the DSM plan by the annual rate of inflation and an additional 3% for all program related costs.' Based on the current forecast for 2023, the increase is (\$167.24M-\$142M = \$25.24M). How was the increase of \$26.2 determined for 2024?
- d) Please provide an update of available actual O&M spending, integration costs and savings and productivity savings in 2022, broken out as per Table 12. (Note: please make best efforts to provide the most current actual numbers for 2022, understanding that they will be unaudited)
- e) If 2022 actuals are materially different than that forecasted, please update the 2023 and 2024 forecasts as required.

Response:

- a) Please see Table 1, reflecting data provided at Exhibit 4, Tab 4, Schedule 2, updated on March 8, 2023 (including impacts of unregulated storage allocations).

Please note that integration-related costs values in Exhibit 4, Tab 4, Schedule 2, Attachment 2 represent year over year changes. Table 1 reflects the annual integration-related costs from Exhibit 4, Tab 4, Schedule 2, Table 10.

Table 1

\$M	2019A	2020A	2021A	2022F	2023F	2024F
Utility O&M Exhibit 4-1-1 Table 2	914.6	948.4	920.6	963.8	969.7	991.7
Increase in DSM as a result of EB-2021-0002					24.9	26.2
Increase in Pensions in update					27.2	28.0
Updated Total	914.6	948.4	920.6	963.8	1,021.7	1,046.0
Increase year over year		3.7%	(2.9%)	4.7%	6.0%	2.4%
Included in the above numbers are the following costs/savings						
Integration-Related Costs Attachment 2	51.7	124.0	49.8	35.2	19.5	
Integration Savings Ex 4-4-2 Table 2	(32.3)	(52.4)	(71.2)	(85.8)	(86)	(86)
Productivity Savings Ex 4-4-2 Table 2	(8.2)	(18.6)	(18.6)	(17.6)	(31)	(35.2)

- b) The change is an increase of \$27.6 million (or \$27.2 million net of unregulated storage allocations).
- c) The increase of \$26.2 million is the difference between the 2024 DSM Plan budget of \$148.8 million proposed by Enbridge Gas¹ and the 2024 DSM Plan budget of \$175 million approved by the OEB². Note: The DSM budget amounts in 2024 were estimated using a 2% inflation rate. The actual 2024 DSM budget based on a CPI inflation factor as was approved by the OEB in EB-2021-0002, is yet to be determined and included in the 2024 budget.
- d) Please see response at Exhibit I.1.1-SEC-74 part g).
- e) 2022 actuals will not result in 2023 and 2024 forecast updates.

¹ EB-2021-0002, Exhibit D, Tab 1, Schedule 1, p.12.

² EB-2021-0002, Decision and Order, November 15, 2022, Schedule A, p.i.

ENBRIDGE GAS INC.

Answer to Interrogatory from
School Energy Coalition (SEC)

Interrogatory

Reference:

4-4-2, p. 13, Table 3

Question(s):

Enbridge states that BD&R costs in 2024 include costs recovered in deferral accounts in 2023 and earlier in the amount of \$7.1M:

- a) Provide further details of what costs the \$7.1M represent, i.e., which deferral accounts and in which years were these costs previously charged to.
- b) Provide a breakdown of all costs included in Table 3 related to this application.
- c) Please provide further details about what is included in sponsorships and memberships costs.

Response:

As noted in response at Exhibit I.4.4-STAFF-117, the reference to costs recovered in deferral accounts in 2023 and earlier should be \$6.8 million, instead of \$7.1 million and the reference of OEB costs previously recovered through the OEBCAVA should have been \$3.6 million instead of \$3.9 million. Enbridge Gas has also provided further clarification on the variance explanation of BD&R cost in the 2024 Test Year versus the 2023 Bridge Year in response at Exhibit I.4.4-STAFF-117.

- a) The \$6.8 million represents 2024 Forecast costs that would previously have been recovered through the following three deferral accounts:
 - \$1.8 million for IRP Operating Costs Deferral Account (IRPOCDA);
 - \$1.4 million for GHG Emissions Administration Deferral Account (GHGEADA);
 - and
 - \$3.6 million for OEB Cost Assessment Variance Account (OEBCAVA).

Table 1 shows the amounts expensed each year that went to the deferral accounts for annual recovery. Please note the 2022 Forecast has been included as amounts are not yet finalized until submitted for recovery.

Table 1

Line No.	Deferral Account (\$millions)	2019 (a)	2020 (b)	2021 (c)	2022 (d)
1	GHGEADA	1.6	2.4	3.8	5.2
2	IRPOCDA	-	-	0.0	1.2
3	OEBCAVA	4.3	4.2	2.6	4.4

- b) BD&R costs related to OEB proceedings for this Application total \$5.6 million from 2021 to 2024 and are broken out in Table 2.

Table 2

Line No.	Item (\$millions)	2021 Actual (a)	2022 Actual (b)	2023 Bridge (c)	2024 Test (d)	Total (e)
1	OEB Proceeding Costs	1.0	1.4	2.3	0.9	5.6
	Total	1.0	1.4	2.3	0.9	5.6

- c) Sponsorships serve to ascribe brand recognition benefits to Enbridge Gas in support of corporate citizenship and municipal affairs and are a form of advertising operating expense.

Examples of corporate citizenship sponsorships include Habitat for Humanity Canada to support home ownership for Black families in Ontario, the Fire Marshal's Public Fire Safety Council Project Zero to purchase combination smoke/CO alarms for distribution to communities, Project Assist to provide training materials for fire departments and the Ontario Envirothon, an environmentally themed academic competition that immerses students in hands-on-learning and discovery, led by Forests Ontario.

Examples of municipal affairs sponsorships include Chamber of Commerce membership, municipal conferences and targeted speaking opportunities to support the Enbridge Gas brand, natural gas advocacy, energy transition and the pathways to net zero, and to build strong presence and community relationships.

Memberships help demonstrate the value proposition of natural gas and delivery infrastructure for Enbridge Gas's customers and economy. Examples of memberships include Canadian Gas Association, Association of Municipalities Ontario, Medical and Related Sciences, Toronto Region Board of Trade, and Hydrogen Membership Council.

ENBRIDGE GAS INC.

Answer to Interrogatory from
School Energy Coalition (SEC)

Interrogatory

Reference:

4-4-2, p. 35

Question(s):

Please confirm that for 2023 Enbridge (or Enbridge Inc.) is making a corporate decision to reduce the amount it pays in insurance premiums by increasing the deductibles liability and non-liability insurance from \$10 million and \$20 million, respectively, to \$100 million each, resulting in an increase of \$10.4M (\$13.4M minus \$3M in previous years) in the potential cost exposure. This is offsetting by an \$8.5M reduction in insurance premiums from 2022, but represents a savings of \$19M from what Enbridge forecasts the premiums would be if it did not make the change.

Response:

Confirmed.

ENBRIDGE GAS INC.

Answer to Interrogatory from
School Energy Coalition (SEC)

Interrogatory

Reference:

4-4-2, p. 37

Question(s):

Enbridge states that the 2024 Test Year Forecast includes \$51.1 million for locate delivery costs. \$45 million of the costs are for locate delivery services provided to customers and locate delivery services required for Enbridge's own operations. \$6.1 million of the costs include internal company resources that provide administrative support to respond to locate requests.

Included in Exhibit 8-3-1 Section 1.8, is a request for a new \$200 charge for third-party contractors and other utilities asking for locates. In Exhibit 9-1-3 Enbridge is requesting a new DVA to record the difference between actual and 2024 Test Year Forecast external locate delivery service costs, offset by the revenue collected through the new locate delivery service charge:

- a) Please confirm that the amounts included in 2024 for locates do not include the expected increase in costs based on Bill 93.
- b) Are the increased requirements for locates applicable to all locates or only locates for third-party contractors and other utilities?
- c) Is the \$200 charge intended to cover the total cost of the locate or just the incremental cost?

Response:

- a) Please see response at Exhibit I.4.4-STAFF-122.
- b) The increased requirements for locates are for all locates.

- c) The \$200 delivery locate service charge is intended to cover the total cost of the locate, as provided at Exhibit 8, Tab 3, Schedule 1.

ENBRIDGE GAS INC.

Answer to Interrogatory from
School Energy Coalition (SEC)

Interrogatory

Reference:

4-4-2, p. 53

Question(s):

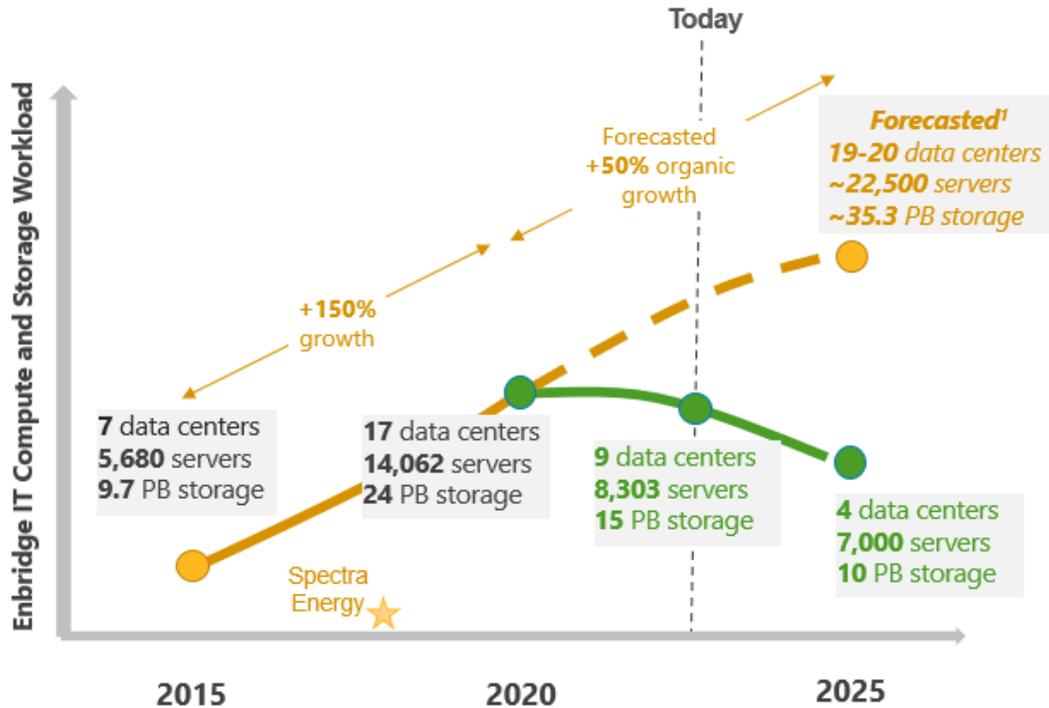

Central Functions costs have increased by \$135M since amalgamation in 2019. One of the explanations Enbridge has provided for the increase is the move to an 'as a service' model' in the Technology Information Systems area:

- a) Please describe in further detail the 'as a service' model which Enbridge has moved to and explain the reasons for the resulting increases in costs in each year between 2021 and 2024.
- b) Provide the business case for moving to this model, including the change in costs and the benefits.
- c) Provide details of the resulting reduction in capital and depreciation related to this move to an 'as a service' model.

Response:

- a) Please see response at Exhibit I.4.4-STAFF-142 part a).
- b) In early 2019, Technology Information Services' (TIS') core infrastructure was becoming a complex, multi-platform landscape with a capital cost and maintenance trajectory that was rapidly on the rise. This complexity meant TIS spend was increasing, delivery times for the implementation of new solutions was growing, there was an increase in risk for critical systems outages, and an increase in cyber risk. The landscape was also not flexible, not nimble and misaligned with business priorities including innovation, cybersecurity, talent retention, growth and environmental, social and governance (ESG) targets. Industry trends showed data centers had become a commodity and thus a non-core competency for Enbridge Gas. Please see Figure 1 for an illustrative depiction.

Figure 1: Traditional TIS Core infrastructure vs Cloud

1. 2025 numbers have been forecasted. 10% and 8% CAGR were used for both compute and storage respectively

At that time, TIS formalized the decision to invest in Cloud computing as an alternative to on premise TIS core infrastructure. Cloud computing is the delivery of computing services over the internet to offer faster innovation, reliable, scalable, flexible resources, and economies of scale without the investment in TIS infrastructure assets. The benefits of leveraging the “As a Service” (AAS) model are improved business productivity through reduction of incidents, higher velocity of TIS projects, increased cybersecurity, the lowering of system failure risks caused by natural disaster, lower energy consumption and accommodates business as well as data growth seamlessly. Since that time, as technology solutions reach end of life, the only option is AAS as traditional on-premise solutions are not readily available or cost effective.

By moving to AAS, Enbridge and Enbridge Gas avoid the intense capital investment required and instead pay a subscription fee for a solution that drives economies of scale across many clients. The risks noted above are now passed onto the service provider, who is better equipped with the expertise, resources, and foresight to manage those risks. Upgrades and enhancements are seamless and patches that protect the Company’s operations and data as a result of cyber warfare are readily implemented for the benefit of Enbridge and all other clients of the service provider.

As Enbridge and Enbridge Gas technology approaches end of life, the avoided capital investment is a benefit to the Company and customers as it is no longer cost effective to maintain expensive data centres and on-premise solutions.

- c) As noted above, AAS is the only option as the Company's technology reaches end of life, therefore the data to perform a comparable analysis between the AAS model and the traditional on-premise capital intensive model does not exist.

ENBRIDGE GAS INC.

Answer to Interrogatory from
School Energy Coalition (SEC)

Interrogatory

Reference:

4-4-2, p 53-55

Question(s):

Enbridge states that improvements to Central Functions Cost Allocation Model (CFCAM) in 2021 have led to a more representative breakdown of benefit costs between Business Unit (BU) and CF, resulting in an increase in the benefit costs associated with CF:

- a) Have the benefit costs associated with CF changed as a result of the updated Mercer Report?
- b) If so, are these included in the \$28.9M in updated costs of the 2024 O&M?
- c) If not, what is the increase in allocated CF benefit costs to Enbridge for 2024?

Response:

- a) Yes.
- b) Yes. Please see Exhibit 4, Tab 4, Schedules 2 & 3, updated March 8, 2023.
- c) Please see response to part b).

ENBRIDGE GAS INC.

Answer to Interrogatory from
School Energy Coalition (SEC)

Interrogatory

Reference:

4-4-2, Table 9 and p. 53

Question(s):

- a) Please breakdown the BU Benefits shown in Table 9 to the following components: pension and OPEB, STIP, LTIP and health and other employee benefits.
- b) Does the allocation of CF costs for pensions and OPEBs change as a result of the updated Mercer report? If so, what is the impact on O&M?

Response:

- a) Please see Table 1.

Table 1
BU Benefits Component (\$ millions)

Line No.	Particulars (\$ millions)	<u>2018</u>	<u>2019</u>	<u>2020</u>	<u>2021</u>	<u>2022</u>	<u>2023</u>	<u>2024</u>
		Actual (1) (2)	Actual (2)	Actual (2)	Actual (2)	Estimate (e)	Bridge Year (f)	Test Year (g)
		(a)	(b)	(c)	(d)	(e)	(f)	(g)
1	Pension and OPEB	40.9	25.9	23.4	16.1	(9.9)	(0.3)	(1.3)
2	STIP	49.4	49.4	50.9	47.8	33.0	37.8	38.6
3	Stock Based Compensation (LTIP)	14.7	24.2	19.7	14.1	13.5	13.8	14.1
4	Other Health & Benefits	39.1	43.1	42.1	53.3	55.1	58.3	59.7
5	APCDA Amortization	0.0	15.8	12.3	12.0	12.0	2.2	0.0
6	Total BU Benefits	144.1	158.4	148.4	143.3	103.7	111.8	111.1

Note:

- (1) 2018 reflects combined EGD and Union actuals.
- (2) In order to be responsive to this interrogatory, Enbridge Gas has produced the 2018 to 2020 breakout for certain categories based on an allocation consistent with the 2024 Test Year model.

- b) Yes, the allocation of CF costs for pensions and OPEBs changed as a result of the updated Mercer Report. The impact is a \$4.7 million increase in CF benefits costs for 2024.

ENBRIDGE GAS INC.

Answer to Interrogatory from
School Energy Coalition (SEC)

Interrogatory

Reference:

4-4-3, Table 1 and pp. 4-6

Question(s):

Based on the data in Table 1 and explanations provided, SEC has produced the following table for FTEs:

	EGD	Union	Bus	Central Functions	Total	Change in FTEs	
2013	2206	2182			4388		
2014	2194	2220			4414	26	0.6%
2015	2130	2253			4383	-31	-0.7%
2016	2063	2272			4335	-48	-1.1%
2017	1934	2239			4173	-162	-3.7%
2018	1639	1810		691	4140	-33	-0.8%
2019			3229	569	3798	-342	-8.3%
2020			2946	526	3472	-326	-8.6%
2021			3013	503	3516	44	1.3%
2022			3346	563	3909	393	11.2%
2023			3507	546	4053	144	3.7%
2024			3470	546	4016	-37	-0.9%

For years 2022-2024, Enbridge is forecasting a total increase of FTEs of 500 and has provided the following explanation for the change:

- Reduction in staff dedicated to integration work (185)
- Distribution Operations 282
- Engineering and Storage & Transmission Operations 150
- Customer Care 46
- Business Development & Regulatory 38
- Energy Services 16
- Demand Side Management 10

- a) Does Table 1 include vacant positions? If so, please quantify the vacant positions. If not, how does Enbridge budget for vacant positions?
- b) The above explanation nets to 357. Please provide an explanation for the additional 143 FTEs.
- c) One of the explanations for the increases in Distribution Operations and Engineering and Storage & Transmission Operations is to address the backlog of deferred work caused by COVID-19 restrictions. Please provide further details on the number of additional employees required to address the backlog.
- d) Are the additional employees to address the backlog considered temporary? If not, why not?
- e) The increase in FTEs in Customer Care is attributed to the growing customer base. Please provide actual and forecasted total customer #s for 2019-2024.

Response:

- a) Actual FTEs do not contain vacant positions. Please see response at Exhibit I.1.1-SEC-74 part h) for updated 2022 actual. Forecast FTEs represent the Company's expected labour resource requirements. These requirements, as provided at Exhibit 4, Tab 4, Schedule 3, paragraphs 10 to 14, are planned to be met by hiring vacant and new positions. As such, the 2023 Bridge Year includes 161 vacancies, and the 2024 Test Year includes 164 vacancies.

Historically, the Company has approximately 5% vacancies at any time resulting from employee turnover and attrition. This means that about 150 positions are typically in the process of being filled. Challenges in the labour market have resulted in a more difficult and longer process to fill vacant positions than in the past (i.e., prior to COVID-19). The Company continues to actively manage these hiring challenges.

- b) The business unit specific FTE increase from 2021 to 2024 is 457. This increase is explained by the amounts noted in the interrogatory and by correcting for the reduction in staff dedicated to integration work to 85 from 2021, as opposed to 185 from 2022, as compared to 2024 (please see Exhibit 4, Tab 4, Schedule 3, paragraph 8).

The Central Function specific increase from 2021 to 2024 is 43. Central Function FTEs shown in Exhibit 4, Tab 4, Schedule 3, Table 1, represent employees that were transferred from Enbridge Gas to Enbridge Central Functions. Changes in

Central Functions FTEs are distinct from Business Unit FTEs as Central Function costs are allocated to Enbridge Gas via CFCAM based on the services provided. Changes in Central Function FTEs are not necessarily reflective of changes in CF allocations to Enbridge Gas.

- c) Distribution Operations and Engineering and Storage & Transmission Operations are not expecting FTE increases that can be solely attributed to the COVID-19 backlog. However, the overall increase in FTEs reflects the resource requirements for the transition to post-COVID-19 sustained work volume. Please see response at Exhibit I.4.4-CCC-83 for the estimated net impact of COVID-19 on O&M costs including salaries & wages.
- d) No, the additional FTEs added for Distribution Operations and Engineering and Storage & Transmission Operations are not temporary. These additional FTEs are required to complete the work required to ensure the safe and reliable delivery of natural gas. This includes work related to the growth and maintenance of the system, and other safety and compliance related activities, which are discussed further in response at Exhibit I.4.4-STAFF-138.
- e) Please see response at Exhibit I.3.2-LPMA-22, Attachment 2 for actual and forecasted total customer count.

ENBRIDGE GAS INC.

Answer to Interrogatory from
School Energy Coalition (SEC)

Interrogatory

Reference:

4-4-3, Table 2 and p. 9

Question(s):

Please breakdown the Total Benefits and Incentive Pay column into its two components:

- a) Table 2 shows total compensation and note (3) indicates that the costs for employees that are part of CFs have been excluded from Enbridge's compensation amounts starting in 2018. Please add a column to Table 2 to show the employee costs (salaries & wages, benefits and incentive pay for the CFs), which are allocated to Enbridge.
- b) Enbridge notes that as a result of additional productivity opportunities, the expectation there could be lower FTEs than in Table 1 and this has been built into Table 2. What is Enbridge's estimate of the number of fewer FTEs in 2023 and 2024 due to productivity improvements?

Response:

- a) Please see response at Exhibit I.4.4-STAFF-139.
- b) What the Company stated at Exhibit 4.4.3, page 9 was:

Salaries and wages increase at a slower rate than expected FTE increases because of the Company's commitment to additional productivity savings embedded in the 2023 Bridge Year and 2024 Test Year O&M. As provided at Exhibit 4, Tab 4, Schedule 2, Section 1, although the Company has yet to conclusively identify additional productivity opportunities, the expectation is that active management of labour resources could result in lower FTEs than provided in Table 1 for 2023 and 2024. As such, preliminary gross O&M embedded productivity estimates of \$5 million and \$7 million have been included in the 2023 Bridge Year and 2024 Test Year, respectively.

Enbridge Gas is committing to the dollar value of embedded productivity as noted above. Changes in FTE forecasts to achieve the estimated labour component of embedded productivity can vary depending on mix of employees across entry, middle and senior level roles. Identification of opportunities to achieve the embedded productivity, including management of labour resources, will occur during company operations and the intra-year forecast update process in 2023 and 2024. At this time, 2023 and 2024 FTE forecast updates cannot be provided as identification of initiatives is ongoing.

ENBRIDGE GAS INC.

Answer to Interrogatory from
School Energy Coalition (SEC)

Interrogatory

4-4-3, Table 2 and p. 12

Question(s):

Please provide further information on the short-term incentive pay (STIP) and long-term incentive pay (LTIP) as follows:

- a) For the forecasts for 2022, 2023 and 2024 what are the assumed enterprise and business units achieved results/targets that the STIP and LTIP are based upon?
- b) In previous years, 2019-2021 what were the actual enterprise and business unit results underlying the amounts paid?

Response:

- a) The assumed enterprise and business unit multipliers embedded in the 2022 Estimate for STIP and LTIP were 1.00 (target). The 2022 to 2024 forecasts for STIP and LTIP were not projected based on performance results/targets. Instead, inflationary factors of 2.4% for 2023 and 2.2% for 2024 were used as provided at Exhibit 3, Tab 2, Schedule 4.
- b) The Gas Distribution and Storage (GDS) business unit and Enterprise performance results/targets for STIP for 2019 to 2021 are provided in Table 1.

Table 1
GDS STIP Performance Results/Targets

<u>STIP</u>	<u>Business Unit Multiplier</u>	<u>Enterprise Multiplier</u>	<u>Target</u>
2019	1.62	1.60	1.00
2020	1.75	1.27	1.00
2021	1.70	1.93	1.00

The LTIP results/targets for 2019 to 2021 are provided in Table 2.

Table 2
GDS LTIP Performance Results/Targets

<u>LTIP</u>	<u>Multiplier</u>	<u>Target</u>	
2019	1.22	1.00	2017 PSU (vested Dec 2019)
2020	1.82	1.00	2018 PSU (vested Dec 2020)
2021	1.43	1.00	2019 PSU (vested Dec 2021)

Answer to Interrogatory from
School Energy Coalition (SEC)

Interrogatory

Reference:

4-4-3, Table 3

Question(s):

Table 3 shows the Central Functions O&M allocated to Enbridge for 2018 to 2024:

- a) Please complete the following table, for each year to include the total cost of each of the Central Functions and the various allocations to each of the Segments, and then within the individual lines of business within the Gas Distribution & Storage. For example, for 2024:

Central Functions	Enbridge Allocation	Total Cost	Amount Allocated to Liquid Pipelines	Gas Transmission and Midstream	Gas Distribution and Storage	Renewable Power Generation	Energy Services	Eliminations & Other
	2024	2024						
Particulars (\$ millions)	Test Year							
	(g)							
Aviation	0.0							
CDO	2.5							
EAWM	1.9							
Executive	1.1							
Finance	36.7							
REWS	28.7							
HR	25.9							
Legal	15.3							
PAC	6.6							
S&R	7.5							
SCM	12.2							
TIS	139.7							
Benefits	61.4							
Depreciation	25.6							
Insurance	7.3							
CF Costs	372.4							

- b) For the Gas Distribution and Storage segment, please provide the same information for the allocations to the various lines of business.

Response:

- a) Please see response at Exhibit I.4.4-VECC-56 that provides the total costs by Central Function for 2018 to 2023. The Enbridge Gas share of allocations for each category of CF for each year is provided at Exhibit 4, Tab 4, Schedule 3, Table 3. Please note the 2024 total costs for Enbridge Inc. is not available. The allocation to different segments within Enbridge Inc. and individual lines of business within the Gas Distribution & Storage except for Enbridge Gas are not relevant to the approvals sought as part of the 2024 Rebasing Application.
- b) The allocation to individual lines of business within the Gas Distribution & Storage except for Enbridge Gas is not relevant to the approvals sought as part of the 2024 Rebasing Application. Accordingly, Enbridge Gas declines to provide the requested information.

Question(s):

Please complete the attached Excel file 4.4-SEC-183.

Response:

Please see Attachment 1 for the completed Excel.

Note that Enbridge Gas does not track employee costs in the categories listed in the Excel file (rows 12 to 29), and therefore in order to complete this table Enbridge Gas used assumptions on a best effort basis to support the request. Assumptions are listed as footnotes in Attachment 1.

Further, based on the required assumptions referenced above in order to populate this requested format, this information should be used for illustrative purposes only.

Compensation Costs

Please complete shaded area

Notes:

- The management category is defined as all positions at the team lead level and above, except for Approved 2013 Union, where Management is defined as all non-unionized positions above analyst level.
- The "Total Salary and Wages including overtime and incentive pay" and "Total Benefits" by category were calculated based on the proration of the FTE count applied to the average salary and burden based on the 2022 actuals.
- From 2013 to 2017, only total capitalization is available and cannot be broken down by costs, specific to the compensation category/level. As a result, Enbridge was unable to populate information in the requested format for 2013 – 2017 for rows 30 – 41.
 The 2018 to 2024, capitalization for the compensation category is available, however, it is not available in the categories listed in the excel file as noted earlier. Therefore, "Total Compensation (Allocation to OM&A)" and "Total Compensation (Allocation to Capital)" by category were prorated based on the weightings by category in the total compensation and benefits section (rows 25 – 29).

ENBRIDGE GAS INC.

Answer to Interrogatory from
School Energy Coalition (SEC)

Interrogatory

Reference:

4-4-3, p. 28 and Attachment 4

Question(s):

With respect to the Intercorporate Services Agreement:

- a) Has the Dispute Resolution Process (section 16) for CF allocations in the Intercorporate Services Agreement (ISA) been employed to resolve a dispute between Enbridge and Enbridge Inc. since 2019? If so, please describe the circumstances, results and who makes the final determination.
- b) Schedule 3 of Attachment 4 contains a CF cost allocated amount for each year agreed to by the signatories, for example for 2019 the agreed to amount is \$336.2M.
 - i. The actual 2019 CF allocation was \$237M (4.4.2 – Table 1). The confirmation notice was signed on September 28, 2020, when actual amounts would be known. Please explain the difference in amounts.
 - ii. What is meant by “Corporate adjustment & other” and how is this amount determined?
- c) Please provide a copy of the most recent CCAM Report (section 5.2).

Response:

- a) No, the dispute resolution process as provided at Exhibit 4, Tab 4, Schedule 3, Attachment 4, Section 16.1 has not been employed as it has not been necessary to this point.
- b)
 - i. The 2019 Confirmation Notice was prepared using projected CFCAM cost allocations in accordance with Section 5.3 of the ISA (Exhibit 4, Tab 4, Schedule 3, Attachment 4, page 6).

The difference in the amounts between the 2019 Confirmation Notice and 2019 actual CFCAM allocation is primarily due to a change in the presentation of Business Unit (BU) benefits. Starting with 2019 actuals, the BU portion of benefits is presented as salaries, wages and benefits within utility O&M instead of as CFCAM allocations because these benefits are not subject to allocation (i.e. they relate 100% to Enbridge Gas employees not part of the CF organization).

- ii. "Corporate Adjustment" relates to an annual reduction in CFCAM allocations which was applied between 2018 to 2021. The intent of the adjustment was to keep Enbridge Gas's overall CF allocations at levels that were comparable to EGD and Union's 2017 total CF O&M pre-amalgamation.¹ The adjustment was refined over time as the CFCAM matured and allocators which provided more transparent cost causality were introduced. In 2022, the completion of the Guidehouse Study² enabled Enbridge Inc. and Enbridge Gas to conclude that the corporate adjustment was no longer required. Instead, Enbridge Gas has leveraged the findings and recommendations of the Guidehouse Study to apply its own utility adjustments to CF costs to exclude costs that do not pass the Three Prong test from utility O&M.

"Other" relates to recoveries of CFCAM costs for CF services provided to third parties.

- c) Please see Attachment 1 for the most recent CCAM Report. Please note that the CCAM report provided by Enbridge Inc. in December 2022 pertains to the 2023 forecast for Enbridge Gas. This is the starting point for Enbridge Gas's regulated CFCAM and cost allocation review process to determine what allocated costs are applicable to its regulated business. Adjustments for utility purposes that follow are noted below:

- Remove Unregulated LOB Allocations
- Remove BU Benefits
- Remove Utility Adjustments (e.g., Aviation, CDO, Depreciation, others as necessary)

Please note that the 2023 Confirmation Notice (Schedule 3) is currently in process.

¹ The CFCAM was implemented in 2018, around the same time that EGD and Union's Mergers Acquisitions, Amalgamations and Divestitures (MAADs) application was undergoing OEB review.

NBRIDGE GAS INC.

Answer to Interrogatory from
School Energy Coalition (SEC)

Interrogatory

Reference:

4-4-3, p. 38

Question(s):

The application states that allocated depreciation costs are increasing in 2021 related to the depreciation expense expected from the implementation of a new Enterprise Resource Planning (ERP) System at Enbridge. The new ERP will integrate Enbridge Inc. systems:

- a) Is the new ERP considered an asset of Enbridge or Enbridge Inc?
- b) If it is not an asset of Enbridge, please explain as it appears to be solely for the benefit of Enbridge.
- c) If it is an asset of Enbridge Inc. what would be the dollar impact if it was reclassified as an Enbridge asset?

Response:

- a) The new ERP asset as noted above is an asset of Enbridge Inc.
- b) The ERP System is a shared asset that provides benefits to the entire enterprise. Enbridge Gas receives an allocation of the depreciation on this shared asset.
- c) If the asset were to be considered an Enbridge Gas asset the cost would be higher as it would include a similar depreciation charge to what is being allocated, plus other revenue requirement impacts including rate of return.

ENBRIDGE GAS INC.

Answer to Interrogatory from
School Energy Coalition (SEC)

Interrogatory

Reference:

4-4-3, Attachment 1, p. 10

Question(s):

With respect to the Mercer, Compensation Benchmarking Review:

- a) Please list any amounts of compensation that are included in the compensation costs included in Table 2 [4-4-3, p.8], but are not considered as part of the benchmarking study.
- b) [p.4-5] For each of the Non-Union Position and Union Position tables (2nd table on p.4 and table on p. 5), Mercer shows avg. market variances broken down in different ways (e.g. position type, compensation category). For each, please provide the avg. market variance in dollars.
- c) [p.4-5] Please explain how Mercer takes the variances of the individual positions, and aggregates them to average variances across broader categories (i.e. union and non-union (management and non-management)).
- d) Did Mercer benchmark only positions of Enbridge (EGI), or did it also include centralized service/function positions where costs are allocated to Enbridge (EGI) but are actually provided by Enbridge Inc.?

Response:

- a) As stated in the Executive Summary of the Mercer Compensation Benchmarking Review (Exhibit 4, Tab 4, Schedule 3, Attachment 1, page 2), the study covers base salary, target total cash compensation (base salary + target short-term incentives) and target total direct compensation (total cash compensation + target long-term incentives). The other compensation costs not included in the Mercer study include items such as overtime which included callout, standby, and shift premium. Eligibility for these premium pay policies is determined by role grade, with payment amounts tied to business need and hours worked. Please see response at Exhibit I.4.4-CCC-88 for copies of these compensation policies.

In Exhibit 4, Tab 4, Schedule 3, page 8, Table 2, over the period from 2013 to 2022, page 8, the compensation costs not included in the Mercer Study averaged 4.2% of base salaries/wages and was 5.2% of base salaries/wages in 2021 when the Mercer Benchmarking Study was conducted.

b) The following response was provided by Mercer (Canada) Limited:

The table below shows how Enbridge Gas's compensation compares to the market 50th percentile, expressed as a dollar-value, for both non-union positions (expressed as annualized compensation) and union positions (expressed as hourly wage rates).

	BASE SALARY	TARGET TOTAL CASH	TARGET TOTAL DIRECT
Non-Union Jobs	-\$3,000	-\$2,000	-\$2,000
Union Jobs ⁽¹⁾	-\$0.69	\$1.11	\$1.11

(1) Enbridge Gas base salary is compared to salary structure job rates (i.e., salary structure maximum) from Ontario collective agreements. Short- and long- term incentive data from our energy sector and Ontario general industry surveys have been used to supplement the data available in the collective agreements.

ENBRIDGE POSITION TYPE	BASE SALARY		TARGET TOTAL CASH		TARGET TOTAL DIRECT	
	# of benchmark Jobs	Avg. Market Variance (\$)	# of benchmark Jobs	Avg. Market Variance (\$)	# of benchmark Jobs	Avg. Market Variance (\$)
Management	96	\$4,000	89	\$8,000	89	\$15,000
Non-Management	258	-\$6,000	236	-\$6,000	236	-\$8,000
Overall	354	-\$3,000	325	-\$2,000	325	-\$2,000

c) The following response was provided by Mercer (Canada) Limited:

Job-by-job variance is calculated by dividing Enbridge Gas's compensation by the market median (50th percentile) for the benchmark job. If Enbridge Gas's compensation equals market median, then the variance will equal 100%. If Enbridge Gas's compensation is below market median, then the variance will be less than 100%. If Enbridge Gas's compensation is greater than market median, then the variance will be greater than 100%. For example, in the table below, the variance for the Engineer III is 113% indicating the job is 13% above market median, whereas the Engineer V has a market variance of 89%, indicating the job is 11% below market median.

Aggregate average market variance is calculated by taking the average of all job-by-job variances. Averages are broken out by management and non-management, therefore in the example below the average variance for non-management is taken

by calculating the average variance for all Engineers (113% + 102% + 89% / 3) for a 101% average variance, or 1% above market median. The management roles were averaged separately to get an average variance of 98%, or 2% below market median. Finally, the overall average reflects the average variance of the eight (8) positions, weighted more heavily to management than non-management positions.

Sample below is for illustrative purposes only

ENBRIDGE POSITION TITLE	MANAGEMENT/ NON-MANAGEMENT	MARKET	ENBRIDGE	
		P50	ACTUAL	VARIANCE
Engineer III	Non-Management	\$80,000	\$90,000	113%
Engineer IV	Non-Management	\$100,000	\$102,000	102%
Engineer V	Non-Management	\$120,000	\$107,000	89%
Finance Lead	Management	\$99,000	\$90,000	91%
Finance Supervisor	Management	\$100,000	\$89,000	89%
Finance Manager	Management	\$130,000	\$130,000	100%
Risk Supervisor	Management	\$111,000	\$123,000	111%
Tax Supervisor	Management	\$112,000	\$110,000	98%
Overall				99%

- d) The Mercer benchmark study did include some centralized service/function positions. The costs associated with the centralized service/function positions are subject to the cost allocation model outlined in Exhibit 4, Tab 4, Schedule 3, pages 16 to 30.

ENBRIDGE GAS INC.

Answer to Interrogatory from
School Energy Coalition (SEC)

Interrogatory

Reference:

4-4-3, Attachment 1, p. 10

Question(s):

With respect to the Mercer, Compensation Benchmarking Review:

- a) [p.10] Mercer used 44 organizations for the Union Comparator Group, the majority of which are electricity utilities which are municipally or provincially owned. How has Mercer ensured that this group is representative of private sector organizations as compared that are municipally/provincially owned?
- b) [p.4] Mercer states “Enbridge Gas base salary is compared to the collective agreement job rate (i.e. structure maximum). Mercer has supplemented the job rate data with short- and long- term incentive data from our energy sector and Ontario general industry surveys to supplement the data available in the collective agreements. This allows us to provide a perspective of Enbridge Gas’ competitiveness on target total cash and target total direct compensation.”:
 - i. Please explain what is meant by “structure maximum” and explain when it is appropriate to use the maximum as compared to the median.
 - ii. Please explain and provide examples of how Mercer has used short-and long-term incentive data to supplement information available in the collective agreements to calculate total cash and total direct compensation for the comparators.
 - iii. Please revise the Union benchmarking results to use the collective agreement job rate structure median (i.e. the mid-point within any job band).
- c) Please provide a list of each Union position benchmarked, the number of Enbridge FTEs who hold that position, the job classification as defined in the relevant Enbridge collective agreement, and the number of comparator organizations used to benchmark that position.
- d) [p.9] Please explain why Mercer did not include any non-energy companies in its Union Comparator Group.

- e) [p.9] Please explain why the Non-Union comparator groups does not include any public sector organizations such as the IESO, OEB, CER, Ontario Government etc.

Response:

The following responses were provided by Mercer (Canada) Limited:

- a) Mercer's standard methodology is to compare union positions against union positions as this provides the most relevant market data for assessing competitive positioning. Since union positions are more commonly found in the public sector, the Union Comparator Group contains relatively more municipality/provincially owned energy organizations. However, to be clear, Mercer did include private sector unions where there was available information (e.g., Algoma Power Inc., Great Lakes Power Limited).

b)

- i. Mercer's analysis for both union and non-union positions compares Enbridge's compensation to the market median (i.e., midpoint). The basis for comparison is structure maximum for union positions, and actual compensation for non-union positions.

Structure maximum is defined as the highest salary an employer is prepared to pay an incumbent for a given role. Structure maximum was used in the union analysis as it is expected union employees will work their way up to the structure maximum within a pre-defined time and will remain at the structure maximum because they are fully competent in their role. Increases are typically based solely on time in role and not performance- or merit-based.

For non-union roles, actual compensation levels are used instead of structure maximum as it is possible employees do not reach the maximum of their salary range before they are promoted and moved into a different salary range. Salary increases typically reflect market positioning and individual performance/merit, and less emphasis is placed on tenure or time in role. A comparison based on actual compensation levels is a more accurate reflection of one's competitive positioning.

For these reasons, Mercer's union analysis uses structure maximum instead of actual compensation levels.

- ii. Collective agreements used in the union analysis typically does not provide short- and long-term compensation information. As a result, Mercer extracted such information from our compensation surveys in order to estimate target total cash and target total direct compensation for the union positions. However, since comparable positions in the support career stream typically do not receive STI nor

LTI, both target total cash and target total direct for all positions equal hourly wage as a result.

iii. Mercer does not suggest an analysis based on structure median/midpoint, for the reasons outlined in part b) i.

c) The following lists the union jobs benchmarked, the number of Enbridge Gas FTE per job, and the job classification (benchmark code and benchmark title) for each:

Enbridge Job Code	Job Profile Description	Enbridge FTE	Benchmark Code	Benchmark Title
10087	Office Clerk Grade 4 (Unifor South Office)	19	AFS.01.041.S20	General Office Operations Support
01635	Work Management Clerk N (Local 975)	35	CSV.02.003.S30	Contact Center Service Technician Dispatching

01507	Gas Technician - 1st Class (Local 975)	113	PSK.05.117.S30	Gas Meter/Pipes Installation, Maintenance & Repair (Utilities)
01485	Customer Connections Field Rep (Local 975)	23	SMP.07.001.P20	General Field Sales & Account Management

d) Mercer included only energy companies as the union jobs benchmarked are most commonly found in energy companies.

- e) Mercer did not purposely exclude any public sector organizations. In fact, Alberta Electric System Operator, Hydro Quebec, Ontario Power Generation, Inc., Toronto Hydro Corporation are just a few of the public sector organizations included in the Ontario Comparator Group and Energy Comparator Group. The only reason for why organizations such as IESO, OEB, CER, etc. are not included is because our screening process included a minimum revenue threshold to ensure peer organizations are those that follow similar compensation practices as Enbridge Gas.

ENBRIDGE GAS INC.

Answer to Interrogatory from
School Energy Coalition (SEC)

Interrogatory

Reference:

4-4-3, Attachment 1, p. 10

Question(s):

With respect to the Mercer, *Compensation Benchmarking Review*:

- a) [p.3] Please provide a separate version of the non-union table that compares Enbridge positions against only general industry organizations in Ontario (Non-Union Ontario comparator group) , and national energy sector organizations (Non-Union Energy comparator group_.
- b) [p.3] For the Non-Union Ontario comparator group, Mercer used private sector organizations with annual revenue greater than \$3Bn. Please explain the reasons for this, and provide evidence, to demonstrate that include companies with lower annual revenue is not comparable.
- c) [p.8] Please explain why the non-union comparator groups does not include any public sector organizations such as the IESO, OEB, CER, Ontario Government etc.
- d) [p.3] For the Non-Union energy comparator group, Mercer used private sector organizations with annual revenue greater than \$1Bn. Please explain the reasons for this, and provide evidence, to demonstrate that include companies with lower annual revenue is not comparable.
- e) Please provide a list of each non-union position benchmarked, the number of Enbridge FTEs who hold that position, and the number of comparator organizations used to benchmark that position (broken down into each of Ontario and Energy comparator groups).

Response:

The following response was provided by Mercer (Canada) Limited:

- a) The table below shows the competitiveness of Enbridge Gas’s non-union compensation against the two comparator groups separately:

ENBRIDGE POSITION TYPE	BASE SALARY		TARGET TOTAL CASH		TARGET TOTAL DIRECT	
	# of benchmark Jobs	Avg. Market Variance (%)	# of benchmark Jobs	Avg. Market Variance (%)	# of benchmark Jobs	Avg. Market Variance (%)
Overall	354	-1%	325	-1%	325	-1%
Ontario Comparators	283	7%	278	10%	278	12%
Energy Comparators	339	-9%	315	-10%	315	-12%

The use of a blended comparator group is aligned with Enbridge being headquartered in Alberta with a large Ontario presence.

- b) Mercer followed standard practice to include companies that meet a minimum revenue threshold to ensure peer organizations included are those that have similar compensation practices as Enbridge Gas. The resulting peer group of organizations is representative of the Ontario general industry market that Enbridge sources talent from and loses talent to.
- c) Mercer did not purposely exclude any public sector organizations. In fact, Alberta Electric System Operator, Hydro Quebec, Ontario Power Generation, Inc., Toronto Hydro Corporation are just a few of the public sector organizations included in the Ontario Comparator Group and Energy Comparator Group. Organizations such as IESO, OEB, CER, etc. are not included because our screening process included a minimum revenue threshold to ensure peer organizations are those that follow similar compensation practices as Enbridge Gas.
- d) Mercer followed standard practice to include companies that meet a minimum revenue threshold to ensure peer organizations included are those that have similar compensation practices as Enbridge Gas. The revenue threshold for the Energy Comparator Group is lower than that used for the Ontario Comparator Group so that a robust data set could be generated. The resulting peer group of organizations is representative of the energy sector market that Enbridge sources talent from and loses talent to.
- e) The table below is the list of non-union positions benchmarked along with Enbridge FTE count, and comparator group used. The Ontario Comparator Group included 50 companies and the Energy Comparator Group included 44 companies.

Enbridge Position Code	Enbridge Position Title	FTE	Comparator Group Used

Answer to Interrogatory from
School Energy Coalition (SEC)

Interrogatory

Reference:

4-4-3, Attachment 3

Question(s):

Enbridge retained Guidehouse to review and assess the CF cost allocations received by Enbridge through the CFCAM for alignment with principles of the ARC, using the OEB's Three-Prong Test. It first assessed the 2022 Central Functions cost allocations budget:

- a) Please provide preliminary numbers showing the actual Central Functions cost allocations for 2022 and explain any material differences from the budget.
- b) Guidehouse concluded that 98.2% of the allocated costs to Enbridge per the 2022 budget are reasonably incurred and offer benefits that equal or exceed costs for Enbridge. Has Guidehouse or any other company reviewed the prudence of the total cost of Central Functions and the allocators for the other Segments? If so, please provide the report(s).

Response:

- a) Please see response at Exhibit I.1.1-SEC-74, Attachment 2 for the actual 2022 CF allocations. The material difference between 2022 Actuals (\$363 million) and 2022 Estimate (\$337 million) is increased benefits costs primarily due to increased STIP, LTIP and other employee benefit expenses, partially offset by savings in pension for a net increase of approximately \$43 million. Increased benefit costs are partially offset by approximately \$7 million lower insurance premiums due to Enbridge Gas's new insurance strategy as provided at Exhibit 4, Tab 4, Schedule 3, page 40, and by approximately \$8 million lower TIS costs due to deferral of some work to 2023 and lower compensation costs due to vacancies for directly attributable costs.
- b) Neither Guidehouse nor any other company has reviewed the prudence of the total cost of Central Functions. No other company has reviewed the allocators of other segments, however Guidehouse reviewed the allocators applied to the allocations to Enbridge Gas which are consistent across the segments.

ENBRIDGE GAS INC.

Answer to Interrogatory from
School Energy Coalition (SEC)

Interrogatory

Reference:

4-4-3, Attachment 3, p. 29

Question(s):

In reviewing the CF allocations for the 2022 budget, Guidehouse identified that a total of \$2,517,733 had been allocated to Enbridge for Aviation and aviation related depreciation. Guidehouse concluded that 'Using the corporate jet for executive business travel is unnecessary for a stand-alone utility in Ontario' and recommended the adjustment:

- a) Were the allocators used to develop the 2022 CF cost budget before adjustments based on the allocators used for 2021?
- b) The aviation costs were initially allocated as an Indirect Cost, which are for services provided by CFs to the whole enterprise and not specifically related to a single Segment, but from which all Segments benefit. Were Enbridge employees using the corporate jet in years prior to 2022 or was it determined that Enbridge was benefiting from the use of the corporate jet by other Segments?
- c) Has Enbridge adopted the recommendation of Guidehouse that using the corporate jet for executive business travel is unnecessary for a stand-alone utility in Ontario, as its policy going forward? If not, please explain.

Response:

- a) The allocators used in 2021 to allocate CF aviation costs were the same allocators used to develop the 2022 CF aviation costs budget before adjustments.
- b) There have been instances in years prior to 2022 when Enbridge Gas executives used the corporate jet. However, Enbridge Gas has not included any CF aviation allocations in any of its 2018 to 2021 utility results, or in its 2022 to 2024 forecasts, as provided at Exhibit 4, Tab 4, Schedule 3, Table 3, line 1. Enbridge Gas is not requesting recovery of corporate aviation costs allocated through CFCAM.

- c) Per Exhibit 4, Tab 4, Schedule 3, Attachment 3, page 29, Enbridge Gas has accepted Guidehouse's recommendation to exclude any CF costs related to use of the corporate Jet. Enbridge Gas has not included CF aviation charges allocated in any of its 2018 to 2021 utility results or in its 2022 Estimate or 2024 Test Year CF costs.

4-4-3, Attachment 3, p. 44

Question(s):

With respect to the Finance Central Function, Guidehouse made an adjustment of \$1.6M to reflect the level of effort for US Tax Services:

- a) Subsequent to the adjustment how much is being allocated to Enbridge in 2022 for US Tax Services and what work is this allocation for?
- b) Guidehouse states that 'The cost driver was subsequently updated to high-level time forecasting in the 2022 Forecast; therefore, no further adjustment is required in relation to the 2022 Forecast'. Does this mean that in 2024 US Tax Services are allocated based on forecast of time to be spent?
- c) What is the forecasted allocation in 2024 for US Tax Services?

Response:

- a) The allocation subsequent to the adjustment for U.S. Tax Services is \$0.1 million. This represents costs associated with U.S. tax compliance requirements due to one of Enbridge Gas's shareholders being a U.S. company.
- b) Yes, the 2024 U.S. Tax Services allocation is based on high-level time forecasting.
- c) The 2024 Forecast allocation for U.S. Tax Services is \$0.1 million.

5	Total	EGI	42.6	36.7	28.1	32.7	34.9	39.6	47.2

- a) Please describe what type of costs are included under the ambit of “Other”.
- b) Please show the FTES for Business development for each year in the table.
- c) Please update Table 3 for 2022 actual results.

Response:

- a) As provided at Exhibit 4, Tab 4, Schedule 2, page 12, the “Other” costs category consists of material and supplies and travel and accommodation. An example of a materials and supplies cost is data and subscription license charges. Examples of Travel and Accommodation costs are hotel, airfare, meals, and mileage.
- b) See Table 1 for Business Development & Regulatory (BD&R) FTEs from 2018 to 2024. Please note that DSM and unregulated roles have been excluded.

The BD&R FTE increase from 2021 to 2024 was incorrectly stated as 38 in Exhibit 4, Tab 3, Schedule 4, page 6, paragraph 13. The correct number should have been 31.

Answer to Interrogatory from
Vulnerable Energy Consumers Coalition (VECC)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 2

Question(s):

“The Operations department at Enbridge Gas is responsible for the safe and reliable delivery of natural gas to approximately 3.8 million customers. The distribution system that serves these customers consists of more than 147,000 km of mains and services and more than 37,000 pressure regulating stations. The department is comprised of seven Regional Operations groups and Operations Services and Governance (OSG).”

- a) Does EGI maintain separate cost records for each of the regions?
- b) Is any analysis completed as between the practices, productivity initiatives, efficiencies etc. in each of the seven regions?

Response:

- a) Yes, Enbridge Gas has separate cost records for regional O&M spend, except for costs that are tracked centrally within the Operations Services and Governance group as provided at Exhibit 4, Tab 4, Schedule 2, pages 24 to 25.
- b) Yes. Common metrics are tracked for all regions and reviewed by management regularly. Please see Attachment 1.

Answer to Interrogatory from
Vulnerable Energy Consumers Coalition (VECC)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 2, Table 5, page 35

Question(s):

- a) Other O&M shows an increase from 2022 to 2023 from \$5.9 million to \$15.9 million. Paragraph 81 attributes this to rising insurance premiums. Please provide the 2021 - 2023 annual insurance premiums (line 5 "Other O&M").
- b) For the years 2018- 2024 what is the total amount of costs (if any) that are not actual premium costs but forecast liabilities for deductibles on insurance policies (please provide, but separate out policies from Distributions Operations from all other policies in these years).
- c) Please provide a table showing all insurance premium costs for each year 2018 through 2024 and which separates those premiums recovered under CF costs and those recovered directly by the Utility. Please show separately any insurance related costs that are not paid premiums.

Response:

- a) The annual insurance premiums for 2021, 2022 and 2023 are \$15.4 million, \$15.7 million and \$7.2 million, respectively. Insurance premiums are allocations from central functions and are therefore not presented in Table 5. Line 5 in Table 5 includes forecast costs within deductibles. Please see Exhibit 4, Tab 4, Schedule 2, paragraph 82 for more details.
- b) The forecast costs within deductibles for liability insurance in 2023 and 2024 are \$13.4 million and \$12.4 million, respectively. Prior to 2023, costs within deductibles were forecasted based on a historical annual average of \$3 million per year.
- c) Please see Table 1.

Table 1
Insurance Costs

<u>(\$ millions)</u>	<u>2018</u>	<u>2019</u>	<u>2020</u>	<u>2021</u>	<u>2022</u>	<u>2023</u>	<u>2024</u>
Insurance premiums (1)	9.9	10.6	11.7	15.4	15.7	7.2	7.3
Costs within deductibles (2)	3	3	3	3	3	13.4	12.4

Notes:

- (1) Allocations from Central Functions. Please see Exhibit 4, Tab 4, Schedule 3, paragraph 83 for details.
- (2) For 2018-2022, average based on historical insurance claims data.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Vulnerable Energy Consumers Coalition (VECC)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 2, Tables 6 & 7

Question(s):

- a) Please update Tables 6 and 7 for 2022 actual results.
- b) It is unclear to us why the "Other O&M" in Table 7 is a negative amount (deduction). If this is due to allocation of costs to unregulated storage please explain why this amount fluctuates from year to year and why beginning in 2022 the deduction to O&M reduces significantly.

Response:

- a) Please see response at Exhibit I.1.1-SEC-74 part g), Attachment 4, Tables 6 and 7.
- b) The negative balance in other O&M is due to the unregulated storage allocation, which is partially offset by expenses such as employee related services, travel and accommodation, and sponsorships and memberships. Fluctuations in other O&M are due to changes in the level of these expenses.

In 2022, an increase of \$5.6 million in travel and accommodation and employee training following the lift of COVID-19 restrictions was the main cause of the increase in other O&M beginning in 2022.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Vulnerable Energy Consumers Coalition (VECC)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 2 Table 8 / Tab 4 Schedule 3 Table 3

Question(s):

- a) Please provide examples of services provided by EAWM.
- b) Please specify how many FTEs in each year were allocated to this function and explain where these FTEs are physically located.
- c) How many FTEs are directly employed by EGI in HR? How many FTEs are allocated to this function in 2024 from Central Functions?
- d) Please confirm (or correct) that \$1.1 million of the \$4.7M increase in SCM is accounted for by a transfer of costs from Operations.

Response:

- a) Please see response at Exhibit I.4.4-STAFF-144 part a).
- b) The EAWM Centralized Function had 30 and 32 FTEs in 2022 and 2021, respectively. Of these, 14 and 13 FTEs were located in Ontario in 2022 and 2021, respectively. The remaining FTEs were located in other parts of Canada (13 and 16 FTEs in 2022 and 2021, respectively) and the United States (3 FTEs).
- c) The HR Central Function has an estimated FTE of 259 in 2024, of which Enbridge Gas is estimated to have 44 FTEs on its payroll. However, the employees on Enbridge Gas payroll support other business units in Enbridge and their costs are part of the total HR CF cost pool, which is allocated according to CFCAM by cost drivers applicable to different service categories in HR (e.g. HR case volume, estimated salary by LOB, HR business partners headcount).

- d) The increase in SCM related to the transfer of warehouse costs from Operations is \$1.9 million. This is the sum of \$1.1 million and \$0.8 million provided at Exhibit 4, Tab 4, Schedule 2, paragraphs 63 and 64, respectively.

Answer to Interrogatory from
Vulnerable Energy Consumers Coalition (VECC)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Table 3

Question(s):

- a) Please show separately the TIS costs related to cyber security for each year 2018 – 2024.
- b) EGI states that a reason for the increase in TIS costs is “...*Industry shifts to ‘as a service’ models have resulted in shifting costs from capital to O&M over time.*” Please show the associated decrease in TIS capital related costs in each year 2018 through 2024.

Response:

- a) The annual TIS costs allocated to Enbridge Gas, inclusive of inflationary increases that relate directly to cyber security for 2018 to 2024 are provided in Table 1.

Table 1
Annual TIS Costs

<u>Year</u>	<u>\$ millions</u>
2018	3.8
2019	3.9
2020	4.1
2021	5.3
2022	7.6
2023	7.8
2024	8.0

- b) Please see response at Exhibit I.4.4-SEC-176 part c).

ENBRIDGE GAS INC.

Answer to Interrogatory from
Vulnerable Energy Consumers Coalition (VECC)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, page 39

Question(s):

“In addition to receiving shared services through CFs, Enbridge Gas performs services and incurs expenses on behalf of affiliates, which are subsequently reimbursed and recovered from affiliates.”

- a) Please show the amount of the above mentioned reimbursements for each year 2018 through 2024 forecast.

Response:

- a) Affiliate reimbursement of O&M incurred services and expenses by Enbridge Gas are shown in Table 1.

Table 1
Affiliate O&M reimbursement

<u>Line No.</u>	<u>Particulars</u>	<u>(\$ millions)</u>
1	2018 Actual	4.5
2	2019 Actual	4.5
3	2020 Actual	5.3
4	2021 Actual	5.4
5	2022 Actual	4.8
6	2023 Forecast *	4.3
7	2024 Forecast *	4.5

The forecast for 2023-2024 is lower than the historical actuals since the actual services provided to affiliates includes cost recovery related to preventative and/or corrective repairs & maintenance services for unforeseen and un-budgeted expenses.

Exhibit 4, Tab 4, Schedule 3 2, Schedule 1

Question(s):

- a) Please clarify if the United Way Simcoe Muskoka administers the LEAP program for all the EGI franchises (rate zones).
- b) Please show how the \$2.6 million in annual LEAP funding is calculated.

Response:

- a) Yes, the United Way Simcoe Muskoka administers the LEAP program for all the Enbridge Gas franchise areas.
- b) The minimum LEAP commitment is 0.12% of distribution revenue.¹ Enbridge Gas has reviewed the calculation of 2024 annual LEAP funding and found that the amount was carried forward from 2020. The 2024 Test Year Forecast for LEAP should be \$3.5 million which is based on the proposed 2024 distribution revenue. Please find the calculation in Table 1.

¹ EB-2008-0150, Report of the Board, March 10, 2009, pp.8-11.

Table 1
2024 LEAP Calculation

<u>Particulars (\$ millions)</u>	<u>2024 Forecast</u>
Total Revenue per 2024 Forecast	
In-franchise Delivery Revenue (1)	2,936
LEAP Funding %	0.12%
2024 LEAP Funding	3.5

Answer to Interrogatory from
Vulnerable Energy Consumers Coalition (VECC)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3, Attachment 3 - Guidehouse CF Methodology Review

Question(s):

- a) With respect to the central functions summarized in Table 3-1 of the Guidehouse Report did Guidehouse undertake an audit of the listed service categories and descriptions to satisfy itself that these functions were being provided as described?
- b) Please explain the difference as between Table 6-2 and 6-3 in the Report and Table 3 at page 32 of Schedule 3.

Response:

- a) The following response was provided by Guidehouse Canada Ltd.:

Guidehouse did not conduct, nor was Guidehouse asked to conduct, an audit of services or services levels. Guidehouse did review the CF service descriptions and interviewed service providers from Enbridge Inc., as well as service recipients at Enbridge Gas and reviewed relevant transaction records to assess that the services being provided were within the scope determined by ISA service descriptions at a high level and for reasonableness relative to what we would expect from a utility with the scale and scope of Enbridge Gas.

- b) The following response was provided by Guidehouse Canada Ltd.:

Table 6-2 includes the initially proposed 2022 Budget total CF cost allocations subdivided by cost type (Direct Charge, Directly Attributable and Indirect) unadjusted, while Table 6-3 includes these same allocated CF costs with adjustments based on the Three-Prong Test.

The following response was provided by Enbridge Gas:

Table 6-2 presents 2022 Budget CF allocations (12 month forecast). Table 3 of Exhibit 4, Tab 4, Schedule 3 contains the 2022 Estimate CF allocations (based on

year-to-date February actuals and 10-month forecast for 2022). Note that Table 9-1 of the Guidehouse Report contains the same data as Exhibit 4, Tab 4, Schedule 3, Table 3.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Vulnerable Energy Consumers Coalition (VECC)

Interrogatory

Reference:

Exhibit 4, Tab 4, Schedule 3 Table 3

Question(s):

- a) Please provide a table which shows for each category of CF costs for each year: (1) the total amount of costs in that category; (2) the EGI allocation (i.e., Table 3) and (3) the total number of affiliates/entities that the amount is allocated among.
- b) Please provide a list of all the entities in 2024 that are expected to be sharing in the costs of the programs shown in Table 3

Response:

- a) Please see Table 1 which shows the total amount of costs in each category of CF from 2018 to 2023, as well as the total number of affiliates/entities that received the CF allocations in those years. We have redacted the total amount of costs and requested confidential treatment of that information for the reasons set out in our March 8, 2023 letter to the OEB filed in this proceeding. The Enbridge Gas share of allocation for each category of CF for each year is already provided in Exhibit 4, Tab 4, Schedule 3, Table 3.

Please note the 2024 total amounts by CF category are not provided because they are not yet known. The Enbridge Gas amounts for 2023 and 2024 submitted in the evidence were estimated based on the 2022 allocation adjusted for inflation and other known factors. Please see Exhibit I.4.4-SEC-184 part c) for additional context on the 2023 amounts.

Table 2
Total Central Function Costs

Line No.	CF (\$ millions)	2018	2019	2020	2021	2022	2023
1	Aviation						
2	CDO						
3	EAWM						
4	Executive and Others						
5	Finance						
6	REWS						
7	HR						
8	Legal						
9	PACS						
10	S&R						
11	SCM						
12	TIS						
13	Benefits						
14	Depreciation						
15	Insurance						
16	Third Party Recoveries						
17	CF Costs						
18	Entities receiving CF allocations	140	134	128	124	124	126
19	Additional entities receiving only Insurance allocations	40	60	51	54	57	50
20	Total entities receiving CF and Insurance allocations	180	194	179	178	181	176

Notes:

- (1) In 2018, a portion of REWS cost resided in the BUs, subsequently centralized in 2019.
- (2) In 2018, some benefits pertaining to legacy Spectra Gas Transmission business, EGD and Union were recorded within the HR Central Function and was not segregated at the Corporate level.
- (3) External legal fees was part of the BUs in 2018, but was centralized in 2019.
- (4) S&R cost was part of the BUs in 2018, but was centralized in 2019.
- (5) Starting 2022, certain benefits relating to CF are recorded directly in CF. As a result, there is a decrease in benefits with a corresponding increase in CF cost in 2022 compared to prior year.

While the total number of entities that received the CF allocations is being provided, it is important to note the CF allocations to individual entities are based on the cost drivers listed in the evidence. Those cost drivers, among others, include 3FF (comprising revenues; gross property, plant and equipment; and compensation) applicable to individual entities that vary in size and this information is not in the

public domain for most of these entities. Please note also that Enbridge Inc. applies its CFCAM consistently to all entities receiving the allocation.

- b) A list of all entities that are expected to be sharing in the costs of the programs in 2024 is not relevant to the approvals sought as part of this Application. There are more than 120 entities that are expected to receive the CF allocations in 2024. It is also important to note that most of these entities are not required to file their financial statements in the public domain and none of these other entities are rate-regulated by the OEB.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Ref 1: Exhibit 4, Tab 5, Schedule 1, p.7

Ref 2: EB-2012-0459, Decision with Reasons, July 17, 2014, pp. 61, 62

Question(s):

Concentric recommended the use of a credit adjusted risk-free (CARF) rate as an appropriate discount rate to calculate net salvage under the CDNS method on the basis that the CARF is consistent with discount rates mandated by accounting standards for asset retirement obligations for financial statement disclosures and estimating the discount. In the OEB's Decision for EGD's 2014 to 2018 Custom IR proceeding, the utility's weighted cost of debt, and the discount rate for pension funds were noted as other possible discount rates to use.

- a) Please provide Enbridge Gas's proposed 2024 weighted cost of debt and the discount rate used for pension funds and the resulting SRC reserve using these rates.
- b) Please explain whether these rates were considered as the discount to calculate SRC reserve. If yes, please explain why they were not selected.

Response:

The following response was prepared by Concentric:

- a) Enbridge Gas's Weighted Average Cost of Debt (WACD) for 2024 is 4.17%¹ and the pension rate was 5.27%.²

Please see response at Exhibit I.4.5-IGUA-14 Attachment 1 for the live Excel CDNS model. These rates can be input into cell F5 and the impact will be seen. Please refer to Attachment 1 for the 2021 Depreciation Study tables calculated using the above discount rates.

¹ Exhibit 5, Tab 2, Schedule 1, Attachment 6, p.6, updated March 8, 2023.

² Exhibit 4, Tab 4, Schedule 2, Attachment 1, p.94, updated March 8, 2023.

- b) Please see response at Exhibit 1.4.5-IGUA-10 for a discussion of the various types of discounts rates that have been used in Asset Retirement Obligation and other Inflation Adjusted Net Salvage Calculations.

The CARF was determined to be the most appropriate rate to use in the CDNS calculations. Enbridge Gas's CARF is calculated as the forecasted 30-year Government of Canada bond rate plus Enbridge Gas's credit spread.

Concentric did not consider that a pension discount rate would be appropriate for the CDNS calculations as the rate is developed based on pension plan specific actuarial assumptions that are unrelated to the cost of debt.³

Concentric did not consider that a WACD would be appropriate for the CDNS calculations as the rate is derived from historical debt issuances that may not be the best representation of a company's current risk profile and the future cost of debt.

³ See Exhibit 4, Tab 4, Schedule 2, Attachment 1, p.96 for a description of how the pension discount rates are derived.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Ref 1: Exhibit 4, Tab 5, Schedule 1, pp.17-18

Ref 2: EB-2020-0290, Exhibit C2, Tab 1, Schedule 1, p.8

Question(s):

It states that Enbridge Gas is collecting amounts for future abandonment within the net salvage component of the depreciation rates for the EGD and Union rate zones. These amounts are included in accumulated depreciation which results in a reduction to the PP&E component of the rate base. The amounts collected are used to fund working capital requirements, which in turn reduces the need for financing and therefore has a favourable impact for customers in the form of lower rates, all else being equal. It also states that Enbridge Gas has not identified any precedents in which a utility has voluntarily set up a segregated fund for Site Restoration Costs (SRC).

- a) Does Enbridge Gas plan to recover future abandonment costs if the amount of these costs are less than the amount of the net salvage component already recovered as a part of depreciation expense?
- b) If yes, please explain whether there is double recovery for future abandonment costs.
- c) Has Enbridge Gas identified any precedents where a utility has involuntarily set up a segregated fund for SRC? If yes, please list these utilities.
- d) As noted in Reference 2, Ontario Power Generation established segregated funds for the purpose of future expenditures related to its asset retirement obligation for nuclear liabilities. Please explain whether Enbridge Gas views these segregated funds as comparable to segregated funds that could be established for Enbridge Gas's SRC.

Response:

- a) If the estimated cost for future abandonments (after reflecting discounting/the time value of money), as determined by Concentric, were determined to be less than the

outstanding balance of net salvage amounts already collected (i.e. the outstanding liability / recoveries net of costs incurred to date), the Company expects that the depreciation study would reflect that finding in the prospective salvage component of depreciation rates to be utilized going forward, thus avoiding over or double recovery of costs. For instance, the salvage component of the depreciation rates could be made zero if the recoveries net of costs incurred to date were equal to the expected cost of future abandonments, could be made negative (or zero with a possible refund) if an over collection was believed to have occurred, or be made very small to minimize the amount of prospective recoveries, if recoveries to date were approaching the estimated required amount. The Company however does not expect that an over collection would occur, assuming regular depreciation studies are performed, as the intent is to recover the required salvage costs over the life of the asset, spreading the cost to all customers that utilize the asset.

- b) Please see response at part a).
- c) Enbridge Gas has not identified any precedents where a utility has involuntarily set up a segregated fund for SRC.
- d) Enbridge Gas does not view the Ontario Power Generation (OPG) segregated funds as being comparable to what could be established for natural gas utilities. The OPG funds are in place to cover the decommissioning costs of nuclear power plants once the licensee has decided to stop operating the facility. The power plants have a significant decommissioning period (estimated at 50 years) due to the safety protocols and regulations surrounding the abandonment activity. Note that funds are only withdrawn once the nuclear facility ceases operations. In comparison, a natural gas utility does not have the same regulations regarding duration of time required to monitor the safe removal of assets. Another key difference is the number of assets maintained with the funds as utilities have a vast amount of pipeline assets and facilities vs a relatively small number of power plants for OPG. Finally, the funds are different in that OPG would only draw on the funds once the power plant is at end of life, whereas Enbridge Gas would make regular withdrawals in a year to cover the costs of ongoing decommissioning of assets as they are replaced. Also note that during the 1970 to 2010 period, Enbridge Gas had a program to replace cast iron pipe assets due to safety concerns. The retirement costs were managed with the SRC costs collected through rates without any incremental costs or impacts to customers. Please also see response at Exhibit I.4.5-ED-136.

- (3) Previously account 474.01 for Union.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Ref 1: Exhibit 4, Tab 5, Schedule 1, Attachment 1 – Depreciation Study

Ref 2: Exhibit 4, Tab 5, Schedule 1, Attachment 2

Question(s):

Page 16 of the Depreciation Study states that EGD historically used the Average Life Group (ALG) procedure, and Union Gas historically used Generation Arrangement Procedure. Furthermore, page 16 states that as Equal Life Group (ELG) more accurately reflects the actual life of the assets used, Concentric is recommending the movement to ELG at this time.

Page 7 of the Depreciation Study also states that ELG procedure is a commonly used depreciation calculation procedure that has been widely accepted in jurisdictions throughout North America.

- a) A comparison of the depreciation using the proposed and existing depreciation methodologies is provided in Attachment 2. Please quantify the 2024 depreciation expense using the ALG method of depreciation and compare it to the proposed depreciation expense, in the same format as Attachment 2.
- b) If there are material updates to the depreciation expense for 2024 resulting from 2022 financial results being finalized, please provide updated depreciation expense for 2024 in the format of Attachment 3.
- c) Please explain Enbridge Gas's views on whether the use of ELG and ALG would be allowed under IFRS.

Response:

- a) Please see Attachment 1.
- b) Enbridge Gas is not proposing any updates to the 2024 Test Year depreciation expense as a result of 2022 financial results being finalized.

- c) Enbridge Gas has not performed a comprehensive review of IFRS. Please see response at Exhibit I.1.8-STAFF-18. However, Concentric has noted that, while ALG and ELG have been used by clients reporting under IFRS, the use of the ALG procedure while reporting under IFRS often requires additional componentization of accounts in order to comply with IAS 16 Standard.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 5, Schedule 1, Attachment 1 – Depreciation Study

Question(s):

Concentric's recommendations reflect retirement and net salvage analyses in Sections 6 and 7 of the study. As well, pages 2-3 of the Depreciation Study discuss information provided by Enbridge Gas to Concentric.

- a) Please provide the following information and data used by Concentric to prepare and support the Depreciation Study:
- i. Current balances by vintage year for each account (aged balances) through December 31, 2021 in a readable Excel format that provide the amount of investment sorted by installation year.
 - ii. Retirement transactions for all accounts from 1948 through December 31, 2021 in a readable Excel format, which include information regarding the transaction year of the retirement, the installation year of the asset being retired, and the original cost of the asset being retired.
 - iii. Cost of removal and gross salvage transactions for all accounts requiring the recovery of net salvage through December 31, 2021 in a readable Excel format, which include information regarding the transaction year of the retirement, the costs associated with the retirement, and any gross salvage proceeds from the sale or reuse of the property.
 - iv. For each account, provide the output of all life/curve combinations that were considered as part of the study from the retirement rate analysis. Please include the residual measures for each life/curve combination presented.
 - v. Discussion/interview notes with EGD's operational and management staff with respect to historical life and future expectations for asset accounts that Concentric relied upon as explained in Section 3 of the Depreciation Study.

Response:

- a) The following response was provided by Concentric Energy Advisors, Inc.:
- i. Please see Attachment 1.
 - ii. Please see Attachment 2.
 - iii. Please see Attachment 3.
 - iv. Please see Attachment 4.
 - v. Please see Attachment 5.

Management Meetings

Metering

August 17, 2021

Account 478 - Meters

Meter sets, including regulator.

Union side is integrated with the Enbridge side of the system. The AMI program is discussed holistically, there is no differentiation between UGI and EGD.

The AMI meter program currently under investigation may replace the meter or may just add the ERTs. If meters are replaced, it will likely be an ultrasonic meter. This will focus on residential and small commercial meters. These meters will most likely have two-way communication. The communication technology is still being investigated – radio frequency or network technology are both being investigated. This decision has not been made yet. There will not be any joint project with Hydro 1. Implementation will likely be for 2024 at the earliest. It will likely be a 6 – 10-year deployment. There are a total of approx. 3.8 million meters which will be replaced which is the vast majority of meters on the EGI system.

A metering program needs to consider future strategies. Ultrasonic meters do not have any moving mechanical parts and tend to remain at the initially set accuracy limits during production and final inspection. With their readily available data transmission, self- diagnostics, tamper proof and theft detection capabilities, they are an ideal choice for the future of metering. Ultrasonic meters have the potential to better handle future changes. The potential for future changes in the gas composition may lead to there being different meter types throughout the province.

If ultrasonic meters are used, regulators will need to be replaced as well, however once this is done, regulators will not need to be replaced again until the regulator is approaching 30 years. Most meters were moved outside in the mid-2000s, so there is no need to move significant numbers of meters outside. This work also included the movement of all regulators outside.

Measurement Canada has allowed manufacturers to use recognized laboratories outside of Canada. This allows EGI to have ultrasonic meters approved by Measurement Canada hopefully by the end of the year. S-G-03 is the Measurement Canada specification relating to the approval of new meters.

EGI has a recognized testing facility for a wide variety of meters.

The new meters may have a different life depending on the meter selected. For example, if a meter is selected which has a lithium battery built in, the maximum life span is 20 years. However, if the battery can be replaced then the meter has a longer life span. When a manufacturer receives approval for a new type of meter from

Measurement Canada (MC), the meter is given an Initial Reverification Period (IRP), as per MC's G-18—Reverification periods for gas meters, ancillary devices and metering installations. The manufacturer can subsequently attest that the meter could have a longer seal period. The latter is validated via reliability testing on installed meters which typically results in the meter receiving an extended IRP, unconditionally.

FortisBC is looking to use Ultrasonic meters as well.

Meters that are currently in the field should have a life on average of around 25 years. These are diaphragm meters with a max life of around 28 years. The expectation is that meters will pass the 10-year sample (conducted at 9 years), the 8 year sample (conducted at 7 years), and may pass the 6 year sample (conducted at 5 years). This approach to managing the meter population has proven to be successful.

Meter sets were different between UGL and EGD. To align these, a lug swing joint was used in Southern Ontario (EGD technology). A candy cane joint is used in Northern Ontario (UGL technology).

Compressor Equipment

August 18, 2021

Compression assets that are in the former EGD system look and feel like the assets in the UGL system. EGD compressors are reciprocating units primarily used to fill storage and can be used to do very small amounts of transmission type compressions.

UGL System:

Gas transmission begins in the Dawn hub outside of Dresden. 10 centrifugal compressors – NPS 26 paralleled by NPS 34, NPS 42, NPS 48 system. Ends at Parkway facility in Mississauga where it connects with TransCanada and Enbridge Transmission take offs. Compressors located every 150 KM approximately. There is a station outside of London and one at Bright facility. There are take offs along the transmission system to move to the distribution system. The primary direction of flow on the Dawn Parkway system is from Dawn towards Parkway. It is a bidirectional system are there are times in the summer when flow is reversed. Supplies arrive at Dawn through the year and are used in the summer to fill storage. Gas pressure needs to be regulated coming out of the Dawn storage system – depending on the pool it is coming out of; it may need to be regulated up or down in pressure.

There is not much movement of gas around the storage facility – there is movement in and out of the pools and some flow between the pools.

As part of the design day (Feb. 28, 2023), all compression at the Dawn storage site is needed to remove the remaining gas out of the pools.

The units at Dawn are all centrifugal units - 3 solar units and 7 RB 211 units of varying horsepower.

There is a similar facility at Tecumseh on a smaller scale. However, all the units at Tecumseh are reciprocating compressors. Compressing stations at Dawn, London, Bright, and Parkway – total of 4 stations.

There is very little transmission compressing on the legacy EGD system.

There are integrated operations between the legacy UGL and EGD systems. The compressors are operated in the most synergistic way possible.

The reciprocal units are a variety of ages. Chatham D compressor is 10 – 12 years old, while others are from the late 1980s. The legacy Union system is about the same age.

“A” plant retired in 2012 and replaced with a Solar T70s. Major driver of retirements was emissions concerns. There was discussion about retrofitting this unit however the investment required to add scrubbers was not deemed reasonable given the age and condition of the plant.

Currently there are discussions regarding the Wabuno compressor station – it is no longer supported by the OEM. The wearable components are still available however the larger parts may not be replaceable if need be. Currently discussions regarding a new 36 pressure pipeline between Tecumseh and Dawn, which would make the compressor at Wabuno and possibly other locations unneeded. This line may be in service by 2023.

C Plant at Dawn may need replacement in the 10-year plan. Siemens gives this site a life of approximately 40 years which is similar to what EGI has seen at other sites at Dawn. Plant C was installed in 1984. The model is now obsolete with likely replacement in the next 10 years. If it is possible to keep it in good running condition until the next big expansion at Dawn, that is the best option.

Crowland Site - Peak shaving plant for Niagara area. Reciprocal unit that is 50-60 years old. It is being abandoned in the next year. This unit will no longer be necessary as it is possible to maintain pressure using the pipe pressure. Will be removed completely with a storage facility built in the same location.

Reciprocals are maintained regularly. Because the compression is used for peaking and storing gas, they are not run constantly. There are a lot of starts and stops on the system – not high hours. Maintenance is done in the summer months – all units get a check upon shut down and start up. Oil changes and overhauls are done based on hours. Maintenance is done under operating cost dollars. Major overhauls at midlife and end of life (25K and 50K hour marks) are capitalized. Major overhauls can be in the millions of dollars and require 2ish months to complete. Midlife overhaul is done at 25K hours – can be 10 – 12 years before the 25K hours are met. Overhauls are accounted for in the compressor accounts – need to consider if an overhaul account is a better option.

Climate Change Legislations – Many discussions ongoing to ensure that emissions legislation being met and ensuring that EGI is staying ahead of the requirements. Controllers are a potential for requiring replacement – some legacy devices will no longer be acceptable in 2023 and will need removal over the next few years. Corporate policy to be net zero emissions by 2050 which is ahead of the legislation, where possible EGI is making changes now to meet that target.

When units are retired the norm is to completely remove the unit and return to greenfield. The UGL system properly accounted for future costs of retirement prior to joining with the EGD system. Any equipment that can no longer be used when a unit is retired is retired at the same time.

Energy Transition (Regulatory/Finance)

August 24, 2021

The view is that the fuel-based infrastructure will continue to be used and useful the foreseeable future, but the manner in which it is used might change as Ontario transitions to a low carbon future. This means that some assets might have a different EPH than other groups, just based on the future use of these assets. For example – if the future is hydrogen, it is unknown where the hydrogen will come from (is Alberta still the right place or is it available in Ontario, will the storage facilities still be required, etc).

Most recent Sustainability report is from 2020.

Corporate view is that gas is a necessary part of the transition to the lower carbon future. This requires EGI to remain operational for the foreseeable future.

EGI likes the idea of segmentation (like the TransCanada mainline model) based on different conditions throughout different asset types.

Electric system is forecasting a shortfall of 3-4 mW by the end of the decade – this factors in changes to EVs but not the electrification of home heating. This suggests that natural gas will continue to be a necessary fuel source through the end of the decade. The number of hook ups will continue to grow but at a slower rate through the end of the decade.

By 2025 federal legislation suggests that there might be a ban of natural gas furnaces due to the carbon rules.

Federal government envisions by 2050 – natural gas half of what it is today, and half of that will be hydrogen.

There is the thought that natural gas will become more of a peaking load with the potential for lower annual throughput on residential load through 2050 if hybrid heating came to fruition.

ELG might be a really good solution – allows for a quicker recovery while still using a straight-line methodology. Similar to the methodology used by Foster's.

Underground and Local Storage & Communications

August 24, 2021

Communications is with the operations wells and emergency shut down wells within the storage system. This is not the larger communications network.

Storage is from the well head down (well head, reservoir, gathering system, measurement control system, compression, etc). The types of assets are the same on both systems.

Supply pipelines are owned by transmission companies. They come into Dawn, where there is a series of piping, compression, etc. going to a storage field. Each storage field has measurement and control, and generally compression. Some fields share pipelines. There are 35 storage fields operated by EGI (some are owned by affiliates) – these fields are mixed UGL and EGD.

Wellhead valves are cycled twice a year. They are not subject to automation.

If a well were to be abandoned – a series of plugs would be placed in the well to ensure that all porosity layers are isolated. The gravel pad is removed. The well would largely be abandoned in place with the plugs placed in. There is little/nothing to salvage. The land can continue to be used after removal – the land is currently being leased on agricultural land and it can remain as agricultural land after removal of the well. There is some long-term monitoring of the well after removal.

Well heads need to be upgraded to new code when the field is upgraded. Well heads tend to be replaced at about 20 – 30 years, although there were recently a set that was upgraded at 13 years however there have also been ones that have lived to 40 years. Well heads contain a series of valves are similar in nature to other valves within the natural gas system.

The communications system are currently 12 years at most. Thus far there hasn't been any sign that they need to be replaced in the immediate future. The SME suggests that a life of approx. 20 years is about right.

The life of a well itself is based on the life of the assets used. The pipe/casing is the life limiting factor. There is a casing log done on either a 5 or 10 year cycle. This is similar to pigging a pipeline and it checks the wall thickness of the casing in the well. If there is a leak/thinning of the wall there may be the ability to repair small issues. Larger issues result in the retirement of the well. It is difficult to properly repair the casing.

A reservoir has several wells. Observation well – generally not connected to the gathering system. They are there to monitor the pressure of the reservoir. Production well is an injection/withdrawal well.

There are 35 fields/reservoirs operated. The smallest field has 1 injection/withdrawal well, the largest has 22 I/W wells.

The fields are mainly rock with small pinholes (pores) that allow gas to be pumped back in and stored. These are not salt reservoirs.

The reservoir is fairly stable. While it is theoretically possible for the operations staff to impact the life of the reservoir itself, this has never been a problem. Produced gas at the later stage of the withdrawal cycle needs to be dehydrated before use. For some fields, there is care taken to ensure that excess water is not pulled out when removing the gas. The reservoir is discovered either suitable or unsuitable – there is little that can be done to turn a non-suitable well into a suitable one.

Over time the number of fields has grown, however there are no immediate plans to bring another field on. Currently the economics don't make sense to increase the number of fields. It is more economical to increase the pressure in the current fields instead of building new fields.

If there was ever the need for less storage, fields could be removed from service. This is unlikely. Hydrogen requires more storage space (it provides a lower heating value so more is needed) so even in a lower carbon future there is still a need for storage fields. EGI has not started any studies to ensure that the fields will be appropriate for hydrogen (the hydrogen molecule is smaller, so need ensure that the reservoirs can continue to seal). There are some industry associations that are studying the impacts of hydrogen. As of right now, there is not certainty about the use of the reservoirs being suitable for hydrogen. These are new discussions so nothing is certain just yet. The CSA codes are currently looking into this to establish a code.

Pipes are similar to other steel transmission pipes. There should be no measurable differences between these pipes and other pipes on the EGI system. These are all coated steel pipes with cathodic protection. Pipes undergo regular inspection – work is being done to make all pipes piggable.

Legacy Union wells have cathodic protection, Legacy EGD is not cathodically protection however it is undergoing a program to all be protected. Replacements to the cathodic protection is capital expense.

There is a regulated liability for the site restoration costs – these are recovered through depreciation expense. There is not an ARO for these assets. Union previously had an ARO on the books for storage which was removed at the time of the transfer to EGI.

The costs to abandon a well are between \$60K - \$100K per well. There are 350 wells on the system.

Vehicles/Fleet/Tools

August 26, 2021

Patrick is responsible for the fleet Enbridge enterprise-wide, including other business units such as Liquids Pipelines and Gas Transmission. The EGI's model for fleet acquisition is to purchase rather than lease (this is not the case in the other business groups who operate under a lease model). Enbridge enterprise fleet was brought together under a common enterprise-wide policy in the last year – This will allow consistency throughout the business units.

Replacement guidelines for Canada East (EGI falls under this) are guidelines but are not requirements, that balance what is available and how much budget is available with optimal time to replace assets. This guideline was recently reviewed by a third party and should be in place for 2022 replacement season.

Contracts are in place with specific car manufacturers (Ford, GM, and John Deere primarily).

Union and EGD are managed as one business unit through Enbridge. The legacy Union fleet and legacy EGD fleets are in separate databases and recorded separately but are managed as one fleet. Historically the two companies have had different practices for maintenance, purchase, etc. It is currently the goal to standardize this, however it will take some time. Things like policy surrounding who gets a vehicle has been harmonized. The fleet types have not been harmonized yet as this will require one full replacement cycle to occur.

It is cost neutral to move to leasing and there is currently no plan to move to a leasing model for EGI.

There are no executive fleet in the EGI system.

The fleet team manages everything from sedans/small SUVs to large semi-trucks. The largest number of vehicles are half ton/one-ton fleet

The replacement policy for light duty to half ton are 5-6 years or 160K Km.

Medium duty are 7-8 years or 160K KM.

Heavy duty is 120-month replacement – handful of vehicles. Tractor trailers,

The cranes and assets attached to vehicles are included in the fleet assets but are managed as individual assets. When the vehicle is replaced, the attachments must be replaced as well. However attachments have their own maintenance schedule.

Natural gas fleet – still a significant portion of the EGDS fleet. Approx. 1800 units on the EGD and 1200 units on the Union fleet – including 575 units that are dual fuel (between the two fleets). The number of vehicles is likely to be reduced going forward due to external factors – it is difficult to get ahold of NGV on the market right now.

While it would be in line with EGI policy to move to hydrogen powered vehicles, it is still too soon. The required infrastructure is just not widely available yet. Same is true of EVs.

When vehicles are retired – majority of EGDS vehicles go to auction, with a few going to a retail model – sold through a third party. The retail vehicles get a larger salvage however it takes a longer time. Legacy union salvage dollars roll back into vehicles budget which allows for a higher purchase budget going forward. Salvage recovery is in the single digits percentile. This is often because vehicles are used for as long as they have value. When it is time to replace them, there is not much value left.

Buildings

August 27, 2021

Actively trying to sell 2 assets at the moment.

EGI to send list of assets that are considering disposition.

Disposition is based on physical condition (using third party assessments) to determine the life cycle of the building, and functional assessment (buildings measured to a prototypical use).

Thorold undergoing right sizing.

Costs of removal on the buildings cost about \$10 per square foot in order to tear down properly.

Ottawa – no value in current buildings, all value in redevelopment. Market potential is in new apartment buildings. Leaving as the current building use is incompatible with the area.

Furnishings and finishings inside the buildings:

Interior comforts are expected to last about 15 years.

Space is very prescribed – intent is for equity across north America – all employees throughout the EG system at the same level have the same type of space.

Hotel concept (“agile spaces”) was expanded to approx. 600 people. It was found that people were not liking this system – employees were not as happy. Pre-covid there had been a plan to wind down the agile space program. Covid has changed this because there needs to be a seamless work environment between home/office/others.

Furnishings – have no secondary (salvage) value. All desks across north America are the same. Desks are moved around the EGD business when they are finished. Should be a 10 – 20 year asset.

Display screens/TV Screens/Etc – all IT assets. Meeting room tech should have a life of no longer than 5 years. This is in large part because the networks that they are connected in might not be compatible with future technology or security requests.

Multifunction devices/printers/etc – fewer printers being installed as there hasn't been a need.

Tools

August 30

Financials are split between legacy Union and EGD

Policies regarding equipping the legacy EGD and legacy Union teams – there are slight differences between which work is performed by similar roles. This is because the tasks are not always consistent between the two groups. This requires different tools for similar roles. The process by which tools are purchased, inspected, maintained are the same between two groups. There is a desire to have life estimates that are similar/the same, particularly for larger tools. There is a desire to have tools split between larger groups (tag-along type tools) and smaller hand tools. SME believes that currently larger tools comprise slightly less than half of the account (this is a rough estimate). These tools should have a life of approx. 15 years.

Battery powered tools comprise the majority of the smaller group of tools. Smaller tools are considered anything less than \$1K. Non-battery powered are powered via electric inverter off the truck.

Hand operated battery tools should have an average life of approx. 5 -7 years.

Distribution System

August 30, 2021

Differences between the legacy Union vs legacy EGD – Enbridge has up to 10-inch plastic, Union has up to 6 inch plastic. Otherwise, there are no major differences.

There appears to be a fair amount of vintage plastic pipe in the Union Gas system. This pipe has been carefully monitored, but there hasn't been a pipe replacement program yet. Replacement of pipe and fittings are targeted based on maintenance programs. These pipes have a small amount of copper at the pipefittings. The pipe is fine, the issues seem to occur on the copper fittings. The riser is replaced at the same time when possible.

There are some (several thousand) inside regulators/meters at legacy union. There have been program retirements to remove these on the legacy Enbridge side however there are still a few left. When replacements are made outside, it is preferred to move the regulators/meters just outside the wall when it is possible. When meters are moved from inside to outside, it can be initiated by either Enbridge or the customer. These fittings can be a variety of vintages, up to 2003.

Services & Mains

There are still copper services on the legacy Enbridge system. There are none left online in the Union system. Neither system has cast iron services.

Most services are steel (bare and unprotected or bare and protected (referred to as "vintage steel")). There is an ongoing vintage steel (pre-1970) replacement program – projects are prioritized it is replaced as it is identified as an area of concern. EGI is working to get ahead of the upcoming wave of retirements for vintage steel. It is being replaced by plastic. Plastic up to 550 kPa. Anything above this is steel. There is 17000 KM of vintage steel – about 5500 KM will be replaced over 20 years.

Plastics – There was a capital plan to replace a number of cracked caps in the 2001 era. The ongoing maintenance programs identify any new fittings and pipe, including cracked caps, that require mitigation.

Hydrogen – There may be the requirement for larger diameter pipelines in the future as the properties of hydrogen require bigger pipes. There are currently no plans to change pipes as nothing concrete has been decided upon yet. Hydrogen might impact the steel life as well – there may be some internal corrosion with hydrogen that was avoided with gas.

Renewable natural gas – could require some changes to the system in order to be operational. The RNG is starting to gain some traction as there are a number of projects ongoing or in the planning stage at this time.

Pipe is generally retired in place. The pipe is purged, cut into sections, and sealed. The costs of removal are typically 5 – 12% of the total replacement costs.

Most of the distribution system in residential areas operate at a 420kPa MOP and the residential meter set reduces to the delivery pressure

Distribution Stations

System stations measure, and regulate pressure to align with distribution systems. The pressure requirements are designed and optimized by the Engineering department.

Gas is heated and odorized at the TC Energy custody transfer stations. .

Regulating stations are typically located outside of buildings in legacy union. Legacy Enbridge more commonly uses buildings around regulating stations. This difference is largely due to the operating areas – EGD area tended to be more residential and required buildings to gain approval. Buildings that are used are typically pre-fab buildings.

On Legacy EGD side – 20 inches on Lakeshore has had 4.9 KM replaced and there is a total of 40 KM that needs to be replaced. It is very old, and the remaining pipeline will be replaced over the next 10 years.

12-inch KOL line through the busiest cores in Toronto. There are coating issues on this pipe, and it is targeted for replacement in the next 10 years.

Transmission System

August 31, 2021

Transmission system imports gas into Dawn storage facility. From there, gas leaves onto Dawn Parkway system (towards Toronto), Panhandle system (Winsor), and Sarnia system (fed primarily off of Vector and Great Lakes). Gas goes to distribution system.

Legacy Union vs Legacy EGD – primarily the systems were operated for similar purposes in similar manners. The Union side had a much larger storage and transmission system than the EGD. Union is more of a traditional system while the EGD system was more of a support line from TC Energy. There is nothing on the EGD side that is classified as transmission. There will be a harmonization to move some of the EGD assets into a transmission classification as part of the 2023 application.

36- and 42-inch pipelines are approx. 7-8 years old.

Dawn parkway systems were first built in 1950s. There have been ebbs and flows of upgrades through the years. There was a big expansion in 2007/2008. Another big one in 2014-2016. This is approx. 225 KM. Compression is located at Dawn, station at Lobo, Bright, and the Terminus at Parkway.

Panhandle system was 16- and 20-inch pipeline from Dawn when installed. This is approx. 80 KM. All compression is located at either end of the system.

Pipelines are all large diameter, coated steel with cathodic protection.

There are some parts of the 42-inch pipe that have some troublesome areas. This has been a known issue and has been repaired as needed.

There has never been a large segment (over approx. 100 meters) replaced due to condition of the pipeline. Smaller segments are replaced as needed however the pipe as a whole is in good condition.

Pigs are run approx. every 7 years based on a risk-based assessment.

Program for gate station inspections is beginning. Referred to as the facilities integrity management program.

1000 psi off of the TransCanada system. Regulated down to approx. 400 psi. The station at the custody transfer is owned by Enbridge and includes odorization.

Valves are located every 20 km. These valves have been replaced as needed but there hasn't been any sort of program retirement. There are many hand operated valves on the system still, however most are not manual.

16 inches on the panhandle was removed and new pipe was installed in the same location. Easements are typically silent on if the pipe needs to be removed.

Computer Hardware and Software

August 31

There are some assets owned by Enbridge Corp – for example Workday application (manages employee information/HR type data).

Another example is Oracle software – Enbridge financial systems

There is an ongoing project to unify the corporate software where possible. This will entail costs being retired off of the EGI books in instances where there is duplication in the systems between Union and EGD.

Legacy Union used SAP system as the enterprise software.

Major upgrades on major software tends to occur every 10 – 12 years.

Hardware

Laptops, desktops, in office and field, telephone equipment, video conferencing equipment, mobile devices (cell phones, radios), network equipment. In the past there was a data centre but being decommissioned with cloud migration – data centre is moving to the cloud. Currently in the process of decommissioning. This move to ‘as a service’ model is driven primarily by the Technology Industry shift from traditional capital-intensive data center management to O&M intensive infrastructure ‘as a service’ model

Field laptops are more rugged,

Bell and Rogers three-year plan for cell phones.

Radios should last for about 4 years.

More significantly into laptops – small number of junior employees who may use desktops but most people on laptops. Average age for laptops is a 4-year cycle – manufacture warranty is 3 years. Ruggedized laptops have a similar life cycle.

Video conferencing assets – 4-year refresh period.

No change in average use of assets.

SME suggests that a 4-year life is about right for this account.

Energy Transition

September 7, 2021

Consistently selling out storage that is currently on the system.

The fact that the assets are already in place and the Ontario system is very peaky means that there will likely be a long-term need for underground storage regardless of above ground requirements.

Some of the storage is used for transmission clients as well which would not be impacted by any potential decline in residential usage.

Higher electrification of the residential system could lead to higher usage of the storage system due to the need for natural gas fired power plants.

It may be too early to institute an economic life on the transmission or storage system. Transmission and storage will likely have a longer life than the distribution system.

Energy Transition

September 9, 2021

Energy Transition Scenario Analysis – last year and currently wrapping up. Looks at the demand on the system due to climate change policy. 20-year time frame (2038). Does not include anything to do with costs or rates. Does not include predictions on if scenarios will occur. Scenarios are all plausible but there may be technical changes required.

Decarbonization Pathway Study – Builds on ETSA (electrification scenario and diversified scenario). Just beginning this project. Looks at a province wide scenario at 2030 and 2050. Includes costs and feasibility scenarios.

- Diversified – steady progress plus low-carbon gas mandates, hydrogen and carbon control and storage deployment strategy, selective electrification

Preliminary results are showing signs tht similar GHG emission targets can be met with diversification but with retaining (and increasing) throughputs due to renewable natural gas, carbon capture, and hydrogen.

Rebasing will include a study to see if system is hydrogen ready.

Metering Program Update

November 22, 2021

Slower rollout of metering program will build into a full program in the later future. Program begins Jan 1, 2024.

New devices will be a smart meter upon the retirement of existing meters, however there are not going to be any proactive replacement programs. There are no longer going to be ERTs added to meters, however organic meter replacement will be to smart meters.

This slower rollout will result in a mixed asset mix in the metering accounts. The newer meters might have a lower life, particularly through this change period.

CNG/NGV Update

November 23, 2021

Smaller VRA program includes ice cleaners. Larger compressors to fill garbage trucks in the city of Toronto – bigger program at 3 main sites. Along with this is an agreement with ComTech to finance the appropriate units.

Mobile fueling is the newest program – currently 5 with 3 more coming on board in the new year and possibly more in 2022.

Light duty vehicles are likely to go electric rather than NGV. However more heavy duty vehicles are more likely to go to NGV. Transport trucks, garbage trucks, etc would require a quarter of their total weight limits to be able to use batteries, while it can be done easily in NGV.

The big target for this program is the diesel market due to the upcoming clean fuel standards.

The compression and fueling assets are very similar to the compressing assets in other accounts. Compressors get recertified every time they are deployed. The mobile compressors are approx. 15-year assets, but there is a life extension due to periodic upgrades and overhauls. The compressors being on mobile devices may have an impact on the life, but it is not known yet.

487.8 contains the sales type lease.

487.7 and 487.9

Energy Transition Update

November 24, 2021

Still believes it is too early to tell with any certainty what an end-of-life date would look like. There are signs that there will be a decline in energy use, but with the possibility of hydrogen in the future, there may even be need to expand pipes. Currently “at a fork in the road” with no clear guide of where things are going.

There may be the potential for carbon capture on some of the compressor units, which would allow compressors to continue use even after environmental regulations change.

Current strategy is to stay the course on pipe replacement programs.

The upcoming IRP will have the vintage steel pipe replacement program.

There may be some compressor obsolescence related to traditional obsolescence (they are no longer appropriate for the need) – this is not due to energy transition but due to other reasons. These are typical wear and tear replacements, however there is more coming due than typical which results in an increase in spending for these accounts. Units are typically replaced at about 40 years, and the ones being replaced are over 50 years.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Exhibit 4, Tab 5, Schedule 1, pp. 2-3

Question(s):

In Schedule 1, Enbridge Gas discusses depreciation studies and rates prior to and after amalgamation of EGD and Union.

- a) Please confirm that the last public depreciation study for EGD was as filed in the EGD 2013 Cost of Service proceeding EB-2011-0354. Please provide an explanation if not confirmed.
- b) Please indicate if EGD had any subsequent depreciation studies or analysis initiated (internally, or studies by consultants, reviewing any of depreciation lives, rates or salvage costs) since the 2013 EGD Cost of Service, and if so please provide the dates and circumstances for the studies and provide a copy.
- c) Please confirm that the last public depreciation study for Union Gas was as filed in the Union Gas's 2013 Cost of Service proceeding EB-2011-0210. Please provide an explanation if not confirmed.
- d) Please indicate if Union Gas had any subsequent depreciation studies or analysis initiated (internally, or studies by consultants, reviewing any of depreciation lives, rates or salvage costs) since the 2013 Union Gas Cost of Service, and if so please provide the dates and circumstances for the studies and provide a copy.

Response:

- a) Confirmed.

- b) EGD engaged Gannett Fleming¹ and Concentric to conduct subsequent studies following the depreciation study in EGD's 2013 Cost of Service EB-2011-0354.
- i. Gannett Fleming completed a net salvage study in June 2013 to support the decision in the EGD Cost of Service EB-2011-0354 Settlement Agreement to extend the period over which certain assets are depreciated and in conjunction, review the implications of this on the amount of SRC collected over time. Please see the filed study at EB-2012-0459, Exhibit D2, Tab 1, Schedule 1.
 - ii. Gannett Fleming completed a draft depreciation study in February 2017 to support the expected 2019 rebasing application for EGD. The study was not completed or reviewed by management and is not relevant to this application. The study was not used due to the amalgamation of EGD and Union Gas. Please see Attachment 1.
 - iii. Concentric completed a depreciation study in January 2019 to support proposed depreciation rates for new technology projects. The study was not used. Please see Attachment 2.
- c) Confirmed.
- d) Union engaged Foster Associates to conduct a depreciation rate study in June 2017 to support the expected 2019 rebasing application for Union Gas. The study was completed but not reviewed by management and is not relevant to this application. The study was ultimately not used due to the amalgamation of EGD and Union Gas. Please see Attachment 3.

¹ Mr. Kennedy was employed by Gannett Fleming until April 2017 and any studies completed after April 2017 were done by Concentric Advisors

Attention: Mr. Andrew Mandyam, Director
Regulatory Affairs and Financial Performance

Ladies and Gentlemen,

Pursuant to your request, we have conducted a depreciation study related to the gas distribution and general plant assets of Enbridge Gas Distribution (“EGDI” or the “Company”) as of December 31, 2016. Our report presents a description of the methods used in the estimation of depreciation, the statistical analyses of service life, the analysis related to net salvage, and the summary and detailed tabulations of annual and accrued depreciation.

The calculated annual depreciation accrual rates presented in the report are applicable to plant in service as of December 31, 2016. The depreciation rates are based on the straight-line remaining life method using the average service life procedure. A periodic review of the depreciation rates using the same estimates and methods is recommended.

Respectfully submitted,

GANNETT FLEMING CANADA ULC

ENBRIDGE GAS DISTRIBUTION INC. DEPRECIATION STUDY

EXECUTIVE SUMMARY

Pursuant to Enbridge Gas Distribution Inc.'s request, Gannett Fleming Canada ULC ("Gannett Fleming") conducted a depreciation study related to the gas distribution and general plant assets as of December 31, 2016. The purpose of this study was to determine the annual depreciation accrual rates and amounts for book and ratemaking objectives.

The depreciation rates are based on the straight line method using the average service life ("ASL") procedure and were applied on a whole life basis. The calculations were based on attained ages and estimated average service life, and forecasting net salvage characteristic for each depreciable group of assets. As in the previous study, the net salvage estimates were calculated using the Constant Dollar Net Salvage methodology.

EGDI's accounting policy has not changed since the last depreciation study was prepared. Nor, was there any significant policy changes thus affecting the results of this study presented here within.

Gannett Fleming recommends the calculated annual depreciation accrual rates set forth herein apply specifically to gas distribution and general plant in service as of December 31, 2016 as summarized by Tables 1A and 1B of the study by account detail. Supporting data and calculations are provided as well within the study.

Finally, this study results in an annual depreciation expense accrual of \$306 million when applied to depreciable plant balances as of December 31, 2016. The report study results are summarized at an aggregate functional group level as follows:

SUMMARY OF ORIGINAL COST, ACCRUAL PERCENTAGES AND AMOUNTS

PLANT GROUP	ORIGINAL COST	ANNUAL ACCRUAL	
	\$'s	%'s	\$'s
(1)	(2)	(3)	(4)
UNDERGROUND STORAGE PLANT	457,724,197	2.08	9,538,232
DISTRIBUTION PLANT	7,849,497,411	2.81	220,233,090
GENERAL PLANT	145,801,888	9.31	13,570,932
COMPUTER AND SOFTWARE	333,555,758	18.91	63,073,005
TOTAL PLANT IN SERVICE	8,786,579,253	3.49	306,415,259

PART I. INTRODUCTION

ENBRIDGE GAS DISTRIBUTION INC.
DEPRECIATION STUDY
PART I. INTRODUCTION

SCOPE

This report sets forth the results of the depreciation study for Enbridge Gas Distribution Inc., to determine the annual depreciation accrual rates and amounts for book purposes applicable to the original cost of gas distribution and general plant at December 31, 2016. The rates and amounts are based on the straight line whole life method of depreciation with a separate amortization of the variance between the book depreciation reserve and the calculated accrued depreciation. This report also describes the concepts, methods and judgments which underlie the recommended annual depreciation accrual rates related to gas distribution and general plant in service as of December 31, 2016.

The service life and net salvage estimates resulting from the study were based on: informed engineering judgment which incorporated analyses of historical plant retirement data as recorded through December 31, 2016; a review of Company practice and outlook as they relate to plant operation and retirement; and consideration of current practice in the gas distribution industry, including knowledge of service lives and net salvage estimates used for other gas distribution companies.

PLAN OF REPORT

Part I Introduction, contains statements with respect to the plan of the report, and the basis of the study. Part II. Development of Depreciation Parameters, presents descriptions of the methods used in the service life and net salvage studies. Part III. Calculation of Annual and Accrued Depreciation presents the methods and procedures used in the calculation of depreciation. Part IV. Results of Study, presents summaries by depreciable group of annual and accrued depreciation. Part V presents the results of the Retirement Rate Analysis and Service Life Statistics and Part VI presents Net Salvage Analysis. Detailed tabulations of annual and accrued depreciation is presented in Part VII of this report. An overview of Iowa curves and the Retirement Rate Analysis are set forth in Appendix A of the report. An overview of the net salvage analysis is presented in Appendix B of this report.

BASIS OF THE STUDY

Depreciation

For most accounts, the annual and accrued depreciation were calculated by the straight line method using the average service life procedure. For certain General Plant accounts, the annual and accrued depreciation are based on amortization accounting. Both types of calculations were based on original cost, attained ages, and estimates of service lives and salvage. Variances between the calculated accrued depreciation or amortization and the book accumulated depreciation are amortized over the composite remaining life of each account.

Continued monitoring and maintenance of the accumulated depreciation reserve at the account level is recommended. Gannett Fleming has determined an amortization amount to correct the present variance with the calculated accrued depreciation, (“theoretical reserve”), over the composite remaining life of each account. This adjustment mechanism, whether determined separately as an amortization amount or incorporated in the calculation of remaining life accruals, is widely-accepted. An explanation of the monitoring of the accumulated depreciation reserve and the calculation of the true-up provision is presented beginning on page III-5 of the report.

The straight line method, average service life procedure is a commonly used depreciation calculation procedure that has been widely accepted in jurisdictions throughout North America. Gannett Fleming recommends its continued use. Amortization accounting is used for certain General Plant accounts because of the disproportionate plant accounting effort required when compared to the minimal original cost of the large number of items in these accounts. Many gas distribution utilities in North America have received approval to adopt amortization accounting for these accounts.

Service Life and Net Salvage Estimates

The service life and salvage estimates used in the depreciation and amortization calculations were based on informed judgment which incorporated a review of management’s plans, policies and outlook, a general knowledge of the gas distribution utility industry, and comparisons of the service life and net salvage estimates from our studies of other gas distribution utilities. The use of survivor curves to reflect the expected

dispersion of retirement provides a consistent method of estimating depreciation for gas distribution plant. Iowa type survivor curves were used to depict the estimated survivor curves for the plant accounts not subject to amortization accounting.

The procedure for estimating service lives consisted of compiling historical data for the plant accounts or depreciable groups, analyzing this history through the use of widely accepted techniques, and forecasting the survivor characteristics for each depreciable group on the basis of interpretations of the historical data analyses and the probable future. The combination of the historical experience and the estimated future yielded estimated survivor curves from which the average service lives were derived.

Gannett Fleming considers that continuing the use of a Constant Dollar Net Salvage ("CDNS") approach to the calculation of net salvage percentages is appropriate for EGDI at this time. With this approach, all historic influences of inflation are removed from the calculations by bringing the original cost of the retirement plant to a current dollar level, and further, by normalizing the historic costs of removal to a 2016 cost base. In this manner a removal cost estimate, net of inflationary impacts can be determined. The normalized cost of removal is then inflated through to the end of the estimated composite remaining life of the account using an independent estimate of long term inflation, and then discounted back to 2016 to recognize the time value of the funds collected over period of time from now through the end of the estimated remaining life.

The depreciation rates should be reviewed periodically to reflect the changes that result from plant and reserve account activity. A depreciation reserve deficiency or surplus will develop if future capital expenditures vary significantly from those anticipated in this study.

PART II. DEVELOPMENT OF DEPRECIATIONS PARAMETERS

PART II. DEVELOPMENT OF DEPRECIATION PARAMETERS

DEPRECIATION

Depreciation, in public utility regulation, is the loss in service value not restored by current maintenance, incurred in connection with the consumption or prospective retirement of utility plant in the course of service from causes which are known to be in current operation and against which the utility is not protected by insurance. Among causes to be given consideration are wear and tear, deterioration, action of the elements, inadequacy, obsolescence, changes in the art, changes in demand, and the requirements of public authorities.

Depreciation, as used in accounting, is a method of distributing fixed capital costs, less net salvage, over a period of time by allocating annual amounts to expense. Each annual amount of such depreciation expense is part of that year's total cost of providing gas distribution utility service. Normally, the period of time over which the fixed capital cost is allocated to the cost of service is equal to the period of time over which an item renders service, that is, the item's service life. The most prevalent method of allocation is to distribute an equal amount of cost to each year of service life. This method is known as the straight-line method of depreciation.

The calculation of annual and accrued depreciation based on the straight line method requires the estimation of survivor curves and is described in the following sections of this report. The development of the proposed depreciation rates also requires the selection of group depreciation procedures, as discussed in Part III of this report.

ESTIMATION OF SURVIVOR CURVES AND NET SALVAGE PERCENTAGES

Survivor Curves

The use of an average service life for a property group implies that the various units in the group have different lives. Thus, the average life may be obtained by determining the separate lives of each of the units, or by constructing a survivor curve by plotting the number of units which survive at successive ages using the retirement rate method of analysis.

The range of survivor characteristics usually experienced by utility and industrial properties is encompassed by a system of generalized survivor curves known as the Iowa type curves. There are four families in the Iowa system, labeled in accordance with the location of the modes of the retirements in relationship to the average life and relative height of the modes. The left-moded curves are those in which the greatest frequency of retirement occurs to the left of, or prior to, average service life. The symmetrical-moded curves are those in which the greatest frequency of retirement occurs at average service life. The right-moded curves are those in which the greatest frequency occurs to the right of, or after, the average service life. The origin-moded curves are those in which the greatest frequency of retirement occurs at the origin, or immediately after age 0. The letter designation of each family of curves (L, S, R or O) represents the mode of the associated frequency curve with respect to the average service life. The numerical subscripts represent the relative heights of the modes of the frequency curves within each family.

A discussion of the general concept of survivor curves and retirement rate method is presented in Appendix A of this report.

Constant Dollar Net Salvage

There are two components to the development of an appropriate future net salvage percentage for mass property accounts. Firstly, an estimate of the current net cost of removal of facilities is developed. The ratio of net salvage costs to the original cost of plant retired is developed and used as one indicator of the current estimated cost of removal. However, as the plant is removed a number of years following its installation, the cost of removal is usually greatly increased due to the impacts of inflation. In particular, the cost of removal is almost exclusively labour-related. The inflationary pressures of the Ontario labour market, due to numerous and unique labour fluctuations have a dramatic impact on the net cost of removal percentages. As such an historic ratio developed by comparing cost of removal expenditures to original cost dollars retired has an inherent level of inflation built in, and cannot be considered to be time synchronized.

Once the historic indications of net costs of retirement are determined, the depreciation analyst can compare the historic indications of the net costs to remove plant, to the costs of the engineering projects currently being undertaken, or planned to be

undertaken in the near future. However, it is normal to make adjustments to the historic indications and in many circumstances the historic indications of net salvage costs are adjusted to reflect the projects currently underway.

The second component required in the future estimation of costs of removal, is to determine the cost required at the time of forecast retirement. Once the current estimate of the net costs of removal are established, the current estimate needs to be adjusted to recognize the impacts of inflation over the period from the current time, to the estimated remaining life of the account. For the purposes of this study a future inflation rate of 1.43% was used in the calculations included in this report.

In order to recognize that the funds collected in current periods will not be expensed until potentially many years into the future, a discounted cash flow calculation is required. In this manner, the fact that the utility has received the benefit of the funds as working capital through the inclusion of the requirement into the current period revenue requirements, **Gannett Fleming discounted the future requirements by Enbridge Gas Distribution Inc.'s currently estimated cost of debt. This discount rate and calculation is consistent with the evidence of interveners in the last Incentive Regulation Proceeding [NTD: is this correct].** As such, Gannett Fleming included a discount rate of 4.83% in the CDNS calculations.

Survivor Curve and Net Salvage Judgments

The survivor curve estimates were based on judgment which considered a number of factors. The primary factors were the statistical analysis of data; current policies and outlook as determined during conversations with management personnel and on the knowledge Gannett Fleming developed through the completion of numerous gas distribution utility studies.

EGDI has not historically had access to data representing the age at retirement for all accounts. Previous depreciation studies were filed using computed mortality information, and this age at retirement information was approved by the Ontario Utilities Commission. This approved database of retirement activity through December 31, 2010 continued to be used in this study. In addition, for the current depreciation study, computed mortality data was used for retirements occurring in 2011, 2012, and 2013

using the parameters approved in the previous depreciation study. Actual aged data was available for years 2014, 2015, and 2016, and was used in the study. Therefore the retirement rate analysis presented in this study is based on a combination of data developed using the computed mortality method and, for the more recent years, actual aged data.

The estimates of net salvage were based in part on historical data related to actual retirement activity for the years 1948 through 2016 for most accounts. Gross salvage and cost of removal as recorded to the depreciation reserve account and related to experienced retirements were used. Percentages of the cost of plant retired were calculated for each component of net salvage on both annual and five-year moving average bases.

The net salvage estimates are expressed as percentages of the cost of plant. The net salvage estimates for gas distribution plant represent a weighting of the net salvage applicable to retirements prior to truncation and zero net salvage for retirements at truncation.

The following discussion, dealing with a number of accounts which comprise the majority of the investment analyzed, presents an overview of the factors considered by Gannett Fleming in the determination of the average service life and net salvage estimates. The survivor curve estimates for the remainder of the accounts not discussed in the following sections were based on similar considerations.

Account 473.00 – Distribution Plant - Services – represents 34% of the depreciable plant studied. The retirements, additions and other plant transactions for the period 1956 through 2016 were analyzed by the computed mortality and retirement rate methods. The original life table as provided on pages V-26 and V-27, and as plotted on page V-25, show consistent retirement ratios through the life of this account, indicating a lower mode curve.

The lowa curve matching procedures employed by Gannett Fleming resulted in an lowa 47-L1.5 being considered the best fit to the historic retirement trends with a residual

measure of 1.88¹. The Iowa 47-L1.5 represents a comparable life estimate with the currently used Iowa 45-R2.5, and is within the Canadian peer range of 45 - 62 year estimates.

The operational staff discussions did not indicate any reason to believe that the plant currently in service should have any significant changes from the plant in service as of the currently approved rates. Currently, this account has an “R” moded curve, indicative of assets without a long tail at the end of the life. The currently approved R2.5 has a residual measure of 7.35. The data indicates that a “L” shaped curve is most accurate, however the long tail is not representative of the assets in this account. The “S” shaped curve gives a very good fit to the data, with a residual measure of 3.38, while recognizing that the assets do not have a long tail.

Interviews conducted by Gannett Fleming with the Operations group indicated that, while the system was historically built up through the acquisition of smaller municipally owned gas distribution systems (resulting in a mix of material types and installation practices), the system is now mostly comprised of plastic pipe. Review of the surviving plant in service as provided at page III-89 of this report indicates that the vintages beginning in the late 1970’s provide for the majority of plant in service. Likewise, the era prior to 1977, where early generation uncertified plastic pipe has exhibited within the industry to be an issue, does not comprise a significant portion of the investment remaining in service. The expectation of the operational staff is that, because the system is now largely comprised of certified plastic pipe, the future life of the plant will not be impacted by future programs related to early generation plastic pipe, and the historic indications provide for a meaningful analysis of the future life expectations.

As the Iowa 45-S1 is consistent with operational staff interviews and is consistent with peer Canadian gas distribution companies, the Iowa 45-S1 is forecast to be representative of the anticipated future retirement activity. Consequently, the continuation of the currently approved 45-year average service life is reasonable.

¹A Residual Measure is based on a least squares solution of the differences between the stub curve (and original data points) and smooth survivor curve which also requires a balancing of the differences above and below the stub curve. The criterion of “goodness of fit” is the mean square of the differences between the points on the stub and fitted smooth survivor curves. The Residual Measure, or standard error of estimate is the square root of this mean square. As a result, the lower the Residual Measure the better the statistical fit between the analyzed Iowa curve and the observed data points.

A net salvage study is presented for this account on pages VI-12 and VI-13 which reviewed the net salvage characteristics resulting from the retirement experience for a 33-year period from 1983 through 2016. Over this historic period, the company has incurred \$230 million to retire \$688 million of original cost of investment and made less than \$1 million in recovery from the reuse of the assets or through sale proceeds. As such, this historic net salvage percentage is negative 33 percent.

Gannett Fleming also reviewed the three-year rolling average of the historic net salvage requirements and note that the three most recent three-year rolling averages have been lower than negative 170 percent. The most recent five-year rolling band shows a negative 193 percent salvage. Gannett Fleming views that a significantly more negative net salvage percentage is required based on the last five years of historic experience.

As the net salvage percentage of negative 100 percent provides a good representation of historical net salvage percentages and is consistent with operational staff interviews, the percentage of negative 100 is forecast to be representative of the anticipated future net salvage activity and is recommended in this study. Gannett Fleming recommends closely monitoring this account and making further decreases to the net salvage as needed in future studies.

As approved in Ontario Energy Board Decision XXXXX and as described in section “Estimation of Survivor Curves and Net Salvage Percentages” previously in this report, this study continues to utilize the Constant Dollar Net Salvage methodology. The previously approved traditional net salvage estimate of negative 45 percent was calculated as a constant dollar net salvage rate of negative 22 percent. The currently recommended traditional net salvage estimate of negative 100 percent will be implemented as a constant dollar net salvage percent of negative 34 percent.

Account 475.30 – Distribution – Mains – Plastic - represents 23% of the depreciable plant studied. The retirements, additions and other plant transactions for the period 1968 through 2016 were analyzed by the computed mortality and retirement rate method. The original life table as provided on pages V-33 and VI-34, and as plotted on page V-32, indicates only a minimal amount of plant retired to date. Therefore the Iowa curve fitting was not a major consideration in selecting the life and curve for this account.

Gannett Fleming relied largely on peer analysis in selecting an Iowa curve for this account. Peer gas distribution companies range from 64 years to 70 years. The the currently approved Iowa 65-R3 is within this range of peers.

Interviews with company management indicate that approximately 2% of the investment in this account relates to 1970's era plastic pipe. While this investment is expected to have a shorter life, it is not a major factor to determining the life of these assets. Consequently, Gannett Fleming asserts that this investment in the 1970's era plastics is not enough to justify shortening the life of this account.

As the Iowa 70-R4 is consistent with operational staff interviews, the Iowa 70-R4 is forecast to be representative of the anticipated future retirement activity and is recommended in this study.

A net salvage study is presented for this account on page VI-17 which reviewed the net salvage characteristics resulting from the retirement experience for a 15-year period from 2002 through 2016. Over this historic period, the company has incurred \$41.1 million to retire \$14.3 million of original cost of investment and has recovered less than \$1 million from the reuse of the assets or through sale proceeds. As such, this historic net salvage percentage of negative 286 percent is substantially more negative than the previously recommended negative 85 percent net salvage.

A net salvage percentage of negative 175 provides a reasonable representation of historical net salvage percentages and is consistent with operational staff interviews. Therefore a negative 175 percent is forecast to be representative of the anticipated future net salvage activity and is recommended in this study. Gannett Fleming recommends closely monitoring this account and making further adjustments to the net salvage percentage as needed in future studies.

As approved in Ontario Energy Board Decision X and as described in section "Estimation of Survivor Curves and Net Salvage Percentages" previously in this report, this study continues to utilize the Constant Dollar Net Salvage methodology. The previously approved traditional net salvage estimate of negative 85 percent was calculated as a constant dollar net salvage rate of negative 38 percent. The currently recommended traditional net salvage estimate of negative 175 percent will be implemented as a constant dollar net salvage percent of negative 34 percent.

Account 475.21 – Distribution – Mains – Coated Steel – represents 17% of the depreciable plant studied. The retirements, additions and other plant transactions for the period 1955 through 2016 were analyzed by the computed mortality and retirement rate methods. The original life table as provided on pages V-30 and V-31, and as plotted on page V-29, show consistent retirement ratios through the life of this account, indicating a lower mode curve.

The Iowa curve matching procedures employed by Gannett Fleming resulted in an Iowa 86-R2 being considered the best fit to the historic retirement trends with a residual measure of 0.55. The Iowa 86-R2 represents a substantially longer life estimate than the currently used Iowa 61-R3.

The operational staff discussions did not indicate any reason to believe that the plant currently in service should have any significant changes from the plant in service as of the currently approved rates. The maximum life of the statistical best fit Iowa 86-R2 is over 240 years. While the current retirement history fits the Iowa 86-R2 very well, it is not indicative of the future of this account.

Gannett Fleming interviews with Operations and Engineering staff have indicated that coated steel mains are primarily used within the Enbridge system on installations where pipe of 8 inches or greater diameter is required. It was also indicated that all coated steel mains within the system are protected with cathodic control systems. Consistent with the retirement rate analysis, the internal company experts felt that the currently approved 61-year average service life should be lengthened.

As the Iowa 70-R3 is consistent with operational staff interviews and the historic data, the Iowa 70-R3 is forecast to be representative of the anticipated future retirement activity. Consequently, an extension of the currently approved 61-year average service life to 70 years is reasonable.

A net salvage study is presented for this account on page VI-16 which reviewed the net salvage characteristics resulting from the retirement experience for a 15-year period from 2002 through 2016. Over this historic period, the company has incurred \$52.5 million to retire \$36.7 million of original cost of investment and has not made any recovery from the reuse of the assets or through sale proceeds. As such, this historic net salvage percentage of negative 143 percent far exceeds the previously recommended negative

90 percent. There have only been six years where the requirement for net salvage was less than negative 90 percent. A much more negative net salvage percentage is needed at this time to account for indicted historical net salvage requirements.

As the net salvage percentage of negative 150 provides a reasonable representation of historical net salvage percentages and is consistent with operational staff interviews, the percentage of negative 150 is forecast to be representative of the anticipated future net salvage activity and is recommended in this study.

As approved in **Ontario Energy Board Decision X** and as described in section “Estimation of Survivor Curves and Net Salvage Percentages” previously in this report, this study continues to utilize the Constant Dollar Net Salvage methodology. The previously approved traditional net salvage estimate of negative 90 percent was calculated as a constant dollar net salvage rate of negative 51 percent. The currently recommended traditional net salvage estimate of negative 150 percent will be implemented as a constant dollar net salvage percent of negative 41 percent.

Account 478.00 – Distribution - Meters - represents **14%** of the depreciable plant studied. The retirements, additions and other plant transactions for the period 1955 through 2016 were analyzed by the computed mortality and retirement rate method. The original life table as provided on pages V-41, V-42 and V-43, and as plotted on page VI-40, show consistent retirement ratios through the life of this account, indicating a lower mode curve.

Throughout the gas distribution industry there have been large technological and economic changes in metering accounts. The introduction of lower cost diaphragm meters means that it is no longer economically feasible to repair 80 percent to 90 percent of the meters in this account. Measurement Canada mandates that meters are tested at 12 years, then eight years and then seven years. Company management expects that all meters sampled will pass the first testing at 12 years, but less likely that they will pass the testing after this.

As the Iowa 15-S2.5 is consistent with operational staff interviews, peer comparable lives, and the technological and economical forces on the gas distribution industry, the Iowa 15-S2.5 is forecast to be representative of the anticipated future retirement activity and is recommended in this study.

A net salvage study is presented for this account on pages VI-2 and VI-23 which reviewed the net salvage characteristics resulting from the retirement experience for a 33-year period from 1983 through 2016. Over this historic period, the company has incurred less than \$1 million to retire \$146.9 million of original cost of investment and has recovered \$6.4 million from the reuse of the assets or through sale proceeds. As such, this historic net salvage percentage of positive 4 is in line with the previously recommended positive 5 percent net salvage.

As the net salvage percentage of positive 5 provides a good representation of historical net salvage percentages and is consistent with operational staff interviews, the percentage of positive 5 is forecast to be representative of the anticipated future net salvage activity and is recommended in this study.

Account 477.00 – Distribution – Measuring and Regulating Equipment - represents 5% of the depreciable plant studied. The retirements, additions and other plant transactions for the period 1949 through 2016 were analyzed by the computed mortality and retirement rate method. The original life table as provided on pages V-38 and V-39, and as plotted on page V-37 show a consistent rate of retirement through age 24.5, indicating a low mode curve.

The lowa curve matching procedures employed by Gannett Fleming resulted in an lowa 48-S0 being considered the best fit to the historic retirement trends with a residual measure of 1.03. The lowa 48-S0 represents a substantially longer life estimate than the currently used lowa 33-L1.5, which has a residual measure of 16.79. Peer Canadian gas distribution utilities have an lowa life ranging from 15 years to 45 years.

Interviews with company management indicate that an extension to the life of this account is reasonable, however the lowa curve of 48 years is beyond the expectation at this time. The lowa 42-R1.5 provides an excellent fit to the data through age 36.5 and a good fit through the historic life of this account, with a residual measure of 1.98.

As the lowa 42-R1.5 is consistent with operational staff interviews, peer Canadian gas distribution utilities, and historic indications, the lowa 42-R1.5 is forecast to be representative of the anticipated future retirement activity and is recommended in this study.

A net salvage study is presented for this account on pages VI-20 and VI-21 which

reviewed the net salvage characteristics resulting from the retirement experience for a 33-year period from 1983 through 2016. Over this historic period, the company has incurred \$11 million to retire \$75.3 million of original cost of investment and has recovered \$1.3 million from the reuse of the assets or through sale proceeds. As such, this historic net salvage percentage of negative 13 percent is more negative than the previously recommended negative 5 percent net salvage.

As the net salvage percentage of negative 10 provides a reasonable representation of historical net salvage percentages and is consistent with operational staff interviews, the percentage of negative 10 is forecast to be representative of the anticipated future net salvage activity and is recommended in this study. Gannett Fleming recommends closely monitoring this account and making further decreases to the net salvage as needed in future studies.

As approved in Ontario Energy Board Decision X and as described in section “Estimation of Survivor Curves and Net Salvage Percentages” previously in this report, this study continues to utilize the Constant Dollar Net Salvage methodology. The previously approved traditional net salvage estimate of negative five percent was calculated as a constant dollar net salvage rate of negative three percent. The currently recommended traditional net salvage estimate of negative 10 percent will be implemented as a constant dollar net salvage percent of negative three percent.

Account 456.00 – Underground Storage Plant – Compressor Equipment – represents 2% of the depreciable plant studied. The retirements, additions and other plant transactions for the period 1964 through 2016 were analyzed by the computed mortality and retirement rate method. The original life table as provided on pages V-15 and V-16, and as plotted on page V-14 indicates only a minimal amount of plant retired to date.

Interviews with company management indicate that an extension to the life of this account is reasonable at this time. The currently approved Iowa 40-R2 is not a good fit to the historical data, nor does it represent the expectations of company management.

As the Iowa 45-R3 is consistent with operational staff interviews, and historic indications, the Iowa 45-R3 is forecast to be representative of the anticipated future

retirement activity and is recommended in this study. This account will require careful monitoring and may need to have a further life extension in future studies.

Interviews with company management indicate that a small amount of negative net salvage is reasonable at this time. Currently, EGDI is using a negative five percent net salvage rate. This is considered to be reasonable for future retirements.

Account 491.03 – CIS Software Acquired– represents 2% of the depreciable plant studied. This account contains major software applications purchased from outside vendors, such as the Oracle System. These systems are major investments and are not updated regularly. Peer Canadian gas distribution utilities use 10 years for major software accounts. Conversations with company management indicated that a 10-year life is reasonable for this account.

Account 472.00 – Distribution – Structures and Improvements - represents 2% of the depreciable plant studied. The retirements, additions and other plant transactions for the period 1948 through 2016 were analyzed by the computed mortality and retirement rate method. The original life table as provided on pages V-23 and V-24, and as plotted on page V-22, show consistent retirement ratios through the life of this account, indicating a lower mode curve.

Enbridge Gas Distribution currently uses Iowa 60-S1.5 for major buildings and Iowa 45-R1 for other buildings. Conversations with company management indicated that it would be appropriate to give all assets in this account the same Iowa curve. A number of buildings are reaching the end of their useful life and will require replacement in the very near future. The Kennedy, Ottawa Office and Ottawa Depot buildings in particular will need to be replaced as soon as possible.

The Iowa curve matching procedures employed by Gannett Fleming resulted in an Iowa 40-R1 being considered the best fit to the historic retirement trends with a residual measure of 3.55. This is far shorter than the expectation of internal company management and not an appropriate life at this time. The Iowa 40-R1 represents a substantially shorter life estimate than the currently used Iowa 45-R1, which has a residual measure of 7.84, and Iowa 60-S1.5 which has a residual measure of 23.18. Peer Canadian gas distribution utilities have an Iowa life ranging from 36 years to 70 years.

Iowa 50-R1 is an excellent fit to the data through age 36 and a good fit to the data for the remainder of the life, with a residual measure of 10.87.

As the Iowa 50-R1 is consistent with operational staff interviews, peer comparables, and historic data, the Iowa 50-R1 is forecast to be representative of the anticipated future retirement activity and is recommended in this study.

A net salvage study is presented for this account on pages VI-10 and VI-11 which reviewed the net salvage characteristics resulting from the retirement experience for a 33-year period from 1983 through 2016. Over this historic period, the company has incurred less than \$15 million to retire \$102 million of original cost of investment and has recovered less than \$1 million from the reuse of the assets or through sale proceeds. As such, this historic net salvage percentage of negative 15 is substantially lower previously recommended positive 20 percent net salvage. Peer Canadian gas distribution companies have net salvage estimates ranging from negative 10 through negative 40 percent.

As the net salvage percentage of negative 15 provides a good representation of historical net salvage percentages and is consistent with operational staff interviews, the percentage of negative 15 is forecast to be representative of the anticipated future net salvage activity and is recommended in this study.

Account 455.00 – Underground Storage Plant – Field Lines - represents 1.5% of the depreciable plant studied. The retirements, additions and other plant transactions for the period 1963 through 2016 were analyzed by the computed mortality and retirement rate method. The original life table as provided on pages V-12 and V-13, and as plotted on page V-11, show minimal retirements to date for this account.

The Iowa curve matching procedures employed by Gannett Fleming resulted in the currently approved Iowa 55-R3, which has a residual measure of 12.22, being considered too short. Iowa 60-R4 is an excellent fit to the data through age 35 and a good fit to the data for the remainder of the life, with a residual measure of 5.70.

As the Iowa 60-R4 is consistent with operational staff interviews and historic data, the Iowa 60-R4 is forecast to be representative of the anticipated future retirement activity and is recommended in this study.

A net salvage study is presented for this account on pages VI-4 and VI-5 which

reviewed the net salvage characteristics resulting from the retirement experience for a 20-year period from 1996 through 2016. Over this historic period, the company has incurred \$1.9 million to retire \$1.5 million of original cost of investment and has recovered less than \$1 million from the reuse of the assets or through sale proceeds. As such, this historic net salvage percentage of negative 121 is substantially lower previously recommended negative five percent net salvage.

As the net salvage percentage of negative 25 provides a good representation of historical net salvage percentages and is consistent with operational staff interviews, the percentage of negative 25 is forecast to be representative of the anticipated future net salvage activity and is recommended in this study.

Account 491.02 – Software - Developed– represents 1% of the depreciable plant studied. This account contains minor software applications, developed in house. Peer Canadian gas distribution utilities use five years for minor software accounts. Conversations with company management indicated that a five-year life is reasonable for this account.

Account 453.00 – Underground Storage Plant - represents 1% of the depreciable plant studied. The retirements, additions and other plant transactions for the period 1963 through 2016 were analyzed by the computed mortality and retirement rate method. The original life table as provided on pages V-6 and V-7 and as plotted on page V-5, show consistent retirement ratios through the life of this account, indicating a lower mode curve.

The lowa curve matching procedures employed by Gannett Fleming resulted in an lowa 60-S0 being considered the best fit to the historic retirement trends with a residual measure of 1.57. The lowa 60-S0 represents a substantially longer life estimate than the currently used lowa 45-R3, which has a residual measure of 8.44. lowa 50-R2 is a good fit to the data with a residual measure of 3.34.

As the lowa 50-R2 is consistent with operational staff interviews and historic data, the lowa 50-R2 is forecast to be representative of the anticipated future retirement activity and is recommended in this study.

A net salvage study is presented for this account on pages VI-2 and VI-3 which reviewed the net salvage characteristics resulting from the retirement experience for a 22-year period from 1994 through 2016. Over this historic period, the company has

incurred \$33.8 million to retire \$7.9 million of original cost of investment and has not made any recovery from the reuse of the assets or through sale proceeds. As such, this historic net salvage percentage of negative 427 is substantially lower previously recommended negative 10 percent net salvage.

As the net salvage percentage of negative 20 provides a good representation of historical net salvage percentages and is consistent with operational staff interviews, the percentage of negative 20 is forecast to be representative of the anticipated future net salvage activity and is recommended in this study.

IMPACT OF RECENT GOVERNMENT OF ONTARIO CARBON REDUCTION INITIATIVES

On June 8th, 2016, the Office of the Ontario Premier Kathleen Wynne released its plan for a “low-carbon future” in its “Climate Change Action Plan”.² The action plan outlines Ontario’s plan to begin phasing out natural gas for heating by providing incentives to retrofit buildings. The action plan provides a backbone of the province’s strategy to cut emissions to 15 per cent below 1990 levels by 2020, 37 per cent by 2030 and 80 per cent by 2050³. Specifically the action plan provides for:

- \$3.8-billion for new grants, rebates and other subsidies to retrofit buildings, and move them off natural gas and onto geothermal, solar power or other forms of electric heat.
- New building code rules that will require all homes and small buildings built in 2030 or later to be heated without using fossil fuels, such as natural gas. This will be expanded to all buildings before 2050.

The above initiatives will have a profound impact on the utilization of the EGDI system assets by the year 2050, and as early as 2020. The action plan anticipates that cutting natural gas, which currently provides 76 per cent of Ontario’s heating, will require mass adoption of green technologies in buildings across the province. The plan lists geothermal systems, air heat pumps and rooftop solar panels as technologies that will be

²News Release of the Office of the Ontario Premier titled “Ontario Releases New Climate Change Action Plan”.

³Climate Change Action Plan, page 13.

eligible for rebates. The action plan also anticipates that the initiatives could also require an expansion of the electricity grid and promises to subsidize any increased electricity costs for homeowners.

Clearly, with these initiatives, the future growth and retirement programs of the EGD system may be significantly different than the retirement patterns witnessed in the past. While future retirements that are caused by physical forces of retirement such as wear and tear and changes in technology of the assets will continue, it is reasonable to anticipate that the utilization of large groups of assets will change due to the implementation of the Ontario Climate Change Action Plan. Consistent with the reduction in the utilization of the assets, it could be assumed that large scale retirement of assets may be required in the periods between now and 2050.

Common depreciation practice is to deal with the anticipated large scale retirements through the introduction of a Life Span date within the depreciation rate calculations⁴. However, at this time the future impacts of the Climate Change Action Plan have not been sufficiently studied, nor have specific programs been put into place that would provide the indications of the changes in the utilization levels. Gannett Fleming views that additional study of the changes are required before the introduction of a Life Span date for the EGD system into the depreciation rate calculations which will cause a significant increase in the depreciation rate. However, Gannett Fleming notes that future depreciation studies of the EGD system will require the introduction of a Life Span into the depreciation rate calculations.

⁴ For example, National Energy Board Decision RH-003-2011 relating to a Re-Structuring Application by TransCanada Pipelines Ltd.

**PART III. CALCULATION OF ANNUAL AND
ACCRUED DEPRECIATION**

PART III. CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

CALCULATION OF ANNUAL AND ACCRUED DEPRECIATION

Group Depreciation Procedures

When more than a single item of property is under consideration, a group procedure for depreciation is appropriate because normally all of the items within a group do not have identical service lives, but have lives that are dispersed over a range of time. There are two primary group procedures, namely, Average Service Life (ASL) and Equal Life Group (ELG).

In the ELG procedure, the property group is subdivided according to service life. That is, each equal life group includes that portion of the property which experiences the life of that specific group. The relative size of each equal life group is determined from the property's life dispersion curve. The calculated depreciation for the property group is the summation of the calculated depreciation based on the service life of each equal life group.

CALCULATION OF ANNUAL AND ACCRUED AMORTIZATION

Amortization is the gradual extinguishment of an amount in an account by distributing such amount over a fixed period, over the life of the asset or liability to which it applies, or over the period during which it is anticipated the benefit will be realized. Normally, the distribution of the amount is in equal amounts to each year of the amortization period.

The calculation of annual and accrued amortization requires the selection of an amortization period. The amortization periods used in this report were based on judgment which incorporated a consideration of the period during which the assets will render most of their service, the amortization period and service lives used by other utilities, and the service life estimates previously used for the asset under depreciation accounting.

Amortization accounting is proposed for a number of accounts that represent numerous units of property, but a very small portion of depreciable gas distribution and general plant in service. The accounts and their amortization periods are as follows:

<u>ACCOUNT</u>	<u>TITLE</u>	AMORTIZATION PERIOD, <u>YEARS</u>
475.00	Distribution – Mains – Envision	25
483.00	General Plant - Office Furnishings and Equipment	12
486.00	General Plant – Tools and Work Equipment	15
487.70	General Plant – Rental – VRA’s	20
487.80	General Plant – Rental – NGV Station	20
488.00	General Plant – Communication Equipment	10
490.00	Computer Equipment	5
491.01	Software – Acquired	4
491.02	Software – Developed	5
491.03	CIS Software – Acquired	10

For the purpose of calculating annual amortization amounts as of December 31, 2016, the book depreciation reserve for each plant account or subaccount is assigned or allocated to vintages. The book reserve assigned to vintages with an age greater than the amortization period is equal to the vintage’s original cost. The remaining book reserve is allocated among vintages with an age less than the amortization period in proportion to the calculated accrued amortization. The calculated accrued amortization is equal to the original cost multiplied by the ratio of the vintage’s age to its amortization period. The annual amortization amount is determined by dividing the future amortizations (original cost less allocated book reserve) by the remaining period of amortization for the vintage.

Remaining Life Annual Accruals

In the average service life procedure, the remaining life annual accrual for a property group is determined by dividing future book accruals (original cost less book reserve less net salvage) by the average (or composite) remaining life. The average remaining life for a property group is the weighted average of the average remaining lives for each vintage. The average remaining life for each vintage is a direct weighted average

derived from the estimated future survivor curve in accordance with the average service life procedure.

The calculated accrued depreciation for each depreciable property group represents that portion of the depreciable cost of the group which would not be allocated to expense through future depreciation accruals if current forecasts of life characteristics are used as the basis for such accruals. The accrued depreciation calculation consists of applying an appropriate ratio to the surviving original cost of each vintage of each account based upon the attained age and service life. The straight line accrued depreciation ratios are calculated as follows for the average service life procedure:

$$\text{Ratio} = 1 - \frac{\text{Average Remaining Life}}{\text{Average Service Life}}$$

PART IV. RESULTS OF STUDY

PART IV. RESULTS OF STUDY

QUALIFICATION OF RESULTS

The calculated annual and accrued depreciation are the principal results of the study. Continued surveillance and periodic revisions are normally required to maintain continued use of appropriate annual depreciation accrual rates. An assumption that accrual rates can remain unchanged over a long period of time implies a disregard for the inherent variability in service lives and salvage and for the change of the composition of property in service. The annual accrual rates and the accrued depreciation were calculated in accordance with the straight line method, using the equal life group procedure based on estimates which reflect considerations of current historical evidence and expected future conditions.

DESCRIPTION OF DETAILED TABULATIONS

The service life estimates were based on judgment that incorporated statistical analysis of retirement data, discussions with management and consideration of estimates made for other gas distribution utilities. The results of the statistical analysis of service life are presented in the section beginning on page V-2 of this report.

For each depreciable group analyzed by the retirement rate method, a chart depicting the original and estimated survivor curves followed by a tabular presentation of the original life table(s) plotted on the chart. The survivor curves estimated for the depreciable groups are shown as dark smooth curves on the charts. Each smooth survivor curve is denoted by a numeral followed by the curve type designation. The numeral used is the average life derived from the entire curve from 100 percent to zero percent surviving. The titles of the chart indicate the group, the symbol used to plot the points of the original life table, and the experience and placement bands of the life tables which were plotted. The experience band indicates the range of years for which retirements were used to develop the stub survivor curve. The placements indicate, for the related experience band, the range of years of installations which appear in the experience.

The tables of the calculated annual depreciation applicable to depreciable assets as of December 31, 2016 are presented in account sequence starting on page VII-2 of

the supporting documents. The tables indicate the estimated average survivor curves used in the calculations. The tables set forth, for each installation year, the original cost, calculated accrued depreciation, and the calculated annual accrual.

APPENDIX A
ESTIMATION OF SURIVOR CURVES

ESTIMATION OF SURVIVOR CURVES

Average Service Life

The use of an average service life for a property group implies that the various units in the group have different lives. Thus, the average life may be obtained by determining the separate lives of each of the units, or by constructing a survivor curve by plotting the number of units which survive at successive ages. A discussion of the general concept of survivor curves is presented. Also, the Iowa type survivor curves are reviewed.

SURVIVOR CURVES

The survivor curve graphically depicts the amount of property existing at each age throughout the life of an original group. From the survivor curve, the average life of the group, the remaining life expectancy, the probable life, and the frequency curve can be calculated. In Figure 1, a typical smooth survivor curve and the derived curves are illustrated. The average life is obtained by calculating the area under the survivor curve, from age zero to the maximum age, and dividing this area by the ordinate at age zero. The remaining life expectancy at any age can be calculated by obtaining the area under the curve, from the observation age to the maximum age, and dividing this area by the percent surviving at the observation age. For example, in Figure 1, the remaining life at age 30 is equal to the crosshatched area under the survivor curve divided by 29.5 percent surviving at age 30. The probable life at any age is developed by adding the age and remaining life. If the probable life of the property is calculated for each year of age, the probable life curve shown in the chart can be developed. The frequency curve presents the number of units retired in each age interval. It is derived by obtaining the differences between the amount of property surviving at the beginning and at the end of each interval.

Iowa Type Curves

The range of survivor characteristics usually experienced by utility and industrial properties is encompassed by a system of generalized survivor curves known as the

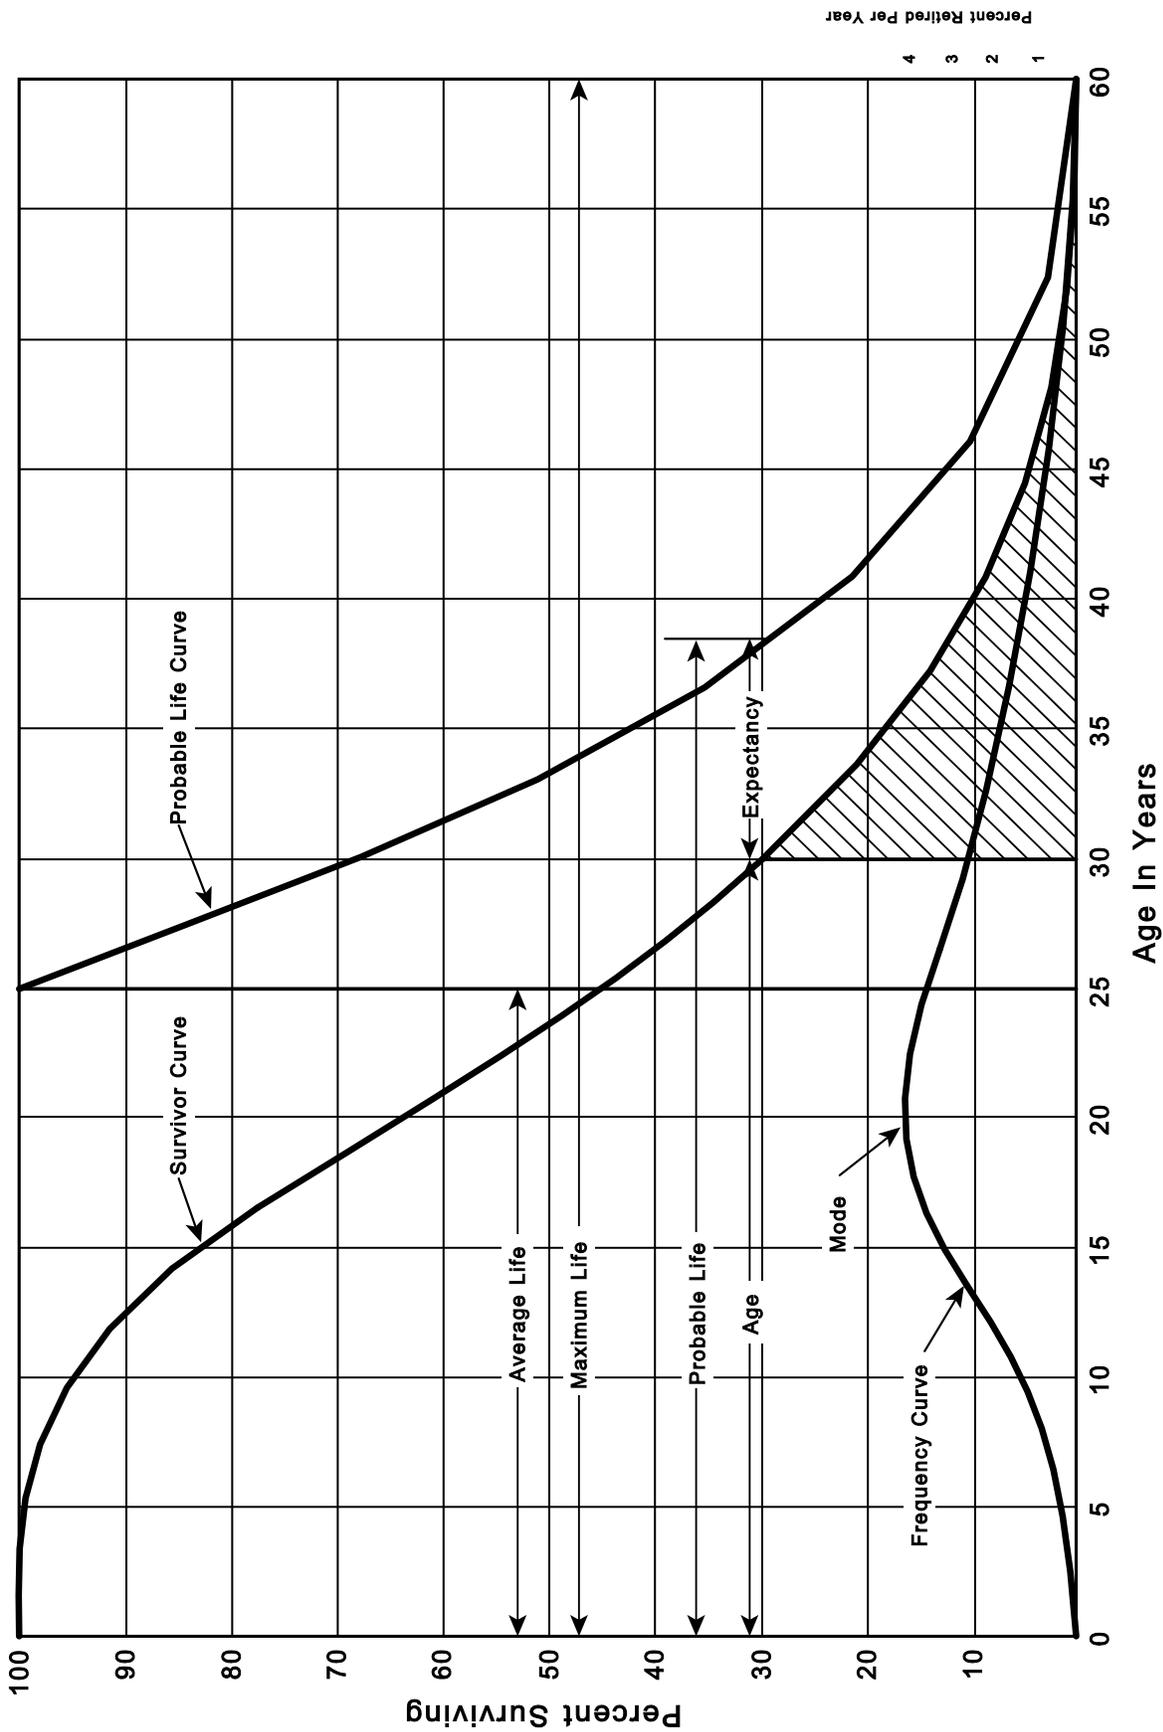

Figure 1. A Typical Survivor Curve and Derived Curves

Iowa type curves. There are four families in the Iowa system, labeled in accordance with the location of the modes of the retirements in relationship to the average life and the relative height of the modes. The left moded curves, presented in Figure 2, are those in which the greatest frequency of retirement occurs to the left of, or prior to, average service life. The symmetrical moded curves, presented in Figure 3, are those in which the greatest frequency of retirement occurs at average service life. The right moded curves, presented in Figure 4, are those in which the greatest frequency occurs to the right of, or after, average service life. The origin moded curves, presented in Figure 5, are those in which the greatest frequency of retirement occurs at the origin, or immediately after age zero. The letter designation of each family of curves (L, S, R or O) represents the location of the mode of the associated frequency curve with respect to the average service life. The numbers represent the relative heights of the modes of the frequency curves within each family.

The Iowa curves were developed at the Iowa State College Engineering Experiment Station through an extensive process of observation and classification of the ages at which industrial property had been retired. A report of the study which resulted in the classification of property survivor characteristics into 18 type curves, which constitute three of the four families, was published in 1935 in the form of the Experiment Station's Bulletin 125.¹ These curve types have also been presented in subsequent Experiment Station bulletins and in the text, "Engineering Valuation and Depreciation."² In 1957, Frank V. B. Couch, Jr., an Iowa State College graduate student, submitted a thesis³ presenting his development of the fourth family consisting of the four O type survivor curves.

Retirement Rate Method of Analysis

The retirement rate method is an actuarial method of deriving survivor curves using the average rates at which property of each age group is retired. The method relates to property groups for which aged accounting experience is available and is the method used to develop the original stub survivor curves in this study. The method (also known as the annual rate method) is illustrated through the use of an example in the following text, and is also explained in several publications, including "Statistical Analyses of Industrial Property Retirements,"⁴ "Engineering Valuation and Depreciation,"⁵ and "Depreciation Systems."⁶

The average rate of retirement used in the calculation of the percent surviving for the survivor curve (life table) requires two sets of data: first, the property retired during a period of observation, identified by the property's age at retirement; and second, the property exposed to retirement at the beginning of the age intervals during the same period. The period of observation is referred to as the experience band, and the band of years which represent the installation dates of the property exposed to retirement during the experience band is referred to as the placement band. An example of the calculations used in the development of a life table follows. The example includes schedules of annual aged property transactions, a schedule of plant exposed to retirement, a life table and illustrations of smoothing the stub survivor curve.

Schedules of Annual Transactions in Plant Records

The property group used to illustrate the retirement rate method is observed for the experience band 2007-2016 during which there were placements during the years 2007-2016. In order to illustrate the summation of the aged data by age interval, the data were compiled in the manner presented in Schedules 1 and 2 on the following pages. In Schedule 1, the year of installation (year placed) and the year of retirement are shown. The age interval during which a retirement occurred is determined from this information. In the example which follows, \$10,000 of the dollars invested in 2002 were

 Parentheses Denote Credit Amount.

retired in 2007. The \$10,000 retirement occurred during the age interval between 4½ and 5½ years on the basis that approximately one-half of the amount of property was installed prior to and subsequent to July 1 of each year. That is, on the average, property installed during a year is placed in service at the midpoint of the year for the purpose of the analysis. All retirements also are stated as occurring at the midpoint of a one-year age interval of time, except the first age interval which encompasses only one-half year.

The total retirements occurring in each age interval in a band are determined by summing the amounts for each transaction year-installation year combination for that age interval. For example, the total of \$143,000 retired for age interval 4½-5½ is the sum of the retirements entered on Schedule 1 immediately above the stair step line drawn on the table beginning with the 2007 retirements of 2002 installations and ending with the 2016 retirements of the 2011 installations. Thus, the total amount of 143 for age interval 4½-5½ equals the sum of:

$$10 + 12 + 13 + 11 + 13 + 13 + 15 + 17 + 19 + 20.$$

In Schedule 2, other transactions which affect the group are recorded in a similar manner. The entries illustrated include transfers and sales. The entries which are credits to the plant account are shown in parentheses. The items recorded on this schedule are not totaled with the retirements, but are used in developing the exposures at the beginning of each age interval.

Schedule of Plant Exposed to Retirement

The development of the amount of plant exposed to retirement at the beginning of each age interval is illustrated in Schedule 3 on the following page. The surviving plant at the beginning of each year from 2007 through 2016 is recorded by year in the portion of the table headed "Annual Survivors at the Beginning of the Year." The last amount entered in each column is the amount of new plant added to the group during the year. The amounts entered in Schedule 3 for each successive year following the beginning balance or addition, are obtained by adding or subtracting the net entries

^a Additions during the year.

shown on Schedules 1 and 2. For the purpose of determining the plant exposed to retirement, transfers-in are considered as being exposed to retirement in this group at the beginning of the year in which they occurred, and the sales and transfers-out are considered to be removed from the plant exposed to retirement at the beginning of the following year. Thus, the amounts of plant shown at the beginning of each year are the amounts of plant from each placement year considered to be exposed to retirement at the beginning of each successive transaction year. For example, the exposures for the installation year 2006 are calculated in the following manner:

Exposures at age 0	= amount of addition	= \$750,000
Exposures at age ½	= \$750,000 - \$ 8,000	= \$742,000
Exposures at age 1½	= \$742,000 - \$18,000	= \$724,000
Exposures at age 2½	= \$724,000 - \$20,000 - \$19,000	= \$685,000
Exposures at age 3½	= \$685,000 - \$22,000	= \$663,000

For the entire experience band 2006-2015, the total exposures at the beginning of an age interval are obtained by summing diagonally in a manner similar to the summing of the retirements during an age interval (Schedule 1). For example, the figure of 3,789, shown as the total exposures at the beginning of age interval 4½-5½, is obtained by summing:

$$255 + 268 + 284 + 311 + 334 + 374 + 405 + 448 + 501 + 609.$$

Original Life Table

The original life table, illustrated in Schedule 4 on the following page, is developed from the totals shown on the schedules of retirements and exposures, Schedules 1 and 3, respectively. The exposures at the beginning of the age interval are obtained from the corresponding age interval of the exposure schedule, and the retirements during the age interval are obtained from the corresponding age interval of the retirement schedule. The retirement ratio is the result of dividing the retirements during the age interval by the exposures at the beginning of the age interval. The percent surviving at the beginning of each age interval is derived from survivor ratios, each of which equals one minus the retirement ratio. The percent surviving is developed by starting with 100% at age zero and successively multiplying the percent

					35.66
Total	<u>44,780</u>	<u>1,606</u>			

Column 2 from Schedule 3, Column 12, Plant Exposed to Retirement.

Column 3 from Schedule 1, Column 12, Retirements for Each Year.

Column 4 = Column 3 divided by Column 2.

Column 5 = 1.0000 minus Column 4.

Column 6 = Column 5 multiplied by Column 6 as of the Preceding Age Interval.

surviving at the beginning of each interval by the survivor ratio, i.e., one minus the retirement ratio for that age interval. The calculations necessary to determine the percent surviving at age 5½ are as follows:

Percent surviving at age 4½	=	88.15	
Exposures at age 4½	=	3,789,000	
Retirements from age 4½ to 5½	=	143,000	
Retirement Ratio	=	143,000 ÷ 3,789,000	= 0.0377
Survivor Ratio	=	1.000 - 0.0377	= 0.9623
Percent surviving at age 5½	=	(88.15) x (0.9623)	= 84.83

The totals of the exposures and retirements (columns 2 and 3) are shown for the purpose of checking with the respective totals in Schedules 1 and 3. The ratio of the total retirements to the total exposures, other than for each age interval, is meaningless. The original survivor curve is plotted from the original life table (column 6, Schedule 4). When the curve terminates at a percent surviving greater than zero, it is called a stub survivor curve. Survivor curves developed from retirement rate studies generally are stub curves.

Smoothing the Original Survivor Curve

The smoothing of the original survivor curve eliminates any irregularities and serves as the basis for the preliminary extrapolation to zero percent surviving of the original stub curve. Even if the original survivor curve is complete from 100% to zero percent, it is desirable to eliminate any irregularities, as there is still an extrapolation for the vintages which have not yet lived to the age at which the curve reaches zero percent. In this study, the smoothing of the original curve with established type curves was used to eliminate irregularities in the original curve.

The Iowa type curves are used in this study to smooth those original stub curves which are expressed as percents surviving at ages in years. Each original survivor curve was compared to the Iowa curves using visual and mathematical matching in order to determine the better fitting smooth curves. In Figures 6, 7, and 8, the original curve developed in Schedule 4 is compared with the L, S, and R Iowa type curves which most nearly fit the original survivor curve. In Figure 6, the L1 curve with an

average life between 12 and 13 years appears to be the best fit. In Figure 7, the S0 type curve with a 12-year average life appears to be the best fit and appears to be better than the L1 fitting. In Figure 8, the R1 type curve with a 12-year average life appears to be the best fit and appears to be better than either the L1 or the S0.

In Figure 9, the three fittings, 12-L1, 12-S0 and 12-R1 are drawn for comparison purposes. It is probable that the 12-R1 lowa curve would be selected as the most representative of the plotted survivor characteristics of the group.

APPENDIX B
ESTIMATION OF NET SALVAGE

ESTIMATION OF NET SALVAGE

The estimates of net salvage were based primarily on the professional judgment of Gannett Fleming, in part on historical data, and in part through a comparison to peer companies. Gross salvage and cost of removal as recorded to the depreciation reserve account and related to experienced retirements are used. Percentages of the cost of plant retired are calculated for each component of net salvage on both annual and three-year moving average bases.

The net salvage percentages estimated is usually determined using the “Traditional Approach” for net salvage estimation. When a utility retires plant, the plant may be: (1) sold to a third party; (2) reused by the utility for additional service; (3) abandoned in place; or (4) physically removed. In the circumstances where the plant is sold or re-used, a salvage proceed (or positive salvage amount) is normally recognized. In circumstances where the plant is abandoned in place or physically removed, a cost of removal expenditure (or negative salvage) is incurred. The net of these estimated gross salvage proceeds and the estimated costs of removal are expressed as a percentage of the account’s original cost to determine a net salvage percentage. In the circumstances where the salvage proceeds exceed the costs of retirement, a net positive salvage percentage exists. In the circumstances where the costs of removal exceed the salvage proceeds, a net negative salvage percentage results.

The estimation of the net salvage percentages developed using the traditional approach, includes the following steps:

1. The annual retirement, gross salvage and cost of removal transactions for the period of analysis are extracted from the plant accounting systems.
2. A net salvage amount (gross salvage proceeds less cost of retirement) is calculated for each historic year. Additionally, a net salvage amount is also calculated for each historic three-year rolling band and the most recent five-year rolling band.
3. The net salvage amount determined above is compared to the original booked costs retired for each period in the manner described, which results in a net salvage percentage of original costs retired for each year, in addition to three-year rolling bands and the most recent five-year rolling band.

4. The annual, the three-year rolling average, and the most recent five-year rolling average net salvage percentages are analyzed to determine a reasonable estimated net salvage percentage. At this point the net salvage percentage is based purely upon statistical analysis.
5. Each account is then compared to the net salvage percentage currently approved, compared to peer companies, and discussed with company engineering staff. Based on the statistical analysis, the review of current and peer company net salvage percentages, and with the professional judgment of Gannett Fleming, a net salvage percentage is determined for each account.
6. The net salvage percentage is then used in the depreciation rate calculations in the technical update.

500 Consumer Road
North York, Ontario
Canada M2J 1P8

Attention: Steven Riccio
Supervisor Capital Management

Dear Steven;

Pursuant to your request, we have conducted a review and produced an independent written evaluation of depreciation for three of Enbridge's Gas Distribution initiatives (Geothermal, Renewable Natural Gas and Power Gas/Hydrogen Blending Pipeline) that can be included in regulatory filing submissions to the Ontario Energy Board (Rule 13A of the Board Rules and Statutory Declaration). Our evaluation report presents a description of the methods used in the estimation of service life, as well as our recommendations for average service life estimates.

We gratefully acknowledge the assistance of Enbridge personnel in the completion of the review.

Should you have any questions or concerns, please do not hesitate to contact me directly at 587.997.6489

Yours truly,

Concentric Advisors, ULC

SECTION 1

1 STUDY HIGHLIGHTS

Pursuant to request of Enbridge Gas Distribution Inc. (“Enbridge” or the “Company”), Concentric Advisors ULC (“Concentric”) completed an independent written evaluation of required componentization and related depreciation rates for three of Enbridge’s Gas Distribution initiatives (Geothermal, Renewable Natural Gas and Power to Gas (PtG)). It is understood that these projects will be considered for potential inclusion in regulatory filing submissions to the Ontario Energy Board (Rule 13A of the Board Rules and Statutory Declaration).

In conducting this review, Concentric discussed each of the three projects with the Company’s internal proponents, reviewed the depreciation parameters for similar projects of other regulated utilities, and reviewed industry literature regarding the background and theoretical concepts regarding these projects.

As described herein, a significant portion of the accounts for the Renewable Natural Gas Project

(“RNG”) fit within the current account structure for natural gas utilities. Concentric however does recommend the separation of the assets related to the RNG into new accounts.

Concentric also recommends a series of new accounts for the Power to Gas (“PtG”) and Geothermal projects.

The determination of the recommended depreciation rates for all three projects were calculated based on the Average Life Group (“ALG”) procedure, determined on remaining life basis, with a small provision of net negative salvage. This depreciation method is consistent with Enbridge’s current Ontario Energy Board approved depreciation practices.

A summary is provided below of the recommended depreciation rates, by component, for each of the three projects:

ENBRIDGE GAS DISTRIBUTION INC.
Summary of Proposed Depreciation Rates for New Technology Projects

Account	Depreciation Rate (%)	Account	Depreciation Rate (%)	Account	Depreciation Rate (%)
Renewable Natural Gas		Power to Gas		Geothermal	
Buildings and Structures	2.75	Buildings and Structures	2.75	Heat loops	2.00
Piping	2.75	Rectifier and Equipment	4.20	Pumps	5.00
Compression	4.20	Proton Exchange Membrane Electrolyser	5.25	Other	5.00
Metering Equipment	5.25	Other Electrical Equipment	4.20		
Scrubbing Equipment and Vessels	4.20	Fuel Cells	7.33		
Purification Equipment and Vessels	4.20	Hydrogen Gas Module and Enclosure	5.25		
Control Equipment	6.67	Water System and Storage Tank	5.25		
		Control Equipment	6.67		

SECTION 2

2 BASIS OF THE STUDY

2.1 Scope

Concentric has been retained by Enbridge to develop appropriate depreciation rates for three new projects related to the introduction of new technology to reduce Enbridge's carbon footprint. This study defines the methods and judgments which underlie the recommended componentization and annual depreciation accrual rates related to each of the three initiatives. The annual depreciation accruals rate rates and amounts are based on the straight-line, remaining life method of depreciation.

2.2 Information Provided by Enbridge

Concentric met with Enbridge staff responsible for the development of each of the three initiatives reviewed in this report. The information provides an overview of each project, the technology employed within each project and the manner in which each initiative would be employed within the Enbridge distribution system. Concentric notes that the Renewable Natural Gas and the Geothermal projects are based on technology that has been tested by a number of utilities throughout Canada. As such, Concentric has experience and information related to a number of such projects. However, the Power to Gas initiative is unique to the experience of the depreciation practice of Concentric. Additional industry information was therefore provided by Enbridge to Concentric in order for appropriate componentization and depreciation parameters to be developed.

2.3 Depreciation

An appropriate depreciation rate, for new technology assets introduced into the rate base of publicly regulated utility assets, includes review and determination of the following components:

- determination of the appropriate level of componentization for the investment being reviewed;
- determination of the appropriate average service life for each account (component);
- recommendations regarding estimated Net Salvage requirements for each account;
- determination of an appropriate depreciation method procedure; and
- a document explaining the procedures followed and justifying the results in a format suitable for submission to senior management and regulatory authorities.

SECTION 3

3 DEVELOPMENT OF THE REQUIRED DEPRECIATION RATES

3.1 Determination of Appropriate Level of Componentization**3.1.1 Renewable Natural Gas (“RNG”)**

Throughout North America, RNG projects (similar in nature to BioGas projects) have been developed by regulated utilities. As such, there is a group of accounts that are widely used for RNG facilities that have resulted in a reasonable level of componentization. Generally, the projects include:

- the collection of a BioGas (usually from landfills and water treatment plants);
- scrubbing and purification of BioGas to meet distribution pipeline standards;
- compressing the scrubbed gas to pipeline injection pressures; and
- metering and injection of the scrubbed gas into the pipeline system.

Discussions with Enbridge operating staff indicated that the proposed facilities are similar in nature and technology to other Canadian RNG projects. As such, the account structure as outlined in Section 3.2.1 of this report, are considered to be consistent with both the technology being used by Enbridge in this project and with the componentization of other Canadian RNG projects.

3.1.2 Power to Gas (“PtG”)

PtG is an energy conversion and storage option using electrolysis. It integrates renewable sources of generation, converts surplus electricity to produce hydrogen or renewable gas, and leverages the attributes of existing natural gas infrastructure including the transport of energy and seasonal storage. PtG provides the means to both store and transport energy. By blending hydrogen or substitute natural gas in the existing natural gas pipeline network the blended gas will be available for use throughout the pipeline system on demand. In effect the natural gas system serves as a ‘Power by Pipes’ alternative to the transmission grid to alleviate network congestion and transport energy. Separating the storage and discharge of energy results in a higher overall integrated energy system efficiency.¹

As the Concentric depreciation practice has not previously provided depreciation recommendations for PtG facilities, Concentric asked that Enbridge provide project information, including technical process summaries. In addition to operational interviews with Enbridge staff, Concentric conducted industry research that provided background to this technology, which has been developing at a rapid rate since the first large scale introductions in Europe, in 2013. A significant number of technical papers outlining the process and successes of this expertise aided Concentric in developing a background on this technology. The information was gathered and a preliminary set of componentized accounts was reviewed by Enbridge staff and Concentric’s “Utility of the Future” group. Based on these reviews, the account structure was refined resulting in the accounts as described in Section 3.2.2 of this report.

¹ Based on information from Hydrogenics Website
Concentric Advisors, ULC

3.1.3 Geothermal

Geothermal installations have been used in both the private and utility sectors for many years. The technology is mature and the major asset components are well defined. In the circumstances of the Enbridge proposal, the Company will own the heat loops including the pipe and casings, and the heat pumps. It is anticipated that the heat loops could be installed vertically or horizontal, based on site specific considerations. Given the portion of the system to be owned by Enbridge, Concentric views that three accounts are required:

- heat loops and associated installation costs;
- the heat pumps required to maintain a flow rate through the heat loops; and
- other equipment required at the geothermal site.

3.2 Determination of Average Service Life and Net Salvage Percentages

3.2.1 Renewal Natural Gas

The average service life and net salvage parameters were selected by Concentric based on a review of peer systems within Canada, and in consultation with Enbridge to understand the specific company installation. In some accounts, similar asset installations are widely used within natural gas installations. In these circumstances, a broader review of the approved average service life estimates was also considered. A peer analysis of the RNG installations within Canada is provided as Table 1 in the Results of the Study (Section 4) of this report.

The following is an account by account discussion of the specific recommendations.

3.2.1.1 Building and Structures

Includes compression and control equipment structures and improvements. This account should also include all site preparation (grading, gravel, etc.), fencing and security. A review of peer RNG installations for this account indicate average service life estimates of between 25 to 40 years. It is also noted that Building and Structures accounts, within natural gas distribution companies, range for 40 to 65 years, with Enbridge having an approved 60-year life on distribution system assets and 45 years on the underground storage assets.

Although RNG is becoming increasingly common, it is still a relatively new technology for natural gas distribution companies. As such Concentric views that the average service life should not exceed the longest life of peer group. Considering the peer group of the RNG assets, and the natural gas distribution system assets, including Enbridge, Concentric views that a 40-year life is reasonable for this account. Based on the same considerations, Concentric views that a net salvage percentage of negative 10 percent is reasonable.

3.2.1.2 Piping

Includes all gas capture, manifold, processing and re-injection piping. The piping used within RNG facilities is similar to piping used with other natural gas distribution system manifold installations and in underground storage and LNG storage sites. As such, there exist a reasonable amount of peer

installations. Specifically, Concentric placed additional weight on the RNG installations by regulated utilities which were in line with other natural gas station piping installations.

Review of peer RNG facilities in Canada indicate average service life estimates ranging from 40 to 65 years. The Enbridge underground storage station piping has an approved average service life estimate of 55 years. Natural gas distribution systems throughout Canada have average service life estimates ranging from 45 through 70 years. As such, the peer analysis indicated that the appropriate average service life could fit within the broad range of 25 to 70 years. After removing the two extremes of the peer analysis, a tighter band of 40 to 60 years was indicated.

Concentric notes that the source gas, although scrubbed and purified may prove to be more caustic than natural gas. Additionally, RNG technology is new and has not been in service within regulated utilities for any significant period of time. As such, Concentric recommends the use of a 40-year average service life estimate at this point in time. Based on the same considerations, Concentric views that a net salvage percentage of negative 10 percent is reasonable.

3.2.1.3 Compression

Includes the compression equipment required for the initial, intermediate and final compression. Specifically, this account should include the compressor, the driver, and all associated equipment, excluding the building and structure, related to compression assets and the control system.

The compression used within RNG facilities is similar to equipment used with other natural gas distribution system station installations, and in underground storage and LNG storage sites. As such, there exists a reasonable amount of peer installations. Specifically, Concentric placed additional weight on the RNG installations by regulated utilities which were in line with other natural gas station piping installations.

Review of peer RNG facilities in Canada indicate average service life estimates ranging from 25 to 40 years. The Enbridge underground storage compression equipment has an approved average service life estimate of 40 years. Natural gas distribution systems throughout Canada have average service life estimates ranging from 25 through 35 years. As such, the peer analysis indicated that the appropriate average service life could fit within the range of 25 to 40 years. Concentric recommends the use of a 25-year average service life at this point in time. Based on the same considerations, Concentric views that a net salvage percentage of negative 5 percent is reasonable.

3.2.1.4 Metering Equipment

Includes the meters and associated equipment related to the metering of the source gas and the final gas back into the distribution system. The metering equipment used within the Enbridge RNG installation will be subject to the same Measurement Canada metering standards as all other metering equipment within Canada, including the metering equipment used for the measurement of natural gas within the regulated natural gas industry. Given the Measurement Canada S-S-06 standard, which became effective in 2014, meters now have a life of between 10 and 20 years. Concentric notes that the meters within the Enbridge natural gas distribution system have an approved average service life estimate of 15 years. However, the meters installed at the RNG facility

are larger and likely to experience a slightly longer life. As such, Concentric views that a 20-year average service life is appropriate for this account.

Given that there will be a small amount of cost of removal required for the retirement of meters, Concentric views that a negative 5 percent is appropriate for metering equipment. This recommended percentage falls within the range of 0 percent through negative 25 percent used by peer RNG Canadian facilities.

3.2.1.5 Scrubbing Equipment and Vessels

This grouping includes the equipment and vessels associated with the desulfurization, dehydration, and NMOC/Siloxane removal processes. Concentric based the average service life estimate peer analysis of regulated peer RNG facilities ranging from 20 to 25 years. At this time, Concentric views that a 25-year average service is appropriate.

Given that there will be a small amount of cost of removal required for the retirement of this equipment, Concentric views that a negative 5 percent is appropriate for this account. This recommended percentage falls within the range of 0 percent through negative 10 percent used by peer RNG Canadian facilities.

3.2.1.6 Purification Equipment and Vessels

This grouping includes the equipment and vessels associated with the CO₂, and the N₂O₂ removal processes, undertaken in the purification process. Specifically, this account should include the final purification of the gas in order that it meets the required specifications to be injected into the gas distribution system. Concentric based the average service life estimate peer analysis of regulated peer RNG facilities ranging from 20 to 25 years. At this time, Concentric views that a 25-year average service is appropriate.

Given that there will be a small amount of cost of removal required for the retirement of this equipment, Concentric views that a negative 5 percent is appropriate for this account. This recommended percentages falls within the range of 0 percent through negative 20 percent used by peer RNG Canadian facilities.

3.2.1.7 Control Equipment

Includes instrumentation and control equipment associated with all of the processes within the facility. This equipment is highly specialized and digital in nature. Over the past decade, this type of equipment has been subjected to a very high level of technological change with the average service life estimates ranging from 10 years to 25 years. In most of the depreciation studies over the past 5 years, the Concentric recommend lives of between 15 and 20 years have been approved by regulatory authorities across Canada. Concentric therefore views that a 15-year average service life is appropriate for this account.

3.2.2 Power to Gas

The average service life and net salvage parameters were selected based on a review of the industry material conducted by Concentric's "Depreciation" and "Utility of the Future" practice areas. Additional information was gained through consultation with Enbridge to understand the specific

Company installation. The following is an account by account discussion of the specific recommendations.

3.2.2.1 Building and Structures

Includes compression and control equipment structures and improvements. This account should also include all site preparation (grading, gravel, etc.), fencing and security. This account also includes all HVDC and building requirements and equipment specific to the rectifier room, including overhead entry and rectifier service doors. The Concentric recommendation of a 40-year average service life and a negative 10 percent cost of removal was based on the same review conducted for the Building and Structures account related to the RNG assets.

3.2.2.2 Rectifier and Equipment

This includes the costs associated with the rectifier bank and all directly related equipment used in the power to hydrogen conversion process. The rectifier equipment includes all racking associated with the conversion valves including racking and railing systems. Concentric understands this equipment is similar to the rectifying equipment used within the AC/DC converter substations, used in HVDC electric transmission substations. Within Canada, the Manitoba Hydro HVDC system has received the most reviews of its HVDC average service lives. The rectifiers within the Manitoba Hydro HVDC system have an approved 25-year average service life. As such, Concentric recommends a 25-year average service life estimate for this account. Concentric also views that a minimal net salvage of negative 5 percent is also appropriate.

3.2.2.3 Proton Exchange Membrane Electrolyser (“PEM Electrolyser”)

The heart of the PtG solution is the PEM Electrolyser. The PEM converts surplus energy to hydrogen by electrolysis - the splitting of water (H₂O) molecules into its constituent elements of hydrogen (H) and oxygen (O) using electricity. The hydrogen and oxygen are evolved as gases from the electrolyser. The hydrogen is then compressed, metered used for grid regulations services and can be injected into the existing natural gas distribution system

While this equipment is extremely technical and of very recent technology, it comprises the major component within the PtG installation and therefore will be subjected to a large amount of vendor support. There are virtually no comparables within the Canadian regulated environment, therefore a peer analysis was not meaningful. The industry research into this technology conducted by Concentric has indicated that the life characteristic of the PEM will be similar to the performance of battery cells, in that there will be a degree of degradation that occurs through use over time. With this background, and due to the limited historical experience available for this technology, Concentric views that a 20-year life is appropriate for this asset. This recommendation balances the accounting goal of depreciating an asset over its expected life with the reality that there is a limited amount of actual installed historic information.

Given that there will be a small amount of cost of removal required for the retirement of this equipment, Concentric views that a negative 5 percent is appropriate for this account.

3.2.2.4 Other Electrical Equipment

Includes all other electrical equipment except for the protection and control systems and equipment. Specifically, this account will include all transformers, MCC and switchgear, power inverter, UPS devices and panels and equipment required for the PtG and gas to power conversions.

Concentric understands this equipment is similar to the specialized electrical equipment used within the AC/DC converter substations used in HVDC electric transmission substations. Within Canada, the Manitoba Hydro HVDC system has received the most review of its HVDC average service lives. The Manitoba Hydro HVDC system have an approved 25-year average service life. As such, Concentric recommends a 25-year average service life estimate for this account. Concentric also views that a minimal net salvage of negative 5 percent is also appropriate.

3.2.2.5 Fuel Cells

All costs associated with the installation of the hydrogen fuel cells should be grouped in this account, including the fuel cell racks. The industry research conducted by Concentric into this technology has indicated that the life characteristic of the fuel cells will be similar to the performance of battery cells, in that there will be a degree of degradation that occurs through use over time. With this background, and due to the limited historical experience available for this technology, Concentric views that a 15-year life is appropriate for this asset.

It is anticipated that upon retirement of these fuel cell, a small amount of cost of removal will be required, Given the nature of these assets, specific environmental practices may be required for the safe disposal of the cells. Concentric recommends a provision of negative 10 percent be applied at time.

3.2.2.6 Hydrogen Gas Module and Enclosure

Includes the investment in the two gas stack and enclosure modules and all related costs including the hydrogen storage tanks. The Concentric recommendation of a 20-year average service life and a negative 5 percentage salvage is based on our experience within the natural gas industry related to compressed natural gas product module, enclosure facilities, and storage vessels.

3.2.2.7 Water System and Storage tank

This account should include all investment in the water system used in the power to gas processes including all water piping, storage (including tanks), pumps, filtration and purification equipment. Water purification and storage is widely used in a number of regulated utility processes and Concentric has developed average service life estimates in a number of studies. As this account includes a variety of related assets, an average age of 25-years is reasonable for this account. While some assets within this account, such as the filtration and purification equipment, may have a life of shorter than 25 years, other assets such as the storage tanks and piping will have an off-setting longer life. Based on Concentric's experience a negative 5 percent salvage provision is recommended.

3.2.2.8 Control Equipment

Includes all instrumentation and control equipment associated to all of the processes within the facility. The Concentric recommendation of a 15-year average service life was based on the same review conducted for the Control Equipment account related to the RNG assets.

3.2.3 Geothermal

The average service life and net salvage parameters were selected by Concentric based on a review of peer systems within Canada, and in consultation with Enbridge to understand the specific company installation. In some accounts, similar asset installations are widely used within natural gas installations. The following is an account by account discussion of the specific recommendations.

3.2.3.1 Heat Loops

This account should include the investment associated with the drilling, casing and tubing within the heat loops. It is expected that this account will have a long life and there is little capital maintenance on these loops. Concentric notes that within the geothermal industry, life estimates of between 50 to 70 years are common. Given that the installation of geothermal is new to Enbridge, a life estimate on the lower end of the range of peer installations is appropriate. As such, a 50-year average life is recommended for this account. Once the system matures, future reviews may indicate that an extension may (at that time) be appropriate.

3.2.3.2 Pumps

Includes the investment associated with the recirculating pumps used in the heat transfer process. Recirculating pumps are widely used in regulated utility installations, but the pumps are not usually specifically broken out. However, in the circumstances of these proposed geothermal installations, the pumps form a critical component of the systems operations and it is therefore recommended that they are separately componentized in this circumstance. The recommended 20-year life for these pumps is consistent with Concentric's understanding of the life characteristics of these pumps.

3.2.3.3 Other

Includes all other investment associated with the geothermal systems. This account will include any investment in ancillary equipment not covered by the prior two accounts. An account life of 20- years is based on the expectation of a widely divergent group of small assets being combined into this one account.

3.3 Depreciation Methods & Procedures

This study calculates the annual and accrued depreciation using the straight-line method and ALG procedure for most accounts, applied on a remaining life basis. This method is the same method approved for the remainder to the Enbridge's assets. It should be noted that as these assets are all new, the remaining life is equal to the whole life of the assets in this study. Future depreciation rate calculations will need to consider the attained age of the investment as of the next study date. Continued monitoring and maintenance of the accumulated depreciation reserve at the account level is recommended.

SECTION 4

4 RESULTS OF THE STUDY

4.1 Qualification of Results

The calculated annual and accrued depreciation are the principal results of the update. Continued surveillance and periodic revisions are normally required to maintain continued use of appropriate annual depreciation accrual rates. An assumption that accrual rates can remain unchanged over a long period of time implies a disregard for the inherent variability in service lives and salvage, and for the change of the composition of property in service. The annual accrual rates and the accrued depreciation were calculated in accordance with the straight-line method, using the ALG procedure based on estimates which reflect considerations of current historical evidence and expected future conditions.

EXECUTIVE SUMMARY

INTRODUCTION

This report presents a review and update of depreciation rates and parameters for utility plant owned and operated by Union Gas Limited (Union). The report contains recommended 2017 depreciation rates and parameters for: a) intangible assets; b) local and underground storage facilities; and c) gas transmission, distribution and general plant categories. Work on the study commenced in February 2017 and progressed through early June, at which time the project was completed.

Foster Associates is a public utility economic consulting firm offering economic research and consulting services on issues and problems arising from governmental regulation of business. Areas of specialization supported by the firm's Fort Myers office include property life forecasting, technological forecasting, depreciation estimation, and valuation of industrial property.

Foster Associates has undertaken numerous depreciation engagements for both public and privately owned business entities including detailed statistical life studies, analyses of required net salvage rates, and the selection of depreciation systems that will most nearly achieve the goals of depreciation accounting under the constraints of either government regulation or competitive market pricing. Foster Associates is widely recognized for industry leadership in the development of depreciation systems, life analysis techniques and computer software for conducting depreciation and valuation studies.

This is the ninth comprehensive depreciation study undertaken by Union in the last 45 years. Rates currently used by Union were developed by Foster Associates in a 2011 comprehensive study in which revised parameters were estimated for all plant accounts. Rates proposed in the 2011 study were adopted January 1, 2013 pursuant to a Settlement Agreement approved by the Ontario Energy Board (OEB) under Docket No. EB-2011-0210. The settlement agreement accepted all depreciation rates developed in the 2011 study.

On January 1, 1998, Union Gas formalized a legal merger with Centra Gas Ontario. The depreciation rates adopted by Union in RP-2003-0063 retained the pre-merger corporate identity for plant classified in the Distribution function. This treatment was adopted to preserve a jurisdictional separation of distribution plant for ratemaking purposes. While it is the intention of Union to eventually eliminate the pre-merger corporate identity of former Centra assets, the current study retains the distinction between Northern and Eastern Operations (previously Centra) and the Southern Operations of Union for plant classified in the Distribution function.

The current study also preserves the elimination of Accounts 49601 and 49602 (Contributions in Aid of Construction) proposed in the 2003 study and approved in RP-2003-0063. Depreciation rates developed prior to the 2003 study included

rates for the CIAC accounts derived from a composite weighted average of the accrual rates for the major plant accounts in which investments were funded by contributions. The current treatment of CIAC is to credit the associated plant accounts as previously permitted by the OEB Uniform System of Accounts for Gas Utilities.¹ Depreciation reserves for the CIAC accounts were distributed and combined with the associated plant reserves in the 2003 study.

The principal findings and recommendations of the 2017 study are summarized in the Statements section of this report. Statement A provides a comparative summary of current and proposed annual depreciation rates for each rate category. Statement B provides a comparison of current and proposed annual depreciation accruals. Statement C provides a comparison of recorded, computed and redistributed depreciation reserves for each rate category. Statement D provides a summary of the investment and net salvage components of rebalanced reserves. Statement E provides a summary of the components used to obtain a weighted-average net salvage rate for each plant account. Statement F provides the computation of future net salvage rates for the Local Storage function. Statement G provides a comparative summary of current and proposed parameters including projection life, projection curve, average service life, average remaining life, and average and future net salvage rates.

SCOPE OF STUDY

The principal activities undertaken in the course of the current study included:

- Collection of plant and net salvage data;
- Reconciliation of data to the official records of the Company;
- Communication with Union plant accounting and operations personnel;
- Estimation of projection lives and retirement dispersion patterns;
- Analysis of gross salvage and cost of removal;
- Analysis and redistribution of recorded depreciation reserves; and
- Development of recommended accrual rates for each rate category.

¹ Contributions or grants in cash, services or property from governments or government agencies, corporations, individuals, and others for contributions in aid of construction shall be applied as a reduction of the detail plant accounts to which they refer, if not recorded separately in Account No. 499, "Contributions and Grants". (USOA, Appendix A, Section 1, Part B)

DEPRECIATION SYSTEM

A depreciation rate is formed by combining the elements of a depreciation system. A depreciation system is composed of a method, a procedure and a technique. A depreciation method (*e.g.*, straight-line) describes the component of the system that determines the acceleration or deceleration of depreciation accruals in relation to either time or use. A depreciation procedure (*e.g.*, vintage group) identifies the level of grouping or sub-grouping of assets within a plant category. The level of grouping specifies the weighting used to obtain composite life statistics for a plant category. A depreciation technique (*e.g.*, remaining-life) describes the life statistic used in the system.

With the exception of selected general support asset categories and Account 47400 (Regulators) for which amortization accounting has been approved, Union is currently using a depreciation system composed of the straight-line method, vintage group procedure and remaining-life technique.² Amortization accounting is used for general plant categories in which the unit cost of plant items is small in relation to the number of units classified in the account. Plant is retired (*i.e.*, credited to plant and charged to the reserve) as each vintage achieves an age equal to the amortization period. Any realized net salvage for amortizable accounts is netted against current-year vintage additions.

The matching and expense recognition principles of accounting provide that the cost of an asset (or group of assets) should be allocated to operations over an estimate of the economic life of the asset in proportion to the consumption of service potential. It is the opinion of Foster Associates that the objectives of depreciation accounting are being achieved using the currently approved vintage group procedure, which distinguishes average service lives among vintages, and the remaining-life technique which provides cost apportionment over the estimated weighted average remaining life of a rate category. It is also the opinion of Foster Associates that amortization accounting remains appropriate for the approved amortization categories. Accordingly, the depreciation system currently approved for Union was used in the current study to develop accrual rates proposed for calendar year 2017.

PROPOSED DEPRECIATION RATES

Table 1 below provides a summary of the changes in annual rates and accruals resulting from an application of the service life and net salvage parameters recommended in the current study.

² House regulators for new installations are now typically pre-assembled as a component of a meter manifold and classified as minor items of property in Account 47401 (Regulator and Meter Installations).

Function	Accrual Rate			2017 Annualized Accrual		
	Current	Proposed	Diff.	Current	Proposed	Difference
A	B	C	D=C-B	E	F	G=F-E
Intangible	5.45%	12.89%	7.44%	\$ 58,319	\$ 137,932	\$ 79,613
Local Storage	3.26%	1.58%	-1.68%	853,763	414,351	(439,412)
U/G Storage	2.64%	2.41%	-0.23%	13,570,724	12,419,913	(1,150,811)
Transmission	2.35%	2.08%	-0.27%	62,669,247	55,345,134	(7,324,113)
Distribution	2.83%	2.83%		119,481,639	119,924,844	443,205
General Plant	10.56%	10.30%	-0.26%	27,373,587	26,707,626	(665,961)
Total	2.91%	2.79%	-0.12%	\$ 224,007,279	\$ 214,949,800	\$ (9,057,479)

Table 1. Union Gas Depreciation Rates and Accruals

Foster Associates is recommending primary account depreciation rates equivalent to a composite rate of 2.79 percent. Depreciation expense is currently accrued at an equivalent composite rate of 2.91 percent. The recommended change in the composite depreciation rate is, therefore, a reduction of 0.12 percentage points.

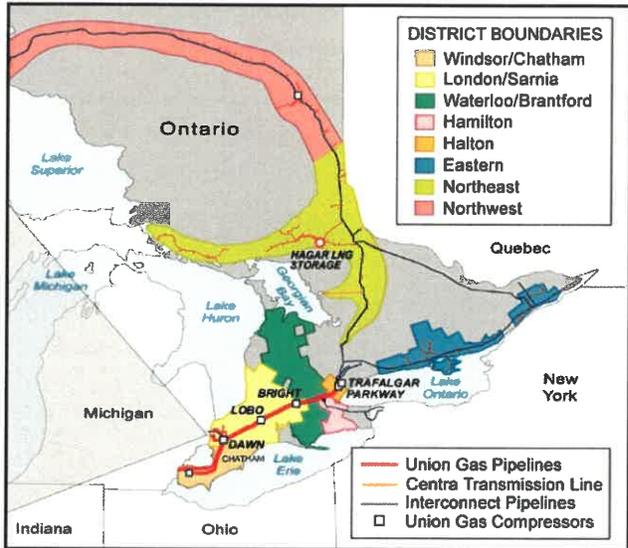

A continued application of current rates would provide annualized depreciation expense of \$224,007,279 compared with an annualized expense of \$214,949,800 using the rates developed in this study. The proposed expense reduction is \$9,057,479. The change in annualized accruals includes a reduction of \$4,386,668 attributable to an amortization of a \$177,007,031 reserve imbalance. A proportionate amount of the estimated reserve imbalance will be amortized over the weighted average remaining life of each rate category. The remaining portion of the change in accruals is attributable to recommended adjustments to various service life and net salvage parameters.

Of the 42 property accounts included in the 2017 study, Foster Associates is recommending rate reductions for 24 accounts, rate increases for 11 accounts and no change for 7 accounts.

COMPANY PROFILE

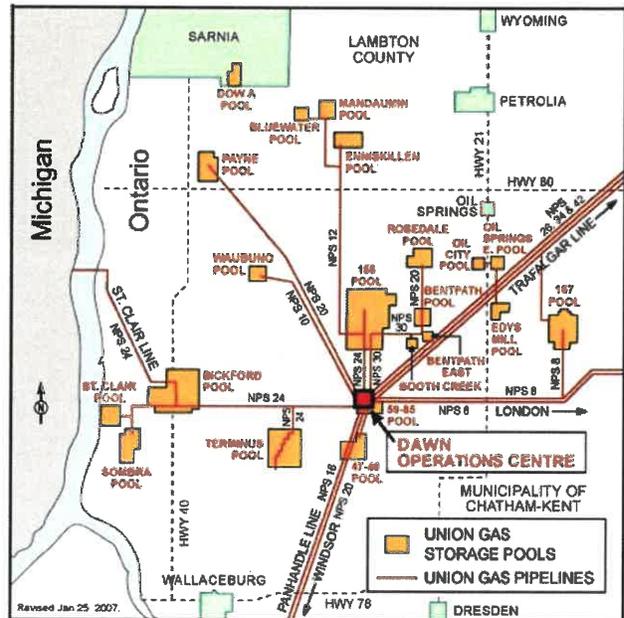

GENERAL

Union Gas Limited, an Enbridge Company, is a major Canadian natural gas utility that provides energy delivery and related services to 1.4 million residential, commercial and industrial customers in over 400 communities in northern, southwestern and eastern Ontario. Its distribution service area extends throughout northern Ontario from the Manitoba border to the North Bay/Muskoka area, through southwestern Ontario from Windsor to just west of Toronto, and across eastern Ontario from Port Hope to Cornwall.

The Company also provides natural gas storage and transportation services for other utilities and energy market participants in Ontario, Quebec and the United States. Union Gas has assets of approximately \$8.2 billion including 40,630 miles of distribution mains and service pipelines and 3,015 miles of transmission pipelines. The Company employs about 2,300 people.

The Dawn Hub is the largest natural gas storage facility in Canada and one of the largest in North America. Ten major pipelines currently connect to the Dawn Hub. Dawn storage is made up of 23 individual reservoirs with a working capacity of 162 Bcf. All reservoirs are connected by a gathering system and then connected to the utility pipeline system. Nine large compressors move natural gas to and from the reservoirs. Storage injection season typically begins April 1st and ends October 31st.

STUDY PROCEDURE

INTRODUCTION

The purpose of a depreciation study is to analyze the mortality characteristics, net salvage rates and adequacy of the depreciation accrual and recorded depreciation reserve for each rate category. This study provides the foundation and documentation for recommended changes in the depreciation accrual rates used by Union. The proposed rates are subject to approval by the Ontario Energy Board.

SCOPE

The steps involved in conducting a depreciation study can be grouped into five major tasks:

- Data Collection;
- Life Analysis and Estimation;
- Net Salvage Analysis;
- Depreciation Reserve Analysis; and
- Development of Accrual Rates.

The scope of the 2017 study included a consideration of each of these tasks as described below.

DATA COLLECTION

The minimum database required to conduct a statistical life study consists of a history of vintage year additions and unaged activity year retirements, transfers and adjustments. These data must be appropriately adjusted for transfers, sales and other plant activity that would otherwise bias the measured service life of normal retirements. The age distribution of surviving plant for unaged data can be estimated by distributing plant in service at the beginning of a study year to prior vintages in proportion to the theoretical amount surviving from a projection or survivor curve identified in the life study. Statistical methods of life analysis used to examine unaged plant data are known as *semi-actuarial techniques*.

A far more extensive database is required to apply statistical methods of life analysis known as *actuarial techniques*. Plant data used in an actuarial life study most often include age distributions of surviving plant at the beginning of a study year and the vintage year, activity year, and dollar amounts associated with normal retirements, reimbursed retirements, sales, abnormal retirements, transfers, corrections, and extraordinary adjustments over a series of prior activity years. An actuarial database may include age distributions of surviving plant at the beginning of the earliest activity year, rather than at the beginning of the study year. Plant additions, however, must be included in a database containing an opening age distribution to derive aged survivors at the beginning of a study year. All activity year transactions with vintage year identification are coded in a database. These data are processed by a computer program and transaction summary reports are created in a format reconcilable to official plant records. The availability of

such detailed information is dependent upon an accounting system that supports aged property records.

Prior to 1994, Union did not have a plant accounting system within which aged plant records could be maintained. In October, 1994 the Company implemented an in-house, designed and developed Continuing Property Record (CPR) system with vintage year identification of plant in service at March 31, 1994. Property tax records were used to construct the age distribution of pre-1982 vintages and the aging of post-1982 vintages was obtained from a detailed analysis of subsidiary plant records. The Company adopted calendar year accounting for financial reporting purposes commencing with calendar year 1995, which was reported as a nine-month accounting period.

On April 1, 1997 the in-house system was converted to a commercial product developed by SAP. The new system was populated with vintage year identification of plant in service at December 31, 1996. Plant accounting records for the Northern and Eastern Operations (formerly Centra) were also uploaded to the new Union system on April 1, 1997.

With the exception of Accounts 45200 (Structures and Improvements), 46200 (Structures and Improvements), 47200 (Structures and Improvements) and 48200 (Structures and Improvements), Union can now provide plant accounting transactions with vintage year identification for post-1997 activity for all remaining plant categories. The vintage year assigned to plant activity associated with structures and improvements is the year the plant was originally constructed. While this practice will not misstate the aggregate investment in a plant category, the reported age distribution of surviving plant is not representative of the actual age of the investments. An aged data base was assembled by Foster Associates for all plant categories over the period 1997 through 2002 in conducting the 2003 study.

Service life statistics estimated in the current study were derived from plant accounting transactions recorded over the period 1997 through 2016. Detailed accounting transactions were extracted from the CPR system and assigned transaction codes which describe the nature of the accounting activity. Transaction codes for plant additions, for example, were used to distinguish normal additions from acquisitions, purchases, reimbursements and adjustments. Similar transaction codes were used to distinguish normal retirements from sales, reimbursements, abnormal retirements and adjustments. Transaction codes were also assigned to transfers, capital leases, gross salvage, cost of removal and other recorded accounting activity.

The database used in conducting the 2011 study was updated for the current study by appending plant and net salvage transactions for activity years 2011-2016 and age distributions of surviving plant at December 31, 2016. The accuracy and completeness of the assembled database was verified for activity years 2011

through 2016 by comparing the beginning plant balance, additions, retirements, transfers and adjustments, and the ending plant balance derived for each activity year to the official plant records of the Company. Activity years prior to 2011 were verified in the 2011 study. Age distributions of surviving plant at December 31, 2016 were reconciled to the CPR system.

Reserve transactions recorded over the period 1997–2016 were used in the 2017 study to estimate appropriate net salvage rates. Realized net salvage was blended with future net salvage estimates to derive average net salvage rates used in the computation of theoretical reserves.

LIFE ANALYSIS AND ESTIMATION

Life analysis and life estimation are terms used to describe a two-step procedure for estimating the mortality characteristics of a plant category. The first step (*i.e.*, life analysis) is largely mechanical and primarily concerned with history. Statistical techniques are used in this step to obtain a mathematical description of the forces of retirement acting upon a plant category and an estimate of the *projection life* of the account. Mathematical expressions used to describe these life characteristics are known as *survival functions* or *survivor curves*.

The second step (*i.e.*, life estimation) is concerned with predicting the expected remaining life of property units still exposed to forces of retirement. It is a process of blending the results of a life analysis with informed judgment (including expectations about the future) to obtain an appropriate projection life and probability distribution descriptive of the parent population from which a plant account is viewed as a random sample. The amount of weight given to a life analysis will depend upon the extent to which past retirement experience is considered descriptive of the future.

Analytical methods used in a life analysis are broadly classified as actuarial and semi-actuarial techniques. Actuarial techniques can be applied to plant accounting records that reveal the age of a plant asset at the time of its retirement from service. Stated differently, each property unit must be identifiable by date of installation and age at retirement. Semi-actuarial techniques can be used to derive service life and dispersion estimates when age identification of retirements is not maintained or readily available. Age identification of retirements was available for all plant accounts included in the 2017 depreciation study.

An actuarial life analysis program designed and developed by Foster Associates was used in this study to analyze post-1997 plant accounting activity. The first step in an actuarial analysis involves a systematic treatment of the available data for the purpose of constructing an observed life table. A complete life table contains the life history of a group of property units installed during the same accounting period and various probability relationships derived from the data. A life table is arranged by age-intervals (usually defined as one year) and shows the

number of units (or dollars) entering and leaving each age-interval and probability relationships associated with this activity. A life table minimally contains the age of each survivor and the age of each retirement from a group of property units installed in a given accounting year.

A life table can be constructed in any one of at least five methods. The annual-rate or retirement-rate method was used in this study. The mechanics of the annual-rate method require the calculation of a series of ratios obtained by dividing the number of units (or dollars) surviving at the beginning of an age interval into the number of units (or dollars) retired during the same interval. This ratio—called a “retirement ratio”—is an estimator of the hazard rate or conditional probability of retirement during an age interval. The cumulative proportion surviving is obtained by multiplying the retirement ratio for each age interval by the proportion of the original group surviving at the beginning of that age interval and subtracting this product from the proportion surviving at the beginning of the same interval. The annual-rate method is applied to multiple groups or vintages by combining the retirements and/or survivors of like ages for each vintage included in the analysis.

The second step in an actuarial analysis involves graduating or smoothing the observed life table and fitting the smoothed series to a family of survival functions. The functions used in the 2017 study are the Iowa-type curves mathematically described by the Pearson frequency curve family. Observed life tables were smoothed by a weighted least-squares procedure in which first, second and third degree orthogonal polynomials were fitted to the observed retirement ratios. The resulting functions were expressed as survivorship functions and numerically integrated to obtain an estimate of the projection life of a plant category. The observed proportions surviving were then fitted by a weighted least-squares procedure to the Iowa-curve family (using projection lives derived from the graduation of hazard rates) to obtain a mathematical description or classification of the dispersion characteristics of the data. Service life indications derived from the statistical analyses were blended with informed judgment and expectations about the future to obtain an appropriate projection life and curve for each plant category.

The set of computer programs used by Foster Associates provides rolling-band, shrinking-band and progressive-band analyses of an account. Observation bands are defined for a "retirement era" that restricts the analysis to the retirement activity of all vintages represented by survivors at the beginning of a selected era. In a rolling-band analysis, a year of retirement experience is added to each successive retirement band and the earliest year from the preceding band is dropped. A shrinking-band analysis begins with the total retirement experience available and the earliest year from the preceding band is dropped for each successive band. A progressive-band analysis adds a year of retirement activity to a previous band without dropping earlier years from the analysis. Rolling, shrinking and progres-

sive band analyses are used to detect the emergence of trends in the behavior of the dispersion and projection life.

Options available in the actuarial life analysis program include the width and location of both placement and observation bands; the interval of years included in a selected band analysis; the estimator of the hazard rate (actuarial, conditional proportion retired, or maximum likelihood); the elements to include on the diagonal of a weight matrix (exposures, inverse of age, inverse of variance, or un-weighted); and the age at which an observed life table is truncated. The program also provides tabular and graphics output and algorithms for calculating depreciation rates and accruals.

While actuarial and semi-actuarial statistical methods are well suited to an analysis of plant categories containing a large number of homogeneous units (*e.g.*, mains and services), these methods are not well-suited to plant categories composed of major items of plant that will most likely be retired as a single unit. Plant retirements from an integrated system prior to the retirement of the entire facility are more properly viewed as interim retirements that will be replaced in order to maintain the integrity of the system. Additionally, plant facilities may be added to the existing system (*i.e.*, interim additions) to expand or enhance its productive capacity without extending the service life of the present system. A proper depreciation rate can be developed for an integrated system using a life-span method.

The life-span method requires the selection of a coterminous retirement date for all plant additions to a specific facility. A composite depreciation rate is calculated for the facility using the technique of harmonic weighting of the expected life span of each vintage addition. The resulting accrual rate should be adjusted for interim retirements to the extent that such retirements can be reasonably expected. Absent this adjustment, the depreciation accumulated over the life span of the facility will be deficient by an amount equal to a portion of the interim retirements. Properly implemented, the life-span method does not include plant additions or replacements of interim retirements until the occurrence of such activity. All accounts in the Local Storage function, Account 45200 (Structures and Improvements) in the Underground Storage function and Account 48200 (Structures and Improvements) in the General plant function were treated as life-span categories in this study.

NET SALVAGE ANALYSIS

Depreciation rates designed to achieve the goals and objectives of depreciation accounting will include a parameter for future net salvage and a variable for average net salvage reflecting both realized and future net salvage rates.

Estimates of net salvage rates applicable to future retirements are most often derived from an analysis of gross salvage and cost of removal realized in the past. An analysis of past experience (including an examination of trends over time)

provides a basis for estimating future salvage and cost of removal. However, consideration should also be given to events that may cause deviations from net salvage realized in the past. Among the factors that should be considered are: the age of plant retirements; the portion of retirements likely to be reused; changes in the method of removing plant; the type of plant to be retired in the future; inflation expectations; the shape of the projection life curve; and economic conditions that may warrant greater or lesser weight to be given to net salvage rates observed in the past.

Special consideration should also be given to the treatment of insurance proceeds and other forms of third-party reimbursements credited to the depreciation reserve. A properly conducted net salvage study will exclude such activity from the estimate of future parameters and include the activity in the computation of realized and average net salvage rates.

A five-year moving average analysis of the ratio of realized salvage and cost of removal to the associated retirements was used in the 2017 study to a) estimate a realized net salvage rate; b) detect the emergence of historical trends; and c) establish a basis for estimating future net salvage rates. Cost of removal and salvage opinions obtained from Company personnel were blended with judgment and historical net salvage indications in developing estimates of the future.

Average net salvage rates for all depreciable accounts were estimated using direct dollar weighting of a) historical retirements with historical (or realized) net salvage rates and b) future retirements (*i.e.*, surviving plant) with the estimated future net salvage rates. Average net salvage rates will change, therefore, as additional years of retirement and net salvage activity become available and as the weighting of future net salvage estimates changes from the installation of subsequent plant additions. The computation of estimated average net salvage rates shown in Statement E.

A 1994 dismantlement study conducted by Stone & Webster Canada Limited for the Hagar LNG plant (previously owned by Centra) was used in the 2003 depreciation study to derive a reasoned estimate of a net salvage rate for the Local Storage function. Noting that the estimated year of final retirement has been extended from 2017 to 2050 and a dismantlement study more recent than 1994 has not been conducted, terminal net salvage was removed from the estimate of future net salvage rates in the current study. It remains the opinion of Foster Associates, however, that terminal net salvage should be included in the formulation of depreciation rates when an updated dismantlement study becomes available. The computations supporting the recommended weighted-average interim and final net salvage rates for the Local Storage function are shown in Statement F.

DEPRECIATION RESERVE ANALYSIS

The purpose of a depreciation reserve analysis is to compare the current level of recorded reserves with the level required to achieve the goals or objectives of depreciation accounting if the amount and timing of future retirements and net salvage are realized as predicted. The difference between a required (or theoretical) depreciation reserve and a recorded reserve provides a measurement of the expected excess or shortfall that will remain in the depreciation reserve if corrective action is not taken to eliminate the reserve imbalance.

Unlike a recorded reserve which represents the net amount of depreciation expense charged to previous periods of operations, a theoretical reserve is a measurement of the implied reserve requirement at the beginning of a study year if the timing of future retirements and net salvage is in exact conformance with a survivor curve chosen to predict the probable life of plant units still exposed to the forces of retirement. Stated differently, a theoretical depreciation reserve is the difference between the recorded cost of plant presently in service and the sum of the depreciation expense and net salvage that will be charged in the future if retirements are distributed over time according to a specified retirement frequency distribution.

The survivor or projection curve used in the calculation of a theoretical depreciation reserve is intended to describe forces of retirement that will be operative in the future. However, retirements caused by forces such as accidents, physical deterioration and changing technology seldom, if ever, remain stable over time. It is unlikely, therefore, that a probability or retirement frequency distribution can be identified that will accurately describe the age of plant retirements over the complete life cycle of multiple vintages. It is for this reason that depreciation rates should be reviewed periodically and adjusted for observed or expected changes in the parameters chosen to describe the underlying forces of mortality.

Although reserve records are commonly maintained by various account classifications, the total recorded reserve in relation to the sum of account computed reserves is an indicator of the adequacy (or inadequacy) of recorded reserves. If statistical life studies have not been conducted or retirement dispersion has not been considered in setting depreciation rates, it is likely that some accounts will be over-depreciated and other accounts will be under-depreciated relative to a calculated or theoretical reserve. Differences between a theoretical reserve and a recorded reserve also will arise as a normal occurrence when service lives, dispersion patterns and net salvage estimates are adjusted in the course of depreciation reviews. It is appropriate, therefore, and consistent with group depreciation theory to periodically redistribute or rebalance recorded reserves among the various primary accounts based upon the most recent estimates of retirement dispersion and net salvage rates.

It is the opinion of Foster Associates that a redistribution of recorded reserves is again appropriate for Union. Offsetting reserve imbalances (attributable to both the passage of time and parameter adjustments recommended in the current study) should be realigned among primary accounts to reduce offsetting imbalances and increase depreciation rate stability.

A redistribution of the recorded reserve for depreciable plant was achieved by multiplying the calculated reserve for each primary account within a function by the ratio of the function total recorded reserves (net of amortizable accounts) to the function total calculated reserve.³ The sum of the redistributed reserves within a function (or combined functions) is, therefore, equal to the function (or operating division) total recorded depreciation reserve before the redistribution. Reserves for general amortizable categories were adjusted by replacing recorded reserves with current measured theoretical reserves and distributing any reserve imbalances to depreciable accounts within the appropriate function(s).

Statement C provides a comparison of the computed, recorded and redistributed reserves for Union at December 31, 2016. The total recorded reserve was \$3,184,342,725 or 41.4 percent of the total utility plant investment. The corresponding computed reserve is \$3,007,335,694 or 39.6 percent of the total utility plant investment. A proportionate amount of the measured reserve imbalance of \$177,007,031 will be amortized over the composite weighted-average remaining life of each rate category.

DEVELOPMENT OF ACCRUAL RATES

The goal or objective of depreciation accounting is cost allocation over the economic life of an asset in proportion to the consumption of service potential. Ideally, the cost of an asset—which represents the cost of obtaining a bundle of service units—should be allocated to future periods of operation in proportion to the amount of service potential expended during an accounting interval. The service potential of an asset is the present value of future net revenue (*i.e.*, revenue less expenses exclusive of depreciation and other non-cash expenses) or cash inflows attributable to the use of that asset alone.

Cost allocation in proportion to the consumption of service potential is most often approximated by the use of depreciation methods employing time rather than net revenue as the apportionment base. Examples of time-based methods include sinking-fund, straight-line, declining balance, and sum-of-the-years' digits. The advantage of using a time-based method is that it does not require an estimate of the remaining amount of service potential an asset will provide or the

³ The distinction between North and South operations was retained in rebalancing depreciation reserves. Accordingly, recorded reserves were redistributed within each operating division.

amount of potential actually consumed during an accounting interval. Using a time-based allocation method, however, does not change the goal of depreciation accounting. If it is predictable that the net revenue pattern of an asset will either decrease or increase over time, then an accelerated or decelerated time-based method should be used to approximate the rate at which service potential is actually consumed.

The time period over which the cost of an asset will be allocated to operations is determined by the combination of a procedure and a technique. A depreciation procedure describes the level of grouping or sub-grouping of assets within a plant category. The broad group, vintage group, equal-life group, and item (or unit) are a few of the more widely used procedures. A depreciation technique describes the life statistic used in a depreciation system. Whole life and remaining life (or expectancy) are the most common techniques.

Depreciation rates recommended in the 2017 study were developed using the currently approved system composed of the straight-line method, vintage group procedure and remaining-life technique. This formulation of the accrual rate is equivalent to a straight-line method, vintage group procedure and whole-life technique with amortization of reserve imbalances over the estimated remaining life of each rate category. It is the opinion of Foster Associates that the currently approved system will remain appropriate for Union, provided depreciation studies are conducted periodically and parameters are routinely adjusted to reflect changing operating conditions. Although the emergence of economic factors such as restructuring and performance based regulation may ultimately encourage abandonment of the straight-line method, no attempt was made in the current study to address this concern.

It is also the opinion of Foster Associates that amortization accounting currently approved for selected general support asset accounts and Account 47400 (Regulators) is consistent with the goals and objectives of depreciation accounting and remains appropriate these plant categories.

The treatment of amortization accounts in the current study was designed to produce annualized accruals equivalent to applying a rate equal to the reciprocal of an amortization period to average plant balances after retirements have been recorded. Applying a rate equal to the reciprocal of the amortization period to plant balances prior to posting retirements would overstate the annualized amortization expense by a half-period accrual on vintages that will be retired during the study year. Accrual rates contained in Statement A should be applied to current plant balances. Accrual rates equal to the reciprocal of the amortization period should be applied to average plant balances after retiring vintages that have achieved an age equal to the amortization period.

STATEMENTS

INTRODUCTION

This section provides a comparative summary of depreciation rates, annual depreciation accruals, recorded, computed and redistributed depreciation reserves, and current and proposed service life and net salvage parameters recommended for Union. The content of these statements is briefly described below.

- Statement A provides a comparative summary of current and proposed annual depreciation rates using the straight-line method, vintage group procedure, remaining-life technique.
- Statement B provides a comparison of the current and proposed annualized 2017 depreciation accruals derived from the depreciation rates developed in Statement A.
- Statement C provides a comparison of recorded, computed and redistributed reserves for each rate category at December 31, 2016.
- Statement D provides a summary of the investment and net salvage components of rebalanced reserves.
- Statement E provides a summary of the components used to obtain weighted average net salvage rates.
- Statement F provides a computation of the estimated future net salvage rate for Local Storage plant.
- Statement G provides a comparative summary of current and proposed parameters and statistics including projection lives, projection curves, average service lives, average remaining lives, and average and future net salvage rates.

Current depreciation accruals shown on Statement B are the product of plant investments at December 31, 2016 (Column B) and current depreciation rates shown on Statement A. Similarly, proposed depreciation accruals shown on Statement B are the product of the year-end 2016 plant investments and proposed depreciation rates shown on Statement A. The proposed remaining life accrual rates (Statement A) are given by:

$$\text{Accrual Rate} = \frac{1.0 - \text{Reserve Ratio} - \text{Future Net Salvage Rate}}{\text{Remaining Life}}$$

This formulation of a remaining-life accrual rate is equivalent to:

$$\text{Accrual Rate} = \frac{1.0 - \text{Average Net Salvage}}{\text{Average Life}} + \frac{\text{Computed Reserve} - \text{Recorded Reserve}}{\text{Remaining Life}}$$

where Average Net Salvage, Computed Reserve and Recorded Reserve are expressed in percent.

ANALYSIS

INTRODUCTION

This section provides an explanation of the supporting schedules developed in the Union depreciation study to estimate appropriate projection curves, projection lives and net salvage statistics for each rate category. The form and content of the schedules developed for an account depend upon the method of analysis adopted for the category.

This section also includes an example of the supporting schedules developed for Account 47800S – Distribution Meters. Documentation for all other plant accounts is contained in the study work papers. The supporting schedules developed in the Union study include:

Schedule A – Generation Arrangement;

Schedule B – Age Distribution;

Schedule C – Plant History;

Schedule D – Actuarial Life Analysis;

Schedule E – Graphics Analysis; and

Schedule F – Historical Net Salvage Analysis.

The format and content of these schedules are briefly described below.

SCHEDULE A – GENERATION ARRANGEMENT

The purpose of this schedule is to obtain appropriate weighted-average life statistics for a rate category. A weighted-average remaining-life is the sum of Column H divided by the sum of Column I. A weighted average life is the sum of Column C divided by the sum of Column I.

It should be noted that the generation arrangement does not include parameters for net salvage. Computed Net Plant (Column H) and Accruals (Column I) must be adjusted for net salvage to obtain a correct measurement of theoretical reserves and annualized depreciation accruals.

The following table provides a description of each column in the generation arrangement.

Column	Title	Description
A	Vintage	Vintage or placement year of surviving plant.
B	Age	Age of surviving plant at beginning of study year.
C	Surviving Plant	Actual dollar amount of surviving plant.
D	Average Life	Estimated average life of each vintage. This statistic is the sum of the realized life and the unrealized life, which is the product of the remaining life (Column E) and the theoretical proportion surviving.
E	Remaining Life	Estimated remaining life of each vintage.
F	Net Plant Ratio	Theoretical net plant ratio of each vintage.
G	Allocation Factor	A pivotal ratio which determines the amortization period of the difference between the recorded and computed reserve.
H	Computed Net Plant	Plant in service less theoretical reserve for each vintage.
I	Accrual	Ratio of computed net plant (Column H) and remaining life (Column E).

Table 2. Generation Arrangement

SCHEDULE B – AGE DISTRIBUTION

This schedule provides the age distribution and realized life of surviving plant shown in Column C of the Generation Arrangement (Schedule A). The format of the schedule depends upon the availability of either aged or unaged data. Derived additions for vintage years older than the earliest activity year in an account for unaged data are obtained from the age distribution of surviving plant at the beginning of the earliest activity year. The amount surviving from these vintages is shown in Column D. The realized life (Column G) is derived from the dollar years of service provided by a vintage over the period of years the vintage has been in service. Plant additions for vintages older than the earliest activity year in an account are represented by the opening balances shown in Column D.

The computed proportion surviving (Column D) for unaged data is derived from a computed mortality analysis. The average service life displayed in the title block is the life statistic derived for the most recent activity year, given the derived age distribution at the start of the year and the specified retirement dispersion. The realized life (Column F) is obtained by finding the slope of an SC retirement dispersion, which connects the computed survivors of a vintage (Column E) to the recorded vintage addition (Column B). The realized life is the area bounded by the SC dispersion, the computed proportion surviving and the age of the vintage.

SCHEDULE C – PLANT HISTORY

An Unadjusted Plant History schedule provides a summary of recorded plant data extracted from the continuing property records maintained by the Company. Activity year total amounts shown on this schedule for aged data are obtained from a historical arrangement of the database in which all plant accounting transactions are identified by vintage and activity year. Activity year totals for unaged data are obtained from a transaction file without vintage identification. Information displayed in the unadjusted plant history is consistent with regulated investments reported internally by the Company.

An Adjusted Plant History schedule provides a summary of recorded plant data extracted from the continuing property records maintained by the Company with sales, transfers, and adjustments appropriately aged for depreciation study purposes. Activity year total amounts shown on this schedule for aged data are obtained from a historical arrangement of the data base in which all plant accounting transactions are identified by vintage and activity year. Ageing of adjusting transactions is achieved using transaction codes that identify an adjusting year associated with the dollar amount of a transaction. Adjusting transactions processed in the adjusted plant history are not aged in the Company's records or in the unadjusted plant history.

SCHEDULE D – ACTUARIAL LIFE ANALYSIS

These schedules provide a summary of the dispersion and life indications obtained from an actuarial life analysis for a specified placement band. The observation band (Column A) is specified to produce a rolling-band, shrinking-band, or progressive-band analysis depending upon the movement of the end points of the band. The degree of censoring (or point of truncation) of the observed life table is shown in Column B for each observation band. The estimated average service life, best fitting Iowa dispersion, and a statistical measure of the goodness of fit are shown for each degree polynomial (First, Second, and Third) fitted to the estimated hazard rates. Options available in the analysis include the width and location of both the placement and observation bands; the interval of years included in a selected rolling, shrinking, or progressive band analysis; the estimator of the hazard rate (actuarial, conditional proportion retired, or maximum likelihood); the elements to include on the diagonal of a weight matrix (exposures, inverse of age, inverse of variance, or unweighted); and the age at which an observed life table is truncated.

Estimated projection lives (Columns C, F, and I) are flagged with an asterisk if negative hazard rates are indicated by the fitted polynomial. All negative hazard rates are set equal to zero in the calculation of the graduated survivor curve. The Conformance Index (Columns E, H, and K) is the square root of the mean sum-of-squared differences between the graduated survivor curve and the observed proportions surviving. A Conformance Index of zero would indicate a perfect fit.

SCHEDULE E – GRAPHICS ANALYSIS

This schedule provides a graphics plot of a) the observed proportion surviving for a selected placement and observation band; b) the statistically best fitting Iowa dispersion to the observed proportion surviving using projection lives derived from the graduation of hazard rates; and c) the projection curve and projection life selected to describe future forces of mortality compared with current projection-life curves.

The graphics analysis also provides a plot of observed hazard rates and graduated hazard functions for a selected placement and observation band. The estimator of the hazard rates and weighting used in fitting orthogonal polynomials to the observed data are displayed in the title block of the displayed graph.

SCHEDULE F - HISTORICAL NET SALVAGE ANALYSIS

This schedule provides a moving average analysis of the ratio of realized net salvage (Column I) to the associated retirements (Column B). The schedule also provides a moving average analysis of the components of net salvage related to retirements. The ratio of gross salvage to retirements is shown in Column D and the ratio of cost of removal to retirements is shown in Column G.

ENBRIDGE GAS INC.

Answer to Interrogatory from
Ontario Energy Board Staff (STAFF)

Interrogatory

Reference:

Ref 1: Exhibit 4, Tab 5, Schedule 1, pp. 3-4

Ref 2: Exhibit 4, Tab 5, Schedule 1, Attachment 1 – Depreciation Study

Question(s):

In Schedule 1 Enbridge Gas discusses depreciation methods and procedures used in the Depreciation Study.

- a) Please confirm that the proposed methodology uses the ELG procedure (other than accounts that use amortization accounting), with a Remaining Life technique.
- b) Please confirm that the depreciation study has generally adopted EGD's depreciation methodologies generally (straight-line method, group procedures, remaining life technique, CDNS net salvage) but with two exceptions: First, the ELG procedure rather than the Average Life Group/Average Service Life (ALG/ASL) procedure. Second, the use of amortization accounting for some groups of assets. If not confirmed, please provide a detailed explanation as to why this is not confirmed.
- c) EGD previously used the ALG method, and other Ontario utilities (e.g. Ontario Power Generation in EB-2020-0290 and Hydro One Networks Inc. in EB-2021-0110) use the ALG method of depreciation. Please provide a detailed rationale for the adoption of the ELG procedure rather than the ALG procedure. Please include an explanation on whether there are circumstances specific to Enbridge Gas that renders the ALG method of depreciation less appropriate, or the ELG method more appropriate.
- d) Please provide examples, if Enbridge Gas or Concentric are aware, of utilities that use the ELG method, the ALG method, or the Generation Arrangement method, in North America, specifically noting which use a Whole Life technique and which use a Remaining Life technique.
- e) Please provide a version of the Concentric Depreciation Study's Table 1 (Concentric Depreciation Study page 5-2) and Section 8 for each of the following:
 - i. Using the ALG procedure
 - ii. Using the ELG procedure with a Whole Life technique

- iii. Using the ELG Procedure with a Whole Life technique, with remaining lives calculated on the basis the ALG procedure.

Response:

The following response has been provided by Concentric Energy Advisors, Inc.:

- a) Confirmed.
- b) Confirmed.
- c) This study incorporated the use of the Equal Life Group (also known as “Unit Summation”) procedure. In this procedure, the plant account is subdivided according to the estimated remaining service lives within the account. The relative size and life expectancy of each equal life group is determined from the survivor curve for the plant account. This results in each equal life group having the same life characteristics as a single unit of plant. In the Equal Life Group (ELG) procedure, the cost of each unit of plant is theoretically fully accrued by the time of its retirement.

The ELG procedure has long been recognized as the most precise procedure by depreciation authorities, and has been advocated in various texts, periodicals and technical papers. Particularly, this procedure received favorable attention in Iowa Bulletin 155 published in 1942 stating:

“The unit summation procedure of the present worth method is shown to be the only mathematically correct method. It is not admitted that more than one correct method exists for applying an average life ratio to property groups when estimating depreciation. Recognition is given, however, to the convenience of the average-life and probable life procedures at the sacrifice of the accuracy in the mathematical calculations.”¹

The Average Service Life (ASL) procedure was widely used through to the late 1970’s, due mainly to the extensive data requirements and mathematical calculations required for ELG. With the development of computer programs to execute the ELG procedure, and as Plant Accounting systems were computerized, the complexity of the mathematical calculations and extensive data requirements became significantly less burdensome. Due to this increased ease of execution and the enhanced accuracy, several regulated companies have converted to ELG procedures since the early 1980’s.

¹ Robley Winfrey; Depreciation of Group Properties; Engineering Research Institute; Iowa State University; Ames, Iowa; 1942, page 6.

The use of ELG provides a more equitable distribution of depreciation expense to the current users of the gas system because the provision for depreciation at any given time is based only on the assets in service at that time. Conversely, the ALG grouping procedures results in depreciation accruals that in later years contain an incremental component of depreciation expense to compensate for the lower levels of accruals in early years. This idiosyncrasy of ALG grouping procedures has long been recognized as a deficiency by various authorities on depreciation analysis.

Specifically in the circumstances of Enbridge Gas, the above generational equity concerns are particularly relevant given the energy policy requirements that are emerging in the natural gas utility sector. As such, the ELG calculations which more closely align the depreciation rates to the retirement dispersion patterns inherent in the lowa curve selections, will lessen the impact to customers from any type of energy transition, thereby reducing the impact of potential future carbon-based energy policies. In contrast, the use of the ALG procedure for an electric distribution utility such as Hydro One incorporates less risk of intergenerational concerns for future customers. Overall, the introduction of fossil fuel restrictions will likely increase the demand upon electric utilities, thereby mitigating the capital expenditure impact that could be required by urban electric utilities. As such, this increased demand also mitigates the need to maintain the use of the Generation Arrangement or ELG procedures for an electric distribution utility such as Hydro One, or OPG.

With the harmonization of the legacy Enbridge Gas Distribution and Union Gas systems, a review of the appropriate depreciation procedure to be used for the combined company was conducted. Union Gas had historically used the Generation Arrangement procedure, which as noted at page 3-4 of the Concentric depreciation study report, closely aligns to the results of calculations made with the ELG procedure. Given the issues with the use of the Generation Arrangement as described at pages 3-3 and 3-4 of the Concentric depreciation study report, and that the Generation Arrangement requires retirement transactions through the entire life of the account, which was not available from legacy Enbridge Gas Distribution system the use of the Generation Arrangement procedure was not considered as a viable option. However, as the concepts inherent in the ELG procedure are closely aligned to the concepts inherent in the Generation Arrangement procedure, Concentric placed higher consideration on the ELG procedure when selecting the appropriate depreciation procedure.

Overall, Concentric views that the use of the ELG procedure for this EGI study has two significant advantages as compared to the use of the ALG procedure. Firstly, the use of the ELG procedure was the best available match to the historic procedures approved for Union Gas. Secondly, given the potential changes in use of fossil fuels and the unknown impact of such change on the Enbridge Gas system, the use of the ELG procedure best reduced the future risk of intergenerational inequity.

d) Concentric is aware of the following utilities using the ELG whole life method with variances in the accumulated depreciation true up over the composite remaining life:

- FortisAlberta;
- ENMAX Power Corporation;
- APEX Utilities;
- ATCO Gas;
- AltaLink;
- ATCO Electric;
- City of Lethbridge;
- City of Red Deer;
- SaskEnergy;
- TransGas; and
- Yukon Electrical Company Limited.

Concentric is aware of the following utilities using the ELG remaining life method:

- Gazifere;
- IntraGaz;
- Eastward Energy; and
- NB Power.

Concentric is unable to confirm any utilities currently using the Generation Arrangement, however Concentric understands that it is widely used by Fosters & Associates in the United States.

The majority of remaining studies in Canada are completed using the ALG method with either a whole life or remaining life true up. ALG Remaining Life is also the most widely used method within the United States.

e)

i. Please see Attachment 1 for Table 1 and Attachment 2 for Section 8 using the ALG Remaining Life procedure.

ii. & iii. Please see Attachment 3 for Table 1 and Attachment 4 for Section 8 using the ELG Whole Life procedure with remaining lives calculated on the basis of the ALG remaining life procedure. Doing the depreciation calculations using the ELG procedure with only ELG Whole Life used will not include any true up for accumulated depreciation variances, and as such, be incomplete. Therefore, Concentric has provided just the ELG Whole Life results with the ALG Remaining Life procedure.
